As I have been in the habit of prescribing euonymus almost exclusively for lingering disorders of the digestive organs, and in the form of the fluid extract, it is of its therapeutical effects under such circumstances that I am able to write understandingly. Taken in appropriate doses, the immediate effects are slightly stimulant, almost like an exhilarant, which may last from one to three or four hours. Not, be it understood, similar to alcoholic stimulation, but a far milder and more durable feeling of vigor—not succeeded by the reaction of depression. The effect is far more like a quick acting tonic. In thinking of this, however, I am at a loss to discern whether this subordinate effect is really the outcome of an enhanced exaltation of vital action, or whether the more potent effects of a proper dose, in slightly morbid states, may not arise from its virtues in freeing the *primæ viæ* of the depression of inaction, or from the presence of effete matters inimical to a buoyant life. Be this as it may, the heavy, languid depression, the indisposition to mental or muscular action, often disappear like magic, in certain morbid states of the digestive organs, under its influence.

Taken in doses of half a drachm to a drachm, according to individual susceptibility, before breakfast, the euonymus acts as a gastric tonic, cholagogue and mild cathartic, and usually within two hours after its administration. Its action is unattended by nausea, griping, or any debilitating influence. This is its effect, not in the stereotyped, vague expression, on some, but on those in whom there has been present a more or less lingering gastric, hepatic and intestinal torpor. Administered to subacute cases of functional inactivity of those parts, the dose sometimes has to be repeated every three or four hours before desirable action is reëstablished, when the effect is far more that of an active, frequently repeated cathartic. The stools indicate the large presence of bile, and of the feculent secretion of the intestinal follicles. It does not cause, like podophyllin, violent vermicular motions of the stomach and bowels, thereby producing nausea, griping, and large discharges of gelatinous mucus, through irritant action. It is preëminently the most unobjectionable of cathartics to overcome habitually loaded abdominal viscera, not, however, in acute exacerbations, but in those of a more lingering character. Especially is it of eminent service when, from a variety of causes, hepatic and intestinal torpor are conjoined. In these instances it should not, of course, be given more than once daily, and in amount sufficient to produce not more than one or two evacuations. Continued use does not habituate and blunt the system to its energy, consequently the dose does not require to be increased; in fact, as a rule, rather decreased.

For habitual constipation, two rules should be observed in its administration: first, to give only

*By the way, the "Ohio idea" is very general among the practical men of this section, that the physicians of the west are far more progressive and advanced in the practice of medicine than their more conservative brethren of the east, though in surgery the palm must be yielded to the latter; and that by and by the former will run the practice of medicine, just as they now do the Government.

enough to produce one or, at most, two evacuations per day; second, to order it to be taken with regularity at a certain time of each diurnal period. In the morning before breakfast is that usually preferred. The objects of these rules are to avoid begetting debility by over action, and to establish a habit of regular feculation. Of course, special indications require special combinations, of which nux vomica, in certain states of motory enervation, is an example; but for ordinary and simple cases the following is a convenient form:—

℞. Ex. euonymi, fluid, f. ℥ iij
Syr. aurantii, f. ℥ j. M.

Sig.—One teaspoonful before breakfast.

If the debility and torpor are somewhat extreme, a dose may be taken before each meal, in which case half a teaspoonful is almost always amply sufficient.

From careful comparison, the euonymus has precisely the same therapeutic virtues as the so-called cascara sagrado, only decidedly more active, not only as a tonic, but as a corrector of hepatic languor and defective intestinal secretion. In large doses it is capable of a hydragogue effect, perhaps less distressing and prostrating than almost any other agent producing a like effect. It is here proper to remark that the fluid extracts in the market are of unequal strength. That of Parke, Davis & Co., for instance, prepared, apparently, from the bark of the tree, is only half the strength of that prepared by Wyeth & Co., extracted from the bark of the root. It is of the latter on which my observations are founded.

In summing up, it may be said that in euonymus we have an invaluable gastric tonic, mild cholagogue, pleasant laxative, or cathartic, according to the dose. It is admirably adapted for correcting deficient secretion and excretion of the intestinal follicles, for toning gastric atony of a non-inflammatory type, and for accelerating biliary outflow, and so ridding the system of the depressing effects of an almost habitual hydrocarbonaceous excess. It is not a diuretic, nor an alterative, any more than any remedy with similar gross effects is an alterative. It is not, as a rule, adapted to the treatment of acute, or even subacute diseases, but for many of the lingering forms it is simply invaluable; and to those who have long used the euonymus and its congeners, and know their great value, the enthusiasm of some as to the rhamnus purshina as a remedy of unique qualities provokes a smile at the poverty or backwardness of their therapeutical knowledge.

A TERRIBLE BURN AND ITS TREATMENT.

BY C. H. MERRICK, M.D.,
Of Canyonville, Oregon.

I think my recent experience with a severe case of burn will be of service to the profession. The morning after Christmas of last year, Simon Patchen, about fourteen years old, in some unaccountable manner, found his way out of a burning building, where he had been sleeping. In passing through the flames, and feeling his way down stairs, he was shockingly burned. I saw him about an hour after his escape. He was screaming with agony. Without stopping to examine the extent of his injuries, I immediately plastered him from head to foot with a thin poultice of ground slippery elm and pulverized charcoal. Relief from pain was almost instantaneous; so marked was this that I began to fear collapse and death.

This respite gave me time to think, and during the next twelve hours I endeavored to ascertain how badly my patient was burned. But it was not until the second or third day that I fully realized the extent of his injuries. I then made up my mind that the chances for recovery were exceedingly small. Looking at one of his hands, and planning as to what method to adopt in its amputation, I finally put it down, and said to myself: "Wait awhile. Death will soon end his sufferings." The boy was in a terrible condition, truly. With the exception of his chest and abdomen, and the inside of his thighs, he was burned all over. For more than a week I continued to apply the charcoal poultices. Gradually I substituted the ointment so much praised by Dr. A. D. Binkerd (see Medical and Surgical Reporter, July 9, 1870), using on parts of the body the glycerine and carbolic acid treatment.

Of course, every surgeon of experience knows that no uniform line of treatment can be followed in extensive burns. I need only mention the different articles I have employed, according as the circumstances demanded. I used chloral hydrate externally and internally with good effect. Belladonna, locally, quieted nervous spasmodic twitchings. Soda sulphas I found to be an excellent topical application, subduing inflammation, and, I think, repressing exuberant granulations. Permanganate of potassa washes were applied as a disinfectant. It is proper to caution the younger members of the profession in regard to carbolic acid. The tendency is to use a too strong solution. I am satisfied I committed that error once or twice in this case.

To those of your readers who may not have the number of the Reporter referred to, I will state that an ointment made of beeswax, mutton tallow and linseed oil or glycerine, in such proportions as will secure a soft, pliable mixture, should ever be ready in the treatment of burns. Such an ointment forms the foundation of various other varieties likely to be wanted, such as the addition of tannin, bismuth, carbolic acid, belladonna, plumbi acetas, etc., will produce. Another caution: Resist the temptation to remove dressings unless they are perfectly free. Never use any force in their removal; rather allow them to slip off themselves, then apply immediately appropriate new dressings.

An attempt was made to use oakum, but owing to the coarse quality at hand the result was not satisfactory. I am inclined to believe, however, that finely carded oakum would be preferable to cotton in the treatment of suppurating surfaces.

My patient, now in the eleventh week, is nearly well, a narrow strip on his thigh being the only uncicatrized spot. His hands are thin and scrawny, but bid fair to be of service to him. It is no exaggeration to say that not one case in a thousand so badly burned ever escaped with life; and it is a wonder to all who saw the boy during the first week, that so few traces of shrinking and ugly deformity, the usual result of severe burns, remain.

CHLOROFORM IN CONVULSIONS OF INFANTS AND CHILDREN.

BY J. D. BLAKE, M.D.,

Of Baltimore, Md.

Certain it is, that we are called upon to treat few diseases that are more formidable or more fatal than convulsions of infants and children. The great number of deaths from convulsions, especially of infants, which we constantly find in all of our mortality returns, I think will bear witness to the above statement, for correctness. Not desiring, however, to enter to any great extent upon the question of the nature of the different types or forms of convulsions of early life, I shall content myself at this time with referring to the general opinion of pathologists of the present day, that by far the greatest proportion of infantile convulsions are sympathetic or functional merely. "The grand reason (says Dr. West) of their frequency is, no doubt, to be found in the preponderance or predominance of the spinal over the cerebral system in early life. Thus it is, that in a large majority of cases of convulsions we find the cause due to some morbific agent acting upon some distant excitant surface or part, as the teeth, stomach, bowels, etc., there being, as a rule, no organic lesions found after death." Consequently, in cases of infantile convulsions, particularly when of a sympathetic, reflex or eccentric type, after removing all traceable exciting source of irritation, and diminishing as far as possible any excess of vascular action in the nervous centres, physicians have generally proceeded to combat the disease, if it still persisted, with medicinal agents, that tended to reduce the super-irritability of the excito-motory system, or otherwise to restore it to a proper and healthy standard of action.

To fulfill this indication, preparations of different kinds have been used, such as chloral, bromide of potassium, the different preparations of opium, hyoscyamus, and other antispasmodics too numerous to mention. And yet, notwithstanding these and the long list of other preparations used and recommended by physicians, we are constantly called to cases of infantile convulsions over which these remedies seem to exert but little, if any, control; indeed, in a large number of cases we find it an impossibility to administer any medicine whatever, from the continued muscular jerking and spasm of the jaws. In such cases it is customary to look to the condition of the skin, bowels, head, etc.: thus we use enemata, warm baths, cold to the head if indicated, and sometimes when not. This is all that is left us to do, and this, in many instances, rather to relieve the great anxiety of the parents and relatives, than the condition of the patient. There is no doubt that there is a goodly number of cases relieved or moderated by such remedies as above spoken of. But these are not the cases of which I wish to speak at this time. It is of those cases which we find do not yield to such remedies; in other words, the chronic or subacute form of convulsions, which, on account of their duration, exhaust the little patient to such an extent as to prevent its recovery, even if it should outlive the convulsions.

In order that I may more fully explain myself, I shall relate a few cases, selected from fourteen, in which I have taken special note, and in which I have used chloroform with so much benefit to my little patients and satisfaction to myself.

Case 1.—March 13th, 1877, I was called, about three P.M., to see a little son of Mr. K., eight months old. When I arrived at the home of my patient I found him in violent convulsions, affecting, at that time, both sides, at other times only one side. Upon inquiring, I was informed by the mother that Dr. I., their family physician, had

been called early in the day, and had prescribed for the patient, gave it an enema and a warm bath, after which he left, saying that the convulsions would soon cease. The Doctor was giving one-twelfth grain of calomel, with one grain of sugar, every half hour. In addition to this, he ordered potassium bromide and chloral, with tincture of hyoscyamus and syrup, to be given in half teaspoonful doses every hour, if the clenched teeth or convulsion did not prevent, which they did, consequently none of the medicine could be given. Finding the convulsions did not cease, the mother gave it a mustard bath, applied mustard to the spine, feet, hands, legs, etc. Notwithstanding all this the convulsions continued, more violent at times than at others. The patient at this time was bathed in perspiration; pulse so rapid that to count it was impossible; pupils dilated. Knowing that he was becoming rapidly exhausted, I immediately ordered half an ounce of Squibb's chloroform, which I allowed him to inhale from my handkerchief until he was perfectly relaxed and the convulsive movement had entirely ceased, which I do not think took more than two minutes from the time I commenced the inhalation. The pulse now became more regular and full, the breathing was calm and easy, and the child passed into a sweet sleep, from which it did not awake for thirty-six minutes, at which time I noticed a slight twitching of the muscles of the face and eye. I again applied the handkerchief, only allowing him to take an occasional whiff, when he again fell into a quiet sleep, and remained so for three-quarters of an hour. In the meantime Dr. I. arrived, and seemed somewhat surprised to find that his prescriptions had failed to relieve the child, but expressed satisfaction with the result of chloroform in the case. He said he had never used it in such cases, but thought he would in future when such cases presented themselves. I then resigned the patient to Dr. I., who told me next morning that he had no further trouble. The patient, he said, awoke much refreshed, took a little nourishment and went off to sleep again, from which he did not awake for two hours. He made a rapid recovery.

Case 2.—On the night of June 17th, 1878, I was summoned in great haste to see a fourteen months old daughter of Mr. L. B., who, I was informed upon arriving, had been in convulsions since early in the afternoon; their family physician, who was a homœopath, had used all of his remedies without benefit; in addition, the child had been put in a warm mustard bath, an enema had been given, the bowels had moved freely, it had vomited after an emetic had been given, and yet the convulsions continued, and at times very violent; so much so that the physician gave the case up as hopeless, saying it could not recover. I used chloroform here as in the other case, with almost equal success. The child having been placed thoroughly under the influence of the anæsthetic, I found the pupils, which were widely dilated, had contracted down almost to the normal condition; the pulse, which was thread-like and so quick that I could not count it, became full and much slower; the respiration became slower and more natural. In this case, however, I had to renew the inhalations three times, as the convulsive movements would return as the effect passed away. On the third application of the inhaler, however, the child remained asleep for more than an hour, when it awoke, with no return of the convulsions, took a little water, went off to sleep again, arousing two and a half hours later. With the exception of being restless and a little fretful, she made a rapid recovery. Now, there are many other cases that I might relate, but this I think will suffice to prove the efficacy of chloroform in such cases; and especially so, as all the usual remedies had been used without success.

There is another class of cases in which I think chloroform serves both to control the convulsive movements and aid materially in making our diagnosis. The following case will illustrate my meaning: I was called January 2d, about 1 o'clock, A.M., to see a nine-year-old son of Mr. L., who was taken with convulsions about midnight. The cause was unknown, as he had never had convulsions before. I ordered an enema, also a warm bath, in addition to one he had received before my arrival. The bowels moved freely; the convulsions continued without the slightest abatement; I could get nothing into his mouth. I ordered chloroform, which I used as before, always keeping up the inhalation until the convulsive movements ceased entirely. When this took place, however, in this patient, I had the satisfaction of seeing him become excessively nauseated, followed by copious vomiting. Upon examination of the matter vomited, I found it to contain large quantities of *peanuts*, pieces of candy, and undigested food, which the boy had obtained the evening before by visiting his grandparents without the knowledge of his parents. After the stomach was evacuated the boy had no more convulsions, but was able to get up and play around the next morning. Now, had I known the cause of the convulsions, or the contents of the stomach, I

know of no means by which I could have administered an emetic which would have acted so promptly, so easily and so satisfactorily as did the chloroform.

It is a well known fact that chloroform possesses the property of diminishing the power of the nerves in receiving and communicating, and of the brain in perceiving, sensation, whether arising from internal or external causes; it further arrests the reflex action of the spinal cord. This being its action, we do not think the day far distant when chloroform will be universally recognized as the remedy par excellence in convulsions of infants and children.

METEOROLOGY AND EPIDEMICS.

BY P. J. FARNSWORTH, M.D.,
Of Clinton, Iowa.

The meteorological element of epidemic disease has been frequently studied, but the data have not been sufficient, and its importance has not been well enough considered. This seems to me apparent in the reports and investigations in regard to yellow fever.

Malaria is generated by heat and moisture. It arises in low, marshy districts, and also in new countries, where a large amount of vegetation is decomposing under the influence of rains and continued heat. Marshes in hot weather breed the poison producing ague and intermittent fevers, and so, also, do the prairie and woodlands, under the influence of high temperature and frequent showers.

I have resided in the eastern part of the State of Iowa for the past fifteen years, and have, for the greater part of the time, kept a meteorological journal, and also noted prevailing diseases. The heated term occurs in July, and five or six of the years have been characterized by excessive heat. There are no marshes in the vicinity, and the malarial diseases seem to come from the other condition mentioned.

During the very hot and dry weather the health of the community is very good. The temperature moderates and there follows a showery season, sometimes a large rainfall, at others not copious, but frequent; malarial diseases then become prevalent, and are a factor in all the cases to which we are called. In 1866 the germs of cholera were added, and we had numerous cases in 1869. Typho-malarial fevers were very prevalent. In 1872 we had such conditions, and ague and intermittent fever, in a mild or severe form, attacked two-thirds of the people of the city. It prevailed over the State, and in many places was complicated with typhoid.

The summer following (1873) the same atmospheric conditions were present, and malarial and typho-malarial fevers prevailed, but not in so marked a degree as in the previous season. There then followed some cool summers, and we had no epidemic of malarial fever until the season of 1878. July was characterized by extreme heat, followed by a dry month of August. Malarial fevers, of a mild type, were very prevalent during that month and part of September.

Prof. Henrichs, of the State University, has an organized system of weather reports from some seventy stations in different parts of the State, which showed a very unequal distribution of the rainfall. In some parts of the State it was excessive. Some circulars were addressed to physicians at the weather stations, inquiring of them about prevailing diseases during the months of July, August and September. July was a very healthy month, but August and part of September showed a general prevalence of ague, intermittent and typho-malarial fever. The drier portions of the State suffered equally, evidently because the atmosphere in other portions was largely contaminated with the germs of malaria, which extended. In places where sanitary conditions were bad, diarrhœa, dysentery and typho-malarial fevers were reported. The summer complaints of children do not seem to be governed by these atmospheric conditions to any great extent.

As a rule, in the State, a general depression of temperature follows toward the last of August, which in ten years out of fifteen has culminated in a frost at the end of the month, or during the first week of September; if this is followed by continued lower temperature the epidemic of malarial fever ceases. If the temperature rises the fevers increase, and are not checked until the next cold wave, which comes during the third week of October. In this vicinity we had a slight frost during the last week of August, which put an end to our cases of intermittent, which did not again appear, as the temperature continued moderate. In the season of 1869 there was no frost in August or September, and our severe epidemic of typho-malarial fever continued until the last of October.

The inferences are that extreme hot and dry weather is healthful, but moisture added, engenders epidemics of malarial fever, which are checked by the appearance of frost. If with this intermittent type there is introduced a germ of typhoid, or a poison producing diarrhœa or

dysentery, we have a more virulent element added to the prevailing epidemic. That in the area of a State, or perhaps several, if the malarial influence springs up in a part, it affects all the adjacent territory.

In examining the reports from the countries where yellow fever prevailed this season, we find that June and July were unusually hot months, with rainfall, especially in July and August. Intermittent fever prevailed in a very severe form; yellow fever was brought from abroad and was added to the prevalent epidemic, just as in some seasons typhoid comes in with us to complicate or make our epidemic typho-malarial. At the south the heat and rainfall began early and made the country soon ready for the planting and growth of the terrible complication. The atmospheric conditions continued late, there being no frost or cold until November, to check its progress.

We had no yellow fever in this latitude, because it did not travel fast enough to reach us before the frost came to check the epidemic that made a ground on which to plant the disease. In 1855 I witnessed the advent of yellow fever into one of the cities of central Mississippi. The season for several months had been hot and dry; in August there was a heavy rain; many cases of intermittent fever followed; soon people came flying from New Orleans, and other infected districts, and the fever assumed a new and malignant type, which was soon pronounced yellow fever in earnest. This terminated with the first frost, which came the first week in October. There was the usual mortality while it continued.

It is probable that sanitary measures may prevent the introduction of a typhoid element into our epidemics, but wide areas of uncultivated lands, and even the cultivated fields, where such atmospheric conditions arise, yield the germs of malarial fever, that cannot be suppressed or avoided.

The commission appointed to investigate yellow fever reported, what was undoubtedly correct, that rigid quarantine would keep it out; sanitary measures would modify its virulence, and might also prevent the malignancy of the prevailing intermittent and the superinduction of typhoid or other kindred poisons. To make their report complete, the meteorological element should be taken into account, and sanitary means and prophylaxis should be used against the malarial epidemic, and this, with quarantine, might not only prevent the spread of yellow fever, but also greatly modify the usual summer sickness and mortality in those States.

Hospital Reports.

PENNSYLVANIA HOSPITAL.

CLINIC OF PROF. J. M. DA COSTA.

REPORTED BY FRANK WOODBURY, M.D.

Cases Illustrating the Principal Varieties of Bright's Disease. Differential Diagnosis, Complications, Pathology, and Treatment.

Gentlemen:—It happens that there have been, of late, an unusually large number of cases of renal disorder in the wards, some of which will fairly illustrate the characteristic features of the ordinary varieties of Bright's disease of the kidneys. I thought it well to have several of these patients brought before you this morning, in order to devote the hour to considering and contrasting their clinical features; and in conclusion, I hope to deduce some general principles that will serve to guide you hereafter in the treatment of these disorders, and aid you to a marked extent in warding off their evil consequences.

Acute Tubal Nephritis.

Here is the first case to which I will call your attention:—

Peter McA., born in Ireland, a waiter, 40 years of age; was admitted two months ago, suffering with ascites and general œdema, which had followed exposure to cold and wet about four weeks before. He had been previously well; in truth, he had always considered himself a healthy man; he is of temperate habits, and never contracted venereal disorder. He lost his parents early; one brother died of consumption. In the present illness the first symptom noticeable was swelling of the ankles, which was accompanied by loss of strength. Questioned upon this point, he says that he believes he did not pass as much urine as he had previously, and at times he noticed that it was dark colored. We have no evidence of his ever having had hematuria. Upon admission, it was found that he had difficulty in breathing, amounting at times to orthopnœa, and there was a small pleural effusion. The legs were very much swollen; the abdomen greatly enlarged; the face was pale and puffy. His urine was loaded with albumen, and contained an abundance of pale epithelial and hyaline casts, the daily excretion being only one pint and a half.

It is unnecessary that I should detail to you his progress, step by step, or dwell further upon the early history of the case. Suffice it to say that the fluid in the peritoneal cavity, the effusion in the chest, and the œdema of the legs, have all disappeared under treatment. It was a case, then, of general dropsy, following exposure to cold. So general was the dropsy that in addition to the ascites and œdema of the chest walls, there was an effusion in the left pleura, and the physical signs also indicated some excess of fluid in the pericardium. The heart was acting irregularly, losing a beat in every three or four; the apex impulse appeared in the sixth intercostal space; the first sound was muffled and replaced at the apex by a moderately harsh systolic murmur.

He was put upon a pill of squill and digitalis, which was shortly discontinued, and digitalis given alone, in the form of infusion, until, as you

see, the œdema gradually but completely passed away. There is no longer any effusion in the abdomen, no longer swelling of the general surface or of the extremities; no longer any amount of fluid in the pleura or pericardial sac. The urine I now show you. It is pale, nearly clear. Trying the nitric acid test—in the manner we generally resort to in this hospital, of dropping the fluid slowly down the side of the test tube upon the nitric acid; if any albumen be present, an opaque white ring is seen to cover the surface of the acid; this is the most delicate test with which I am acquainted—you observe the thin layer of coagulated albumen which is here, in small amount. We, therefore, say that our patient is still passing albumen with the urine, but only in a moderate quantity. Small tube casts are still found, containing epithelium, and only slightly, if at all, granular.

I will now complete the record by an examination of the lungs and the liver, which will enable you to compare his present condition with the notes you have already taken of his previous condition. As I stated that there had been some evidence of effusion in the pleura and pericardium, I will now investigate this question by percussion and auscultation, or physical examination.

As regards the heart, the first sound is distinct, not muffled, though it still occasionally intermits; just what I find, from the notes, has existed from the first, that is all. Concerning the lungs, the percussion note is resonant, anteriorly and posteriorly, on both sides. I find that there is a slight friction sound under the *right* scapula, not on the left; it may be from a former attack of pleurisy. There is no present effusion. The liver extends one inch below the border of the ribs, but no ascites remains. He now passes water freely, under the use of digitalis and belladonna, which he has been taking for some time.

Let us now proceed to inquire what is the pathology and prognosis of this case? and, secondly, what modification shall we make, if any, in the treatment?

I show him to you as one of the most typical cases of acute Bright's disease of the kidney that could be found, though now almost entirely recovered. When you look upon this case, you see a man who, though apparently in full health, had naturally not much power of resistance to disease; a weakness that we conclude was inherited, for a brother died with consumption, and his parents were not long-lived. We find such a system exposed to cold and wet. Following this the kidneys are disordered in their function, the legs swollen, general œdema appears, with effusion into the great cavities of the body; in short, we have an attack of Bright's disease following exposure; acute, desquamative, tubal nephritis; the same form of renal disorder that is observed to follow scarlet fever. However, in the latter case, you have not necessarily the same accident of exposure to cold; the morbid process in the kidney is part of the clinical history of the disease; here, on the contrary, you have heard a plain statement of a competent cause, in the exposure, followed by a general œdema, with thoracic and abdominal effusion. Indeed, you might make a correct diagnosis from a study of the dropsy alone, but the nature of the disorder is established by an examination of the urine. When first tested it was loaded with albumen—that is the expression, loaded with albumen—and full of tube casts, which were covered with epithelium. There is nothing said here in the notes about the existence of blood cells, which generally accompany the acute stage; perhaps they escaped observation; or had passed away by the time he came under observation.

By the treatment with digitalis and occasional purging, he has recovered. I shall not, just at present, discuss the principles of treatment, as I have a group of cases to show you, and think that you will better understand the theory after you have had an opportunity of contrasting this with the others, when the differences in the treatment will be pointed out and explained.

Shall any change be made in the present case? We shall stop the belladonna, and reduce the digitalis to ten minims of the tincture, three times daily. He shall also have twenty drops of the tincture of iron after meals. Improve the diet, and give him nourishing though plain food, with exercise when the weather is favorable, seeing that he is well protected by proper clothing. This, then, was a case of acute Bright's disease in the stage of convalescence.

Chronic Bright's Disease—Chronic Tubal Nephritis.

This patient's name is Edward C., occupying bed No. 17, of the men's medical ward. He is a salesman. His family history is not very good; his mother died of consumption; and a sister is subject to the same disease. After visiting a malarial region, he had chills and fever, and subsequently was accidentally salivated with mercury. After his return to Philadelphia he was occasionally troubled with constipation, but he had no trouble in urination, except that he had been accustomed for a long time to rise once or twice at night to empty the bladder. After exposure to bad weather, he had some dyspnœa, and nausea, and swelling of the ankles after walking, just as in the preceding case. In this condition he was admitted, a few days ago. His face was pale and waxy. The legs—if we may be permitted to use such a metaphor in speaking of these unwieldy supports—are immensely swollen. I could not present to you a better illustration of what we mean by œdema than you find in these ankles. The hands also have been swollen, and there was some puffiness around the eyes, but very much less than you would expect from the amount of swelling we observe below. As you notice, only a small degree of ascites exists.

What is the condition of the urine accompanying such a state of dropsy? He passes four and one-half pints in the twenty-four hours; therefore an increased amount of urine is discharged. I will proceed to examine the urine before you, as in the preceding case, with nitric acid. Here is the very distinct albuminous ring. The amount of albumen here, not only from this test, but from other examinations, we have found to be very decided. You see a very large, cloudy deposit above the clear nitric acid; a considerable amount, therefore, exists in the urine. Examin-

ation by the microscope reveals granular casts, as in the preceding case; some blood corpuscles are also present, and a few leucocytes or white corpuscles.

We will now examine other points in the case. The impulse of the heart is strong and extended; the percussion dullness is large, but not extraordinarily increased; the first sound is dull, but distinct, somewhat weighty. The vessels of the neck can be seen to throb, therefore there is some evidence of over action of the heart; we could almost say, from this examination alone, that there is beginning cardiac enlargement or hypertrophy, but without valvular disease.

The lungs are clear on percussion; there exists neither pulmonary œdema, nor pleural effusion. I have told you that the amount of ascites is very moderate.

Now, what is the matter with this patient? Here we have a case that fits in very well with the preceding. This, too, is a case of Bright's disease, for only in the kidney can we find the cause of such dropsy as we see here. As we discussed the points, it became evident that we have here a subject in which acute Bright's disease is passing into the chronic form, that of chronic tubal nephritis. Like the first patient, the symptoms here came on after exposure to cold and wet, in a person exposed to malaria and predisposed to consumption. But the symptoms are not those accompanying what we generally call a cold, but the chilling of the skin produced a congestion of the kidneys, which passed into a state of inflammation and denudation of the tubules by causing degeneration and exfoliation of the epithelium, the loss of albumen producing the amount of anæmia which is here present. From the granular character of the cells passed from the kidney we know that there is no longer such an acute affection as we saw in the former patient; yet I do not think that the kidneys have been sufficiently damaged to make us despair of restoring them to a comparatively healthy condition.

We give him—

℞. Tr. ferri chloridi, gtts.xxx.

well diluted, thrice daily, with a nourishing diet, beef tea, eggs and milk, the latter forming the greater part of his diet. He has not been placed upon digitalis; the urine being very copious, I have not thought it necessary to give him any diuretic. In addition to the treatment just laid down, I will order him a drachm of fluid extract of ergot, morning and evening, for reasons which I will give you hereafter.

Chronic Tubal Nephritis, with Uræmia—Treatment of the Complication.

Daniel G., 18 years of age, driver. Here is another interesting case of kidney disorder, which, two years ago, was under my care for this same affection. The notes are lengthy, so I shall not read them, as I am familiar with the general history and main points of the case. He improved very materially, I find, from ergot and the tincture of iron; very much the same treatment that we have just ordered for the previous patient. When he left us he had still some albuminuria, but as he had regained flesh and strength he was anxious to return to his work.

After his discharge he enjoyed good health until five weeks before admission. Then he noticed swelling of his ankles and abdomen, but kept at his work until the swelling and prostration led him back to the hospital. Upon admission, we found him suffering with general œdema. His urine had sp. gr. 1.015, and—please note this—contained a large amount of albumen, with granular epithelial casts. The daily amount of urine was about one pint. Under the treatment he has again improved; he passes more urine, but the casts persist, and the albumen continues in considerable quantity. This is a short statement of a history extending over six months; but I do not wish to detain him very long, as he is too sick. He feels drowsy this morning; he has headache, and has been vomiting. His pupils are large; they react to light, but they respond slowly. The temperature taken this morning was normal, but it shall be observed again during the day. His pulse is 72. You see how dull he is, how drowsy; his face is slightly flushed, from the vomiting, and yet he has what may be described as a clean tongue. He has been passing five pints of urine in the twenty-four hours, but he is not voiding as much to-day; we shall have it measured, to notice the deviation. His bowels are rather loose.

Now, what is this? If he had chronic tubal nephritis when he was under treatment two years ago, it is a case like the former, except that we have now acute symptoms grafted upon a chronic condition. But there are certain symptoms here that belong to a different form of renal disease. What does this headache, dullness, dilated pupils, vomiting and diarrhœa all mean? These are the symptoms of incipient uræmic poisoning. When you have a case of Bright's disease attacked with persistent vomiting, with a clean tongue, and the features just described, it should put you on your guard against blood poisoning, which is threatening and partly developed.

You may say, "I do not understand this. He is said to be passing five pints of urine, and I have been led by the books to believe that when the secretion is free there cannot be uræmic poisoning!" But my observation has been such as to teach me that this view is erroneous.

It is true, as a rule, that you will have scanty urine, but there are many exceptions, and here is one before you. How prove it? An accurate chemical examination will show that the amount of urea and other salts is very much diminished, while the water continues free and relatively increased. The irritation produced by these salts retained in the blood may occur while the quantity of the fluid is kept up. Whether the urea undergoes decomposition into ammonia, and in this way causes the blood change, or the urea itself causes these symptoms, is not for us to inquire into this morning; it is sufficient for us to know that they are present, and call for prompt treatment. He shall take—

℞. Acid benzoic, gr.xx
Syr. tolutani, ʒj. M.

To be given, largely diluted with water, every third hour.

He is to be freely purged; we will give him one drop of croton oil, made up in a pill, to be repeated if the first does not act freely. He shall also have a warm bath, or, if he is too weak, he shall take a vapor bath in bed, by means of hot bricks wrapped in damp towels. The steam will encourage the skin to act freely. We have thus endeavered to stimulate the emunctories, work the bowels by the oil and the skin by the vapor. Why give benzoic acid? Why select this in preference to any other acid (although almost any acid would not make a bad prescription), for counteracting the tendency to uræmic convulsions and coma? The benzoic acid prevents, particularly, the accumulation of the urinary salts in the blood; it is a diuretic in the sense that it influences the excretion of solid material. What did I tell you a few moments ago? That the secreting cells are clogged up while the water is given off. It not only purges the kidneys, excreting the solid constituents which are being retained, but it also, as an acid, prevents the decomposition of these substances which are accumulating in the blood and threatening life.

I am very sorry that I cannot have the time to finish my lecture this morning. As my time is almost up, I will merely show you another case and defer my concluding remarks until the next lecture.

Chronic Tubal Nephritis and Fatty Kidney—Retinitis Albuminurica.

Theodore J., twenty-six years old, inherits a tendency to kidney disease; his father has kidney trouble, and his mother has dropsy. He has had malaria, and has been in poor health for several years; indeed, at ten years of age he had swelling of the feet, lasting a month. He never had scarlet fever, but had typhoid two years ago, and has not felt well since. He has had several attacks of headache, dyspnœa and dropsy, and has not been able to work for six months, although not confined to bed. After an unusually severe attack he came into the wards. He was then weak, and his face was anæmic and puffy, especially about the eyes. His ankles were also swelled, but he had not so much dropsy as the other patients had. The urine had specific gravity 1.010, colorless, and contained less than one-quarter albumen, with hyaline and fatty casts. The quantity varied, after taking Basham's mixture for a few days it was increased to six pints.

As there was some impairment of sight, an examination was made, with the following result: "Eye-ground pale; border of disk indistinct in both eyes. Numerous, highly refractive, white spots on the retina, near the maculæ." He has the condition known as "albuminuric retinitis." This is all the more remarkable, because he does not complain very much of his eyes, and says his sight is pretty good.

The patient has had dropsy for several years; he shows albuminuric retinitis; his urine is passed in large quantity, but of low specific gravity, and containing albumen.

What is the matter here? He has the fatty kidney of chronic tubal nephritis, with commencing fatty degeneration. But these cases I will consider in my next lecture, when I will make some observations upon the different forms of disease commonly included under the specific title of Bright's disease of the kidneys.

Periscope.

Action of Remedies on the Liver.

Dr. William Rutherford, of the University of Edinburgh, assisted by M. Vignal and Dr. William J. Dodds, has for some time past been examining, by scientific methods, the effects produced on the liver and the biliary secretion of the dog by a long series of drugs. The investigation has been assisted by a grant from the British Medical Association, and a lengthy and interesting report has been published in recent numbers of the British *Medical Journal*. The following short account is founded on the summary of results published in No. 945. The authors state carefully that "all the conclusions are based on experiments performed on the dog, and have no reference to any observations made on the human subject." But in the few cases in which the results thus obtained have been relied on in suggesting experiments on men, the results seem to be trustworthy, and much light is thrown on the comparative action of remedies. It is impossible to avoid much disagreeable repetition in reports of this kind, but attempts have been made, by classification, to reduce this as much as possible.

Calomel stimulates the intestinal glands, but not the liver. Mercuric chloride is a powerful hepatic stimulant, and has only a feeble action on the intestinal secretion. When administered together the liver and intestinal glands are both excited.

Castor oil does not stimulate the liver, and croton oil does so but slightly. Both excite the intestinal glands.

Jalap is a powerful hepatic and intestinal stimulant; scammony very feebly excites the liver; gamboge stimulates the intestinal glands only.

Colocynth and ipecacuanha both largely increase the secretion of bile. Ipecacuanha slightly augments the secretion of intestinal mucus, while colocynth powerfully excites the intestinal glands.

Taraxacum and senna are both feeble hepatic stimulants. Rhubarb increases the secretion of bile—certainly, though not largely; aloes is a powerful stimulant of the liver.

Podophyllin is "a very powerful stimulant of

the liver," the bile secreted under its action retaining its normal percentage of solids. If the dose be too large, the secretion of bile is not increased. It is also a powerful intestinal irritant. Euonymin, sanguinarin, and iridin are all powerful hepatic stimulants, and they also increase the intestinal secretion, but not so violently as podophyllin. Leptandrin, baptisin, phytolaccin, hydrastin, and juglandin have similar but milder effects. Menispermin slightly stimulates the intestinal glands, but not the liver.

Magnesium sulphate and manganese sulphate stimulate the intestines, but not the liver; sodium sulphate has a considerable effect on the liver, and a lesser one on the intestinal glands; potassium sulphate is a hepatic and intestinal stimulant of considerable power, though its effect on the liver is uncertain, owing, probably, to its sparing solubility.

Sodium phosphate is a powerful hepatic and moderately powerful intestinal stimulant; ammonium phosphate is a moderately powerful stimulant of the liver, but does not excite the intestinal glands; Rochelle salt is a feeble hepatic, but a powerful intestinal stimulant.

Dilute nitro-hydrochloric acid is a hepatic stimulant of considerable power; sodium chloride is a feeble stimulant of the liver; ammonium chloride excites the intestinal glands, but not the liver. Potassium iodide has no notable effect on the biliary secretion.

Calabar bean, in moderate doses, stimulates the liver; atropine sulphate antagonizes its effect, but when given alone does not actually affect the secretion of bile. Morphia does not appreciably affect the hepatic secretion, and does not interfere with the stimulation produced by such a substance as sodium salicylate. Hyoscyamus resembles morphia in these respects. Pure, diluted alcohol does not affect the biliary secretion, and jaborandi is a very feeble hepatic stimulant.

Lead acetate, in large doses, diminishes the secretion of bile, probably by direct action on the liver. Tannic acid does not affect the biliary secretion.

On the Suture of Nerves.

A Russian surgeon, Dr. Bakowiecki, states, in a monograph quoted in the London *Medical Record*, that the suture of nerves considerably hastens their cicatrization, and the re-establishment of their functions; that it is necessary to unite the cut nerves within twenty-four hours of their section, and to perform the operation in such a way as to prevent the ligature from passing through any structure except the neurilemma; and that sutures of catgut must be alone employed, as they do not cause suppuration, while they are wholly absorbed in the wound. Suture prevents the appearance of tetanus. Eulenberg and Landois obtained negative results because they passed the ligature through the whole thickness of the nerve. The experiments of Dr. Bakowiecki were made upon various animals; they were one hundred in number; the nerves sewn were the sciatic, vagus, and hypoglossal. The sutures employed were of silk, silver, and catgut prepared by Lister's method. The microscopical appearances seen were in the negative cases, in which no regeneration of the nerves took place, destruction of the axis cylinders. In the positive cases, in which there was regeneration of the nerve fibres, a bud made its appearance at the end of the axis cylinder of the nerve. After a lapse of thirty days filaments (axis cylinders) were seen, which appeared to consist of fusiform cells communicating with each other by their prolongations. Around the filaments a pale contour line could be distinguished; this line the author believes to be the medullary sheath. The filaments themselves join directly the original nerve fibres of the central end of the cut nerve. The author supposes that new nerves are thus formed, and he bases his supposition upon three facts. In the first place, the filaments just described pass directly into the nervous fibres. Secondly, the portion of regenerated nerve is composed of these fibres. The nerve, when so formed, is found to have recovered its functional properties. Lastly, the filaments are strongly stained by carmine, and they act in the presence of certain chemical reagents in exactly the same way as do the true axis cylinders. The pale contour line is supposed to be the medullary substance of the nerve, and not the neurilemma or sheath of Schwann, because no nuclei have been found in it.

Peculiarities of the Third Stage in Placenta Prævia Labors.

Professor A. R. Simpson says, in the Edinburgh *Medical Journal*, I may be allowed, in passing, to make some observations on the peculiarities in the third stage of labors complicated with placenta prævia. These observations hold good to placenta prævia cases general, as well as to primiparal placenta prævia cases, although I am led to make them from the circumstance that in both our cases it was found necessary to extract the placenta artificially.

1. *Common Necessity for Shortening the Third Stage.*—To begin with, we can rarely afford to allow any lengthened interval to elapse in such cases between the birth of the child and the complete evacuation of the uterus. The loss of blood which the patient has sustained during the first stage of the labor may have proceeded just so far that she could survive it, but a slight additional drain would prove fatal. Unless the uterus be contracting with even more than usual vigor, it is likely that there will take place additional loss of blood, owing to the partial detachment of the placenta that has been produced. In ordinary cases, where the patient has lost no blood previously, and where the placenta lies high and perhaps either unseparated or else completely separated in the uterine cavity, we may wait for half an hour or more, without seeing any hemorrhage to call for interference. But where the patient is already largely drained, and some degree of hemorrhage is necessarily progressing, as takes place so commonly in placenta prævia cases, the indication for artificial shortening of the third stage becomes very urgent.

2. *Inertia of the Uterus.*—Again, even if delay were safe, it would, in these cases, require to be unusually prolonged. For, *first*, the placenta, or what remains of it still adherent to the uterine walls, is attached low down in the cavity, where

the muscular walls are thinnest and weakest, and where but a limited set of the muscular bundles can come to bear on it for its detachment and extrusion. And, *secondly*, the rapid withdrawal from the uterus of the main mass of its contents leaves it with a tendency to inertia, which can only be overcome by active pressure and the use of ergot. The muscular conditions of the uterus thus form a second indication for interference in the third stage.

3. *Adhesion of the Placenta.*—There is another difficulty, which we may be prepared to meet in such cases. The placenta is so firmly adherent to the uterine walls, in consequence of inflammatory changes in the maternal portions of it, that its separation requires extreme care and causes some difficulty. It is just such an adhesion as may require similar interference after an otherwise normal labor. Only, here the inflammatory changes in the uterus, to which in this case the prævial complication is due, assert their mischievous influence further by leading to this firm adhesion between the uterus and the badly-placed placenta. Such a double evil result is easily intelligible.

Dilatation of the Os for Sterility.

Can the dilatation of the contracted os uteri by sponge-tent facilitate impregnation? is the subject of an inquiry by Dr. Haussman, in the *Archiv für Geburtshulfe*. After a short historical *résumé* of the introduction of sponge-tents into gynæcological practice in general, and for the cure of sterility in particular, the author explains the injurious changes in the cervical mucous membrane, and in the character of the secretions from it, which the sponge-tent, and, even though in a lesser degree, the tangle-tent, effects, and formulates his results in the following propositions:—When I summarize, therefore, my observations, the attempt to facilitate impregnation by dilatation with sponge-tents, in cases of contraction of the os uteri or of the cervix, is found unavailing. 1. On account of the increase of the traumatism associated with the coitus, which is exerted upon the uterus; or, 2. On account of the peeling off of the epithelium of the mucous membrane, which, at all events, is not without importance for the movement of the spermatozoa; or, 3. On account of the alterations in secretion from the mucous membrane, which is destructive of the movement of the spermatozoa; or, lastly, on account of the equally destructive action of the carbolic acid, or other similarly acting solution, employed for purposes of disinfection. In consequence of these experiments, the conviction has long since forced itself upon me, that if we do not succeed in retaining the dilatation obtained by the sponge-tent patent, until the injurious influence of the traumatism conditioned by it has disappeared, and until, furthermore, the mucous membrane of the uterus, with its secretion, has returned to the normal state, which, possibly, in each of the above-mentioned favorable cases, occurred, or unless other dilating cones be discovered free from these defects, there at present exists no prospect of turning this method of artificial dilatation of the os uteri or its neck to account in facilitating a conception.

Cases of Dyspareunia.

In the *American Practitioner*, Dr. A. F. Kinne gives several cases of this difficulty, two of the most striking of which we quote:—

In the winter of 1872 Mr. C. came to my office for advice in behalf of his second wife, whom he had recently married and with whom he had found it impossible to have sexual relations. Upon a careful examination of this case, under chloroform, no cause for the dyspareunia could be discovered. It seemed to be purely a neurosis; and relief was obtained by inserting the thumbs, back to back, and making forcible dilatation. I might have tried iodoform, or some other local application, in this case, but chloroform being necessary for a thorough physical examination of the case, the course which I took was probably the best.

The experience of this gentleman in his marital relations would seem to have been exceptionally trying. He stated that he had lived nine years with a former wife, without ever having accomplished the sexual act. And it would seem that a sensitive caruncle must have existed in the case of this wife, for at times she complained of great pain in urination and so forth. But the most remarkable point in this case was, that he had consulted a number of physicians, at different times during this long period, without obtaining any relief or satisfaction—a state of things which will be found to exist, I think, in connection with a very great proportion of these cases. Indeed, but for this circumstance I should hardly deem my own experience worth reporting. Vaginismus and dyspareunia are comparatively recent terms, and the time is within the memory of many of us when nothing used to be said about the condition which they describe.

Milk Feeding to Infants.

Professor Dill, at a late meeting of the Ulster Medical Society (reported in the Dublin *Medical Journal*), states that some members of the profession had taken in hand to weigh a child before and after taking the breast milk, and found that from three to four ounces were taken at a time, amounting in all to about two pounds a day. Another important matter to be attended to is the temperature of the milk; it should have a mean temperature of 95° Fahrenheit. He considered this point quite as important as either quantity or quality, and thought that much injury arose from want of attention to it. He thought that if we could get over our prejudices, ass's milk would probably be the best, as it comes nearer the mother's, but as society is constituted, we need not go beyond the cow's milk; but with all the care and attention which can be bestowed, it is a poor substitute for the soothing influence of a mother's lap and a mother's bosom; and no man of any experience could recommend bottle-feeding as compared with the breast. In consulting physiological chemists we find that the mother's milk varies much from first to last, becoming stronger as the child grows older, and is adapted to the child's strength up to that period when the child should be weaned. We should take a leaf from nature's book, and diminish dilution as the child advances. He would not dilute with barley water, as some advocated, but use simply pure

water. Cow's milk requires a little alkali—depending on the state of the bowels; if loose, chalk or lime water; if constipated, a little magnesia.

Rules for the Prevention of Self Abuse.

Mr. J. Burns, of London, has recently written a well-intentioned pamphlet, entitled "The Science of Life." The evil sought to be remedied is the habit of masturbation among the young. The remedy suggested is, that parents should enlighten the minds of their sons as to the true uses of their reproductive organs, and the evils resulting from self abuse. It is a difficult subject, but, says a reviewer in the Edinburgh *Medical Journal*, we can conceive no possible harm resulting to boys from a little *wholesome* knowledge on these matters, when they are certain, too soon, to get plenty of *unwholesome* knowledge of a similar kind from their school companions. The following rules are given as aids to the abandonment of bad habits, and to the stoppage of involuntary emissions:—

1. "Perfect cleanliness of the genital organs; if possible, a cold bath every morning." With reference to this rule, we are of opinion that circumcision would aid in lessening masturbation by ensuring cleanliness.
2. "Abundant, but not exhausting, exercise of the arms and shoulders, quite as much as of the lower limbs, since if these latter are exclusively exercised too much blood is directed to the generative organs.
3. "Strict moderation in eating and drinking; avoidance, as far as possible, of late suppers, rich, greasy, or highly-seasoned dishes, and of meat and eggs, except in small quantities.
4. "Abstinence from tea, coffee, and alcohol in every form."

Reviews and Book Notices.

NOTES ON CURRENT MEDICAL LITERATURE.

——"The Treatment of Ringworm in Public Institutions," is the title of a paper by Dr. J. V. Shoemaker, of this city, reprinted from the *Transactions* of the American Medical Association. The author especially recommends the treatment by puncture with the needle-knife.

——The Mahoning County, Ohio, Medical Association has commenced the publication, in pamphlet form, of its *Transactions*. The first number contains fourteen small pages. It would have been better, we should think, to send a carefully written copy of the Transactions, properly condensed, to some established medical journal for publication.

——The theory of maternal impressions, or mother's marks, is attacked by Dr. Roswell Park, of Chicago, in a reprint from the *Southern Clinic*. He writes: "I contend that while we are hardly prepared to deny explicitly and *in toto* that a mother's mental condition, be it temporary or more or less permanent, may in some obscure and inexplicable way modify the normal development of the fœtus in utero, still we are certainly not yet in a position, either, in the first place, to even admit that such an influence can make itself felt; or, secondly, and supposing this possible, to pretend in this way to explain the palpable abnormality.

BOOK NOTICES.

Chemistry; General, Medical and Pharmaceutical. Including the Chemistry of the U. S. Pharmacopeia. By John Attfield, M.D., etc. Eighth edition. Revised by the author. Phila., H. C. Lea, 1879. 8vo, pp. 697.

The popularity which this book has enjoyed is owing to the original and clear disposition of the facts of the science, the accuracy of the details, and the omission of much which freights many treatises heavily without bringing corresponding instruction to the reader. Dr. Attfield writes for students, and primarily for medical students; he always has an eye to the Pharmacopœia and its official preparations; and he is constantly putting the matter in the text so that it responds to the questions with which each section is provided. Thus the student learns easily, and can always refresh and test his knowledge.

So much for the plan of the work; of the matter and substance we need not speak. The author has subjected it to a careful revision, and adds the novelties in chemistry which the last few years have brought forth. The modern notation and terminology are introduced and explained; and illustrations are added in sufficient numbers to elucidate the manipulations. Numerous tables and a long index complete the volume; but as nothing is perfect, so this index is not; we turned to it to find out something about carbonic oxide, but the two references given are quite blind and unsatisfying.

Fasting Girls, their Physiology and Pathology. By William A. Hammond, M.D., etc. New York, G. P. Putnam's Sons, 1879. 8vo. pp. 76.

A timely, pointed and powerful protest is here entered by the eminent neurologist against one of the absurd popular superstitions of the day. The work was suggested by the Mollie Fancher case, the fasting girl of Brooklyn, who induced even cautious medical men to sustain her claim of prolonged and impossible abstinence from food. All who want enlightenment on this subject will do well to peruse this clear refutation of such deceptions.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	**$5.00**
Half-Yearly Compendium of Med. Science,	**2.50**
Reporter and Compendium, - - -	**7.00**
Physician's Daily Pocket Record, - -	**1.50**
Reporter and Pocket Record, - - -	**6.25**
Reporter, Comp. and Pocket Record, - -	**8.25**

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

D. G. BRINTON, M.D.,
115 South Seventh Street,
PHILADELPHIA, PA.

QUARANTINE AND THE PLAGUE.

In view of the possible approach of the plague, the question of quarantine comes to the front as one of prime importance. An influential and able class of sanitary writers have thrown the weight of their names against restrictive quarantine. Of these, we mention Dr. AUGUST HIRSCH, in Germany, Mr. NETTEN RADCLIFFE, in England, and Dr. HENRY HARTSHORNE, in this country, as typical examples. All these writers have exerted themselves to point out the futility, as shown by experience, of the traditional measures of quarantine for the arrest and repression of plague, and urged that the attention of Governments should be concentrated on the strengthening and extension of such measures of internal local sanitary administration as had proved most efficacious in the control of infectious maladies. On their side they have such eminent backers as PETTENKOFER, SIR WILLIAM JENNER, and a host of distinguished names. All these declare quarantine, sanitary cordons, blockading suspected places, and confining and isolating suspected persons and places, as folly and needless cruelty.

We are not disposed to underrate the weight which should be allowed to such opinions; nor can the neglect of the best sanitary measures be excused or passed over by the establishment of cordons; nor should the needless cruelties of the old quarantine regulation be repeated; but for all that a restriction of intercourse between the sick and the well, and a segregation of cases, are wise measures and should be observed.

Let it be remembered that it was against this very disease, the plague, that European governments first devised the system of quarantine. It was not against cholera or yellow fever, but against this far more terrible scourge, that this onerous and unscientific system was devised. For a century and a half it has not visited western Europe; and when it last did so, it seems to have been restricted and kept within narrow limits by a sanitary cordon of unsurpassed rigidity (Marseilles, 1722).

The law of distribution of the plague seems different from that of cholera. It seems contagious, in the strict sense of the word; and its mortality is far in excess of that of cholera. HECKER calculates that in the Fourteenth century Europe lost by the black death, as the plague was then called, no less than 25,000,000 of its inhabitants. This may have been an exaggerated estimate, but judging from the more reliable records of recent times, he was probably not far wrong. During that same period the mortality in Florence was 60,000, and in Venice, 100,000; while Marseilles lost in one month 16,000 of her inhabitants. During the great plague of London in 1664, 68,596 of the population were carried off, as many as 8000 dying in one September week.

No wonder, therefore, that the panic in Russia has been almost incredible. Persons belonging to every class and station in life have petioned for an entire cessation of all intercourse, even of postal communication, between the rest of Russia and the Volga. Letters which were sent from Astrachan and Zaritzin were not received by the persons to whom they were ad-

dressed. Some people even refused to take paper money, fearing that the germ of the infection might be communicated to them through it. In short, it is almost impossible to describe the terror which took possession of the people, who looked upon this disaster as a punishment from God.

The Governments of Germany and Austria took early measures to restrict intercourse; and their action was prudent; undoubtedly, even if such measures do not check the pestilence, they will stay for a time its course, and allow the completion of sanitary precautions. Should the epidemic advance to Western Europe, we hope our Government will not be led by theorists to neglect enlightened but firm and restrictive quarantine regulations.

The success which seems to have attended the establishment of the sanitary cordon around Wetlyanka is reassuring, and apparently vindicates the expediency of such measures. But sinister reports are published in the German and English papers, that there are other foci of infection in European Turkey which have been sedulously concealed by the authorities, and others again are suspected, which are denied by the sufferers, for fear of a similar fate to that of the Astrachan villages. If these rumors are true, we need not be surprised to hear any day that the pest is slowly creeping westward, and may devastate some of the large cities of Europe, as it did Moscow and Marseilles in the last century.

Notes and Comments.

Therapeutical Notes.

QUININE LOCALLY IN PANNUS.

In an Italian ophthalmological journal, M. Ruvioli records two observations of severe pannus consequent on granular conjunctivitis, which were cured by this means when the habitual remedies had been tried without effect. However, bisulphate of quinine would be of no use when the pannus was accompanied by erethism of the ciliary nerves, or when it is of strumous origin.

CURE OF CORNS.

The method recommended by M. Guibout is to soften the corn by applying to it, for one night, an ointment consisting of turpentine and acetate of copper, each one part; white resin two parts, and yellow wax four parts. The corn should then be excised with scissors, care being taken to go deep enough to remove its summit. After excision the matrix should be cauterized with sulphuric acid, else the corn will be reproduced.

NEW REMEDY IN DYSENTERY.

The latest remedy in dysentery is an East India plant, the *Ixora Dandxuca*. The drug is very efficacious in dysentery, most so, as in the case with ipecacuanha, when the cases treated by it are seen early. It possesses the advantage of not creating nausea, while it has an aromatic and agreeable taste. It has also been given in fifteen to thirty grain doses three or four times a day, and may be administered with confidence to patients of all ages.

SALICYLATE OF SODA IN CHOREA.

In a case of chorea, in a child of seven, Dr. S. Weir Mitchell gave the following prescription for more than a month, and apparently with decided advantage, each dose containing—

℞.	Sodii salicylat.,	gr.x	.67 Gm.
	Glycerinæ,	ʒj	4
	Spts. lavendulæ,	♏v	.33
	Ol. gaultheriæ,	gtt.½	.01
	Aquæ, q.s. ad.	ʒ ss q.s. ad. 16	

Given three times a day.

He has been experimenting in this case and in a number of others, concerning the effects of salicylate of soda in chorea, and it looks as if the experiment would prove to be of some value.

CHAPPED HANDS.

A useful mixture, used by Dr. M. A. Wilson, of New York, is—

℞.	Acidi carbolici,	gr.xv
	Vitellum ovi,	No.j
	Glycerinæ	f.ʒ iij.

Smear a small portion on the hands several times daily.

Milk Diet in Dysentery.

At the conclusion of an article on the more severe forms of dysentery, in the *Archiv für Heilkunde*, March, 1879, Dr. Wernich strongly recommends an absolute milk diet, continued well into convalescence, as by far the best plan of nourishment. At first some lime water may be added to the milk. This diet, with opium and belladonna, especially in suppository, to reduce the tenesmus, the avoidance of astringents, and occasionally the use of ipecac, are all that is required.

Consciousness as a Mental Factor.

In an article in the *Nineteenth Century*, Mr. Francis Galton says:—

"The more I have examined the workings of my own mind, the less respect I feel for the part played by consciousness. I begin, with others, to doubt its use altogether as a helpful supervisor, and to think that my best brain work is wholly independent of it. . . . Its position appears to be that of a helpless spectator of but a minute fraction of a huge amount of automatic brain work."

A peculiar condition of the mind in relation to consciousness, is that exhibited by somnambulists. Dr. W. Munro remarks on this, in the Edinburgh *Medical Journal*—

"As many people are once or twice in their lives somnambulists, and no bad after affects are ever observed in them, it can hardly be said that somnambulism is always the effect of brain disease. There only appears to be some peculiar temporary vaso-motor disturbance, causing, as Anstie has pointed out there is, deeper unconsciousness than in ordinary sleep, while the power of coördinating movements remains. But that all responsibility for such acts as are done in such state is abrogated, must be at once admitted, when the astuteness with which somnambulists will succeed in overcoming precautions for their own safety, taken by others with their own waking consent (Anstie), is considered."

Comparative Anatomy of the Olfactory Apparatus.

In connection with the editorial on the Sense of Smell, in the REPORTER, p. 302, we quote the following from a paper read before the Royal Society, by Dr. A. M. Marshall, recently:—

He declares that "The olfactory organ is a visceral cleft; the olfactory nerve is the segmental nerve supplying the cleft in a manner precisely similar to that in which the hinder clefts are supplied by their respective nerves; and that the Schneiderian folds are gills." These conclusions are adequately supported by explanatory details of observations conducted on a long series of vertebrate embryos, and we may reasonably accept the proposition that "as there are no nerves or clefts in front of the olfactory segment, the olfactory nerve must be taken as the most anterior nerve, and the nose as the most anterior (visceral) cleft." The study of homologies is in itself so fascinating, and being so, calculated to lead the observer to formulate extravagant hypotheses, founded on his observations, that there is, rightly, a certain unwillingness to accept new explanations always apparent. But these results of Dr. Marshall's work derive such material support from the carefully arranged anatomical and developmental details, that they may be safely accepted as the rational explanation of that they seek to make clear. The paper is an important contribution to anatomical literature.

Is Insanity Increasing?

This is the title of a paper by Dr. Mortimer Granville, in the *Nineteenth Century*. He answers the question in the negative. It is true that the number of insane persons in each succeeding decade is greater. This is partly due to an actual increase in the population, but it is chiefly owing to the circumstance that the admissions of insane persons into asylums are more numerous than the discharges by death or recovery. The outlet being less than the inlet, there is progressive accumulation. Another minor though not unimportant cause of the alleged increase of insanity is said to be the crowding of asylums with imbecile paupers and troublesome old people, of both sexes and all grades.

Syphilis d'Emblée.

This is the name applied by French syphilographers to those cases of general secondary syphilis which have not been preceded by any primary sore—absorption without local infection. Dr. Weinberg, of Vienna, in a paper before the Doctoren-Collegium of that city, recently cited two cases, but concluded with the assertion that all such instances are deceptive, and that the absence of the primary sore is only apparent. In all cases he maintains there is and must be one, although, especially in women, the patient may be ignorant of its existence. Direct absorption of the virus, without cutaneous lesion, he rejects.

Action of Beverages Charged with Carbonic Acid Gas.

These beverages are so popular, that the following observations, given by Dr. Quincke, in the *Archiv für Pathol. und Pharm.*, are interesting:—

Beverages charged with carbonic acid gas are diuretic.

Their diuretic effect is owing to a superabundance of water in the blood, due to the more rapid absorption of these beverages.

They have little effect on the blood pressure and pulse, but by reflex action the respiration becomes slower and deeper.

Studies on the Physiology of Conception.

Some interesting observations on this subject were communicated last year to the Berlin Medical Society, by Dr. L. Löwe. He has discovered that a single spermatozoon is sufficient to impregnate an ovum; indeed, that in nearly every case only one gains admittance, and that as soon as this one penetrates the walls, an immediate deposit, something in the nature of a chemical precipitate, takes place on the walls of the ovum, which prevents any further access of spermatozoa. Occasionally, however, two spermatozoa do gain admittance, either owing to their penetration being simultaneous or the animal being in ill health. When this is the case, the result is a double monster, or a malformation of some kind. The transparent eggs of certain fish are best suited to exhibit these processes.

A New, Tasteless Purgative.

Le Progres Médical states that Dr. Rabuteau has recently made some researches in regard to the physiological action of a new saline purgative, sodium sulpho-methylate, or methyl-sulphate. This is a colorless salt, crystallizing with difficulty, but destitute of any disagreeable flavor. M. Rabuteau first injected ten grammes, or about two and a half drachms, of the salt, dissolved in ten times its weight of water, into the veins of a dog, and found that no diarrhœa was produced. Subsequently he administered fifteen grammes, about half an ounce, of this salt, dissolved in two wineglassfuls of water, to a patient under the charge of M. Quinquaud, in the Hôtel Dieu. The effect was that it caused free evacuation of the bowels.

Hypodermic Medication.

The hypodermic syringe, to him who knows how to use it, is an invaluable companion. It is indifferent whether the patient can swallow or not; the agents are the simplest; a sufficient medicine chest can be carried in the vest pocket; there is no nauseous dosing, and the effects are prompt and certain. Would we relieve pain, we inject morphia; would we produce vomiting, apomorphia or emetina; would we lessen fever, quinia; would we excite the cutaneous and salivary secretions, pilocarpin; would we check hemorrhage, ergotin; would we evacuate the bowels, aloin; would we check night sweats, atropia; would we relieve paralysis, strychnine; would we cure syphilis, mercurials, etc. Surely the advantages of this method are immense.

Dangers of Chlorate of Potash.

This remedy, so extensively used by the public as a domestic medicine, is a poison, and should be labeled as such. In the *Med. Central Zeitung*, Feb. 5, Dr. Schultze relates a case of a three-and-a-half-year-old boy, who had a slight diphtheritic attack. The parents gave him freely of a saturated solution of the chlorate for a gargle; as was natural, the child swallowed most of it. The amount thus used was one ounce in six days. Nausea, vomiting, diarrhœa, cyanosis, and sleepiness advancing to coma, supervened, and the child died. Evidently these symptoms arose from the drug. Various similar cases have been reported, and they should serve as warnings against the careless use of a potent drug.

Epidemic Influenza.

Dr. Edgar Bolles, of Pennington Point, Ill., writes: We have had an epidemic of influenza that has been quite troublesome, affecting the old and young of McDonough and adjoining counties. Also quite a wave of pneumonia has passed over the same region, mostly of the catarrhal variety, and more than commonly fatal.

Correspondence.

Veratrum Viride.

Ed. Med. and Surg. Reporter:—

In giving veratrum, it has been my habit to begin with three drops Norwood's tincture, and repeat in four hours, increasing by one drop every third dose, until the pulse was softened and brought down to seventy or seventy-five beats per minute.

I have never yet met with a case in which it was necessary to exceed eight drops to attain the desired end. And in such cases the specific effect of the drug, nausea and vomiting, with great prostration, was a most disagreeable, if not dangerous, complication. In my own case, and I think I have quite a degree of toleration, seven drops, repeated in four hours, will quickly reduce the pulse from one hundred to sixty beats per minute.

I now recall a case in which about twenty drops were given by mistake, followed by most severe vomiting and alarming prostration. When these larger doses are found necessary, I often notice a rapid falling of the pulse from one hundred or over to fifty-five or fifty, the patient, at the same time, complaining greatly of a distressed or "gone" sensation.

A patient of mine, only a few weeks since, was violently vomited and greatly prostrated by taking six drops of the tincture, when it had been gradually increased to that quantity from four drops. The testimony the doctor has brought forward would certainly seem sufficient to satisfy the most skeptical that these heroic

doses may be, and are, given without destruction to life. But is it the soundest practice, in ordinary cases, where life is not in imminent peril, to use these most potent remedies in such doses as must, in nearly every instance, threaten the safety of the patient, and in some produce fatal consequences—in *which* we cannot know till we have tried—merely to abort or cut short a disease, while their power to do so is still a matter of grave doubt? As in a most alarming case of croup or diphtheria the physician should not hesitate to perform tracheotomy, so should he not doubt the propriety of employing *ten* drops of the tincture of veratrum viride in puerperal fever which has resisted more conservative doses. The one, at the outset, would, I think, be as unwarrantable as the other. In either case he adopts the safest alternative. My experience with this remedy has not been among the enfeebled poor of our large cities, nor the enervated votaries of fashion and luxury, but largely in the country, and among those who earn their bread by the sweat of their brow. Not among the asthenic, but the sthenic.

I think it should be a matter of careful study and experiment with us, as physicians, to ascertain, as nearly as may be, the smallest possible dose of a given remedy that will be required to meet the indications in a given case. Of the three conditions, no medicine, too little medicine, or too much medicine, if I were the sick man, I would accept the first. Either would quite likely not give the patient his best chance, and this would diminish from first to third. I find that I cannot, with safety to my patients, use very many medicines in doses as laid down in books and medical journals; whether due to idiosyncrasy, climate, or type of disease, I cannot say. I do not have cases that will tolerate for weeks and months thirty, forty or fifty grains potass. iod. three times a day, nor do I often find use for more than ten or fifteen grains of chloral hydrate at one dose, when that remedy is indicated. This list might be extended almost indefinitely, but let mention of these two suffice. In my criticism of this prescription I can assure the Doctor that it is most kindly meant, and is by no means intended to give encouragement to that class of physicians whose "stock in trade" consists largely in attempts to build themselves up by casting slurs upon the practice or character of brother practitioners.

I simply state here what has been my experience with this drug, and if it does not harmonize with that of some other physicians, well. We shall have no battle about it, but by comparing notes will be able to prescribe with greater definiteness, and contribute our mite toward placing medicine among the more exact sciences.

Youngstown, N. Y. F. J. Baker, M.D.

Ed. Med. and Surg. Reporter:—

I wish to give Dr. Fowler my experience with Norwood's veratrum viride. Dr. Kemper, of Va., gave to a young, delicate lady, aged 16, eight drops of the veratrum every four hours, in syrup of squills. The third day of her disease, pneumonia, he was unable to visit the patient, and I was called, and prescribed the veratrum in the same dose and at the same interval. I also ordered the nurse to continue Dr. K.'s treatment, not knowing the syrup of squills contained veratrum, and thought he was giving it only as an expectorant. The nurse continued to give the double dose until the patient had taken fifteen doses, making a total of 336 drops in 108 hours, or 27 doses in all. When Dr. K. and myself saw the patient together, we found the double dose had brought down the pulse from 136 to 55, and our patient made a rapid recovery. I often prescribe the veratrum, and I have always found it to be the only remedy we can rely on to control the muscular power of the heart with any certainty. An over dose will produce nausea and vomiting, so that we are compelled to use some pleasant adjunct, especially when there is gastric disturbance.

Elgin, Texas. G. K. Young, M.D.

Flexible Metallic Bougie.

Ed. Med. and Surg. Reporter:—

This instrument is made of small silver wire, coiled exactly like the flexible arm of a dental engine, with a solid silver tip where the wires are secured. I have found this to be the best instrument for the purpose of passing through strictures that I have ever used. It has all the good qualities of the French gum catheter and bougie, with the additional advantage of being more firm and holding all the ground as fast as gained, or in other words, it stays in the urethra just where it is left, and is not forced out by the spasmodic action of the muscles of the penis. It is just as flexible as a gum catheter, and will follow the most tortuous canal with much greater ease. In introducing it, the operator should give it a twisting motion with his fingers, the same as in the introduction of the French gum elastic catheter, than which it is much easier to introduce, because of the screw arrangement of the silver wires composing it. Besides its use as a bougie, I have found it quite convenient for attaching the galvanic apparatus described in the Reporter, vol. xxxix, p. 175; it makes a much stronger electrode than a catheter, because each wire in its composition carries a separate current. Any surgical instrument maker can manufacture it.

Greenville, Mich. O. E. Herrick, M.D.

Small Doses—Action of Quinine, etc.

Ed. Med. and Surg. Reporter:—

The publication of my paper on small doses, which appeared in your issue of September 7th, 1878, has elicited many evidences of approval on the part of the profession. I received a few days ago the subjoined letter from my friend, Dr. Ward, of Baltimore county, a member of the Maryland State Board of Health, and a most popular practitioner of medicine for a period of fifty years:—

Dear Doctor:—I have read, in the *Scientific American*, with much pleasure, your article on the effects of medicine in small doses. I was gratified to learn that I was not the only old fogy left. My experience confirms your views. The tongue indicating an abnormal state of the secretions, I have found calomel the agent to be relied on. When using the lancet freely, I then

gave a large dose of calomel, for its depressing power. I am persuaded that many lives would be saved if the system were influenced by it to a gentle tenderness of the gums.

The action of quinine is certainly not well understood. Will not, or may not, a large dose of quinine change or modify the abnormal action of the nerve centres, and small and repeated doses sustain the new action? Does not disease primarily act on the nerve centres, or rather the cause of disease?

I have used tartar emetic for many years in the way you do. I have found it the most useful remedy in mammary inflammation; in what are termed bad colds; also after parturition, with heated skin, restlessness, and a feeling of malaise. In these cases an intestinal irritant might and often has placed the patient in great danger. A solution of tartar emetic, one grain to eight ounces of water, acts beautifully. Dose one tablespoonful every hour. Excuse an old fogy.

J. Robert Ward, M.D.

Dr. Ward's theory in regard to the action of quinine is both novel and suggestive. An interesting paper by Dr. Bramblett, of Newburn, Va., appears in the *Transactions* of 1878, of the Medical Society of Virginia, in which the danger of the administration of large doses of sulphate of quinia and sulphate of cinchonidia is depicted with much force. John Morris, M.D.

Baltimore, Md.

On Purpura or Land Scurvy.

Ed. Med. and Surg. Reporter:—

Last fall I treated a case of what I called "purpura;" age 16; had been having chills; petechiæ all over the body, especially the legs and thighs, from small round puncta the size of a split pea, to purple blotches as large as a silver quarter. Had bad food, bad air, etc.

Case No. 2, of same description in appearance of eruption, but a girl of about 8 years old, with good food, clean surroundings, and no chills; but stiffness of limbs, with little or no pain.

Case No. 3 was treated a year ago last fall. A young man, aged 21, with the best hygienic surroundings. No disease except the purpura, which resembled the others in locality and appearance of eruption; spots more abundant, larger, and less livid, and bled dangerously from the nose, fauces, bladder and bowels, but recovered.

Are these cases to be classed with purpura which occurs in crowded cities, on board ships, where poverty, filth, bad food and bad air conspire to poison the blood and reduce its vitality?

I will ask also what relation do these three cases hold to two others treated in the fall of 1877? where hemorrhage from the bowels came in connection with a chill, the bleeding being so severe as to endanger the lives of both patients. Of the last two cases, also, one was a boy, 14 years old, and in a poor family, and was probably insufficiently fed, as he was not very warmly clad. The other was a young lady with comfortable surroundings. W. H. Rose, M.D.

Thorntown, Ind.

News and Miscellany.

American Medical Association.

The following rates of fare to Atlanta have been obtained thus far:—

Steamer from New York to Savannah, and rail to Atlanta, $19.50. Both ways, $34.00. Including state rooms and meals on ships.

Railroad, *round trip*—

From Louisville,	$23.85
" New York,	37.25
" Philadelphia,	33.75
" Baltimore,	29.75
" Washington,	27.75

As there may be other points secured, at starting it would be well to ask at railroad office for excursion rates.

Apply to undersigned (with stamp) for certificate, by which only can these rates be obtained.

Wm. B. Atkinson,
Permanent Secretary.
1400 *Pine St., Phila.*

Medical Society of the State of Pennsylvania.

The thirtieth annual session will be held in Chester, on Wednesday, Thursday and Friday, May 21, 22 and 23, 1879, commencing on Wednesday, at 3 P.M.

The address in Medicine by Dr. Andrew Fleming, Alleghany.

Address in Obstetrics by Dr. E. Wallace, Philadelphia.

Address in Surgery by Dr. Charles T. Hunter, Philadelphia.

Address in Hygiene by Dr. R. A. Cleemann, Philadelphia.

Address in Mental Disorders by Dr. James A. Reed, Dixmont.

All who desire orders for excursion tickets should address the undersigned, with stamp, stating route, etc. Wm. B. Atkinson,
Permanent Secretary.
1400 *Pine St., Phila.*

The Yellow Fever on the U. S. Steamer "Plymouth."

The Surgeon General of the U. S. Navy has furnished the following facts in regard to the recent outbreak of yellow fever on board the U. S. Steamer "Plymouth." On November 7th last four cases of yellow fever occurred on board the vessel, while lying in the harbor of Santa Cruz; these were removed to hospital on shore and the ship sailed for Norfolk. Three mild cases occurred during the voyage, and the "Plymouth" was ordered to Portsmouth, N. H., thence to Boston. At the latter port everything was removed from the ship, and all parts of the interior freely exposed to a temperature which frequently fell below zero, the exposure continuing for more than a month. During this time the water in the tanks, bilges, and in vessels placed in the storerooms, was frozen. One hundred pounds of sulphur was burned below decks, this fumigation continuing for two days, and the berth decks, holds and storerooms were thoroughly whitewashed. On March 15th the

ship sailed from Boston southward; on the 19th, during a severe gale, the hatches had to be battened down, and the berth deck became very close and damp. On the 23d two men showed decided symptoms of yellow fever, and on the recommendation of the surgeon the vessel was headed northward. The sick men were isolated, and measures adopted for improving the hygienic condition of the vessel and crew. The surgeon reported that he believed the infection to be confined to the hull of the ship, especially to the unsound wood about the berth deck, all the cases but one having occurred within a limited area; and that while the "Plymouth" is in good sanitary condition for service in temperate climates, should she be sent to a tropical station, probably no precautionary measures whatever would avail to prevent an outbreak of yellow fever.

Personal.

—On the evening of April 24th Dr. Wm. F. Norris will read a paper on "Optic Neuritis as a symptom of Intracranial Disease," at the Lecture Room of the College of Physicians, at 8 P.M. The profession is invited to attend.

—A banquet was given to Prof. S. D. Gross, M.D., on Thursday, April 10th, by the Alumni of the Jefferson Medical College. There was a full attendance, and many pleasant addresses added interest to the occasion.

Items.

—It is flashed in golden words, under the Atlantic, from Berlin, that "the surgeons have succeeded in painlessly extracting a grain of powder which had remained in the Emperor William's head since Nobeling's attempt on his life."

—A death certificate was recently shown us which read thus:—

Name of deceased, Wight.
Color, do

Evidently the member of the profession who wrote it had left his dictionary at home.

—We have before noted the remarkable vitality of pensioners. In fact, a Government pension seems to confer immortality. General Shields, the new Senator elect from Missouri, while recently speaking in favor of the veterans of the Mexican war, asserted that the Pension Bureau had reported to Congress "a larger army of Mexican veterans alive to-day, than ever stood on Mexican soil at one time, with arms in their hands."

OBITUARY NOTICES.

Dr. Isaac Hays

Was born in this city, July 5, 1796, and died April 13th, at his residence, aged eighty-three years. Dr. Hays was educated at the University of Pennsylvania, and graduated in the Department of Arts in 1816, and the Department of Medicine in 1820. He was the editor of the *American Journal of Medical Sciences*, published by Henry C. Lea. In 1826 Dr. Hays joined the editorial staff, and in 1827 became sole editor, and so remained until 1869, when his son was associated with him. At the time of his death Dr. Hays was one of the oldest living editors, having been connected with medical literature over fifty years. He was elected a member of the Academy of Natural Sciences of Philadelphia in 1818, and was its president from 1865 to 1869. He was an active member of the American Philosophical Society, and for a number of years a member of its council.

Dr. Hays edited, with numerous additions, "Lawrence on the Eye," and was the author of many monographs on medical and scientific subjects. In 1828 he edited Wilson's "American Ornithology; in 1846 Hablyn's "Dictionary of Medical Terms;" in 1848 Arnot's "Elements of Physics."

Dr. J. C. Riley,

Dean of the National Medical College of the Columbian University, Washington, D. C., died in that city, in February. He was born in 1828, and had given much attention to materia medica and pharmacy. He was the oldest surviving member of the National Association for revising the U. S. Pharmacopœia, in 1880, and is said to have been the only survivor having authority to call the next meeting of that Association.

MARRIAGES.

CHAFFEE-DOW.—In Strafford, Vt., March 18th, by Rev. Henry Cummings, Fred. F. Chaffee, M.D., and Nellie S., daughter of Chester Dow, Esq.

MILLER—BIERY.—At the residence of the bride's parents, in Southwhitehall, Lehigh Co., Pa., April 3d, 1879, by the Rev. E. T. Fogel, Dr. A. N. Miller, of East Texas, Pa., and Miss E. Jane, eldest daughter of Mr. John Biery.

POWELL—LEDBETTER.—On Wednesday, March 26th, 1879, at the residence of Mr. W. S. G. Wilson, at Rockdale, Texas, Dr. E. J. Powell and Miss Ida Ledbetter.

RONEY—DEITER.—On March 3d, by Rev. H. G. Finney, George W. Roney, M.D., of Pottstown., and Ella S. Deiter, of Pottsville, Pa.

DEATHS.

BROWN.—On Thursday afternoon, March 13th, at 2½ o'clock, Selina M., wife of Dr. Thomas M. Brown, formerly of Milford, O., in the 69th year of her age.

GREY.—In Hartford, Vt., Feb. 9th, Dr. Joseph Grey, on his 91st birthday.

HARE.—On March 21st, at St. Thomas West Indies, Horace Binney Hare M.D., of Philadelphia.

HAYS.—In this city, on the 12th inst, Isaac Hays, M.D., aged 83 years.

HODGE.—Suddenly, in Brooklyn, N. Y., on Saturday morning, March 15th, of heart disease, Eliza M., eldest daughter of Dr. James L. and S. P. Hodge.

IVES.—On Friday, the 21st ult., at the residence of Dr. Joseph Parrish, Burlington, N. J., Dr. Charles L. Ives, aged 47 years, late of New Haven Ct.

OSTROM.—At Goshen N. Y., on Monday, March 24th, 1879, Emma Charlotte, wife of Dr. J. W. Ostrom.

PENNELL.—On Sunday evening, March, 16th, Carroll Celsus, only son of Dr. W. W. and M. M. Pennell, aged 10 months, 16 days.

VAN TRIES.—At Pennsylvania Furnace, March 8th, 1879, of acute tubercular meningitis, Eleanor Linn, only child of Dr. Thomas C. and Jennie M. Van Tries, aged 4 years and 6 months.

WOOD.—In New York, on the 21st ult., Dr. Jacob Wood, aged 68 years.

WHOLE No. 1156.] APRIL 26, 1879. [VOL. XL, No. 17.

SYRUP-GLYCEROLE
OF
FERROUS CHLORIDE.

The Combination which all Forms of Iron must assume before Assimilation.

Superior to all other Iron Salts in that, while it is readily taken into the circulation, and does referruginate the blood, it does not ordinarily cause constipation nor headache. It is very pleasant to the taste, and is unalterable.

Ferrous Chloride is a neutral salt, consequently it has no action upon the teeth, and may be administered fearlessly. This fact and the delightful taste of my preparation render it an advantageous form for administration to children. Each fluid drachm contains one grain of Ferrous Chloride, which, owing to the certainty of its assimilation, is a full, active, adult dose.

HINTS IN THE OBSTETRIC PROCEDURE.

BY

WILLIAM B. ATKINSON, A.M., M.D.,

Lecturer on Diseases of Children, at the Jefferson Medical College; Physician to the Department of Obstetrics and Diseases of Women, Howard Hospital, Philad'a.

SECOND EDITION. ENTIRELY RE-WRITTEN AND ENLARGED. 12MO, CLOTH. PRICE, $1.00.

—o—

The very gratifying reception given this handbook of the essentials of the obstetrical art has led the author to submit it to a careful revision, and increase its size by adding a number of new topics.

It may safely be characterized as the most convenient, compact, reliable and handy *vade mecum* on obstetrics in the language; as the following personal and editorial statements sufficiently attest.

OPINIONS OF PHYSICIANS AND THE PRESS.

"It is really a '*multum in parvo*,' and will, I am sure, be of great service to multitudes in the profession who have hitherto followed the routine of old traditions."—*Prof. Fordyce Barker.*

"It is as good for the old as for the young practitioner."—*Dr. J. Marion Sims.*

"It abounds in extremely valuable hints, and is calculated to do much good."—*Prof. Goodell.*

"Founded upon the personal experience of the author, it must prove of value to the very wide circle of the profession who will be led to purchase it by their acquaintance with the author and his reputation."—(Philadelphia) *Medical Times.*

SEASON, AND THE MORTALITY OF EITHER SEX.

BY T. S. SOZINSKEY, M.D., PH.D.,
Of Philadelphia.

From the earliest times the effects of the weather of different parts of the year, or in other words, of the seasons, on the human system, have attracted the attention and serious consideration of thoughtful men. The father of Grecian, not less than the father of English, medicine regarded the subject as one of very great importance. The excellent treatise of Hippocrates on *Airs, Waters and Places* begins with these words: "Whoever wishes to investigate medicine properly should proceed thus: in the first place, to consider the seasons of the year, and what effect each of them produces." It is worth while, also, to recall what Sydenham—whose writings, as well as those of Hippocrates, are still worthy the attention of every scientific physician—says about the matter. "The particular seasons of the year," says he, "which favor particular complaints are carefully to be observed. I am ready to grant that many diseases are good for all seasons; but on the other hand, there is an equal number that, through some mysterious instinct of nature, follow the seasons as truly as plants and birds of passage. I have often wondered that this disposition on the part of several diseases, obvious as it is, has been so little observed; the more so as there is no lack of curious observations upon the planets under which plants grow and beasts propagate. But whatever may be the cause of this supineness, I lay it down as a confirmed rule that the knowledge of the seasons wherein diseases occur is of equal value to the physician in determining their species and in effecting their extirpation, and that both these results are less satisfactory when this observation is neglected." Many physicians of the present day give considerable attention to the subject of the relation of meteorology to health and disease; but it is certain that a great many do not. To not a few it amounts simply to a question of the effects of temperature. In a book just issued under the patronage of one of our leading colleges, which treats of the hygiene of the sick room, not a word is said about the regulation of the humidity of the air! There is ground for the belief that many diseases are now attributed—it being the fashion—to specific *materies morbi*, which really arise directly from conditions of the atmosphere; and there is no valid reason for doubting that extraordinary outbreaks of zymotic and other diseases are mainly due to particularly favorable aerial conditions, or what was called by Hippocrates a pestilential state or constitution of the air. The varying states of temperature, moisture, pressure, wind, electricity, and ozone of, as well as the amount of various extraneous matters in, this composite fluid in which "we live and move and have our being" merit careful study, not only as causes of physiological and of pathological phenomena, but as therapeutic means. A few words about each of these points may not be an inappropriate introduction to what succeeds; for their importance is much greater than many suspect.

Of the temperature of the air, it is well known that either extreme and particularly sudden variations are trying to the system, and fruitful

sources of inflammatory and other diseases. Very old people suffer most from very cold, and very young people from very warm, weather. By way of further generalization, I may quote what Mr. Buchan has to say, as the result of his critical study of mortality, especially in London. Says he (Encyclopædia Brittanica): "The maximum annual mortality from the different diseases groups around certain specific conditions of temperature and moisture combined. Thus *cold and moist weather* is accompanied with a high death rate from rheumatism, heart diseases, diphtheria and measles; *cold weather* with a high death rate from bronchitis, pneumonia, etc.; *cold and dry weather* with a high death rate from brain diseases, whooping cough, and convulsions; *warm and dry weather* with a high death rate from suicide and small-pox; *hot weather* with a high death rate from bowel complaints; and *warm and moist weather* with a high death rate from scarlet fever and typhoid fever."

When the dew-point rises high, or in other words, when the atmosphere becomes heavily loaded with moisture, the system tends to be relaxed, and all functional activity, including that of the brain, lessens in power and intensity. This is especially so when the temperature also is high. In general, I may say that with a temperature of from 65° to 70°, the dew point should be about ten degrees lower, which represents a difference of about six degrees between the two thermometers of the dry and wet bulb hygrometer—or as it may be otherwise expressed, the relative humidity should be about 70. Hippocrates believed that a damp, and at the same time cold, air was the most prejudicial, and a dry, and at the same time warm, air was the most advantageous to health. A very dry atmosphere is beyond all question as bad, if not worse, than a very damp one, not only in its general effects, but in favoring some epidemical diseases. This latter fact did not escape the notice of Bacon, who, in his "Natural History," says: "The general opinion is that years hot and moist are most pestilent, upon the superficial ground that heat and moisture cause putrefaction. In England it is found not true; for many times there have been great plagues in dry years." An incalculable amount of damage to health and strength results from breathing habitually the dry air of houses heated without proper arrangements for supplying a due allowance of moisture. In rooms so heated the dew point is ten or more degrees lower than it should be.

When the pressure of the air is lessening, as shown by the barometer, it is then that sickness, as a whole, is most on the increase and most severely felt. Under lessening pressure there is a decline in the organic activities of the body, and *vice versa*. It is on this principle that the so called compressed air treatment is based. That surgeons should observe and regard, when possible, the state of the barometer in undertaking to perform serious operations, is forcibly impressed by the results of a critical examination by Dr. A. Hewson, of the mortality after amputations in the Pennsylvania Hospital during the thirty years anterior to 1869. It appears that there was a fatality when the "operations were performed with the barometer ascending, of not quite 11 (10.7) per cent; of over 20 (20.6) per cent., with a stationary; and over 28 (28.4) per cent. with it descending." The electric, ozonic and other conditions, as well as the barometric, may have had something to do in producing these results; but still the importance of observing the latter is apparent. The barometer falls simultaneously, as a rule, with an increase of moisture in the air. It has diurnal variations, of which there are two maxima and two minima; one of the former a few hours after sunrise, and the other a few hours after sunset, and one of the latter a few hours before sunrise, and the other a few hours before sunset. These variations become less and less marked in advancing from the equator.

The force and direction of winds are related to the preceding themes, as well as those which follow, and should be carefully studied.

"The air," says Prof. Tyndall, "at all times, can be proved to be a reservoir of electricity which undergoes periodic variations." It is nearly always positive, except within a few feet of the surface of the earth, and its intensity increases with the height. It is scarce in houses and under trees, and in the earth negative. When the sky is cloudless it is always positive, and it is most likely to be found negative in rainy weather. In winter it is stronger than in summer, increasing from June to January, and decreasing from January to June. It varies in amount every day, having two maxima and two minima; one of the former a few hours after sunrise, and the other a few hours after sunset, and one of the latter a few hours before sunrise, and the other a few hours before sunset—just as in the case with the pressure of the air. In the evaporation of impure water—which is accompanied with chemical changes—it is given off, as also from the leaves of trees and plants, and in combustion. It collects upon the surface of the particles of moisture in the air; hence its abun-

dance in the lower stratum of the atmosphere, when dew is falling, and in foggy and cloudy weather. This gives a clue to the explanation of the diurnal and seasonal variations in its amount. Air the electricity of which is negative is depressing and debilitating. An excessive amount of positive electricity has been noticed in the air during the outbreaks of great epidemics. The influence of this agent, which is intimately related to all meteorological changes, is certainly very great. Doubtless, the magnetic condition of the earth, which varies daily, and at different seasons of the year, exercises some influence over the body, both in health and disease.

The peculiar element of the atmosphere called ozone is an active form of oxygen, and when present in considerable amount it is sufficiently stimulating to cause influenza and bronchial affections. In its origin it seems to be related to electricity. It is present in greatest amount when the barometer is falling, the temperature and humidity increasing, and the wind southerly, and *vice versa*. More of it is found in the country than in the city, and little or none of it is to be found in inhabited rooms. It tends to purify the air of organic matter, through its oxygenating power, and in this way has a restrictive influence on contagious and infectious diseases.

I need scarcely say that the varying amounts, at different times, of particles of matter and carbonic acid and other gases in the air produce notable effects on the body, which should be duly studied by physicians.

Besides all these matters, there is another which should not be overlooked in studying the influences of the seasons on the body, and that is light or sunshine, which varies greatly in amount, as well as intensity, throughout the year. The importance of this subject is very great, but I cannot dwell on it here.

Before I proceed to show the mortality of either sex, from all causes combined, at different periods of the year (which is the main object of this article), I may illustrate in a striking manner the relation of season to disease, or rather the death rate, by presenting in contrast the greatest number of deaths in any month and the least in any month of the year from each of a number of the more notable diseases. Taking the United States as a whole, I find, according to the data given in the report of the Census of the year ending June 1st, 1870, that there died from consumption of the lungs, 7837 persons in May and 4716 in June; from pneumonia, 6393 in March and 1356 in July; from cholera infantum, 5188 in August and 478 in December; from diarrhœa, 3139 in August and 418 in February; from typhoid fever, 2767 in September and 1152 in June; from scarlet fever, 2726 in March and 927 in September; from malarial fevers, 2005 in September and 555 in December; from dysentery, 1870 in August and 209 in January; from encephalitis, 1588 in August and 725 in November; from measles, 1359 in March and 248 in November; from enteritis, 1123 in August and 506 in December; from croup, 1248 in January and 473 in July; from diphtheria, 712 in October and 309 in June; from apoplexy, 557 in May and 348 in June; from bronchitis, 500 in March and 175 in September; from erysipelas, 351 in March and 183 in July; from rheumatism, 338 in May and 174 in September; from Bright's disease, 191 in January and 99 in November; from childbirth 489 in May and 255 in November; and of stillbirths there were 948 in May and 611 in November. As the statistics of Philadelphia will show the effects of more distinctively seasonal influences, I will give them for the year 1877. There died in that year, from cholera infantum, 465 persons in July and none in January; from consumption of the lungs, 253 in March and 142 in October; from pneumonia, 152 in March and 24 in August; from diphtheria, 81 in December and 22 in April (and July); from typhoid fever, 74 in September and 24 in April; from scarlet fever, 66 in December and 17 in April; from enteritis (and stomatitis), 62 in July and 14 in January (and February); from croup, 55 in December and 8 in July; from bronchitis, 52 in March and 12 in August; from encephalitis, 49 in May and 20 in January (and February); from Bright's disease, 31 in March and 8 in July; from apoplexy, 24 in January and 10 in June; from dysentery, 19 in July and 1 in November (and February); from measles, 16 in April (and May) and none in November (and December); from erysipelas, 13 in April and 2 in October; from malarial fevers, 7 in September and 1 in February (and March and May); from rheumatism, 6 in June and none in September; from childbirth, 13 in March and 1 in October (and November); and of stillbirths there were 105 in March and 52 in October. In this connection, I may properly advert to the fact that the season of the year in which most deaths from a particular disease occur may not be the one which has had everything to do in generating it. A rather emphatic paragraph from that great observer, Bacon, will make clear my meaning. Says he (op. cit.) many diseases, both epi-

demical and others, break forth at particular times. And the cause is falsely imputed to the constitution of the air at that time when they break forth or reign; whereas it proceedeth, indeed, from a precedent sequence and series of the seasons of the year; and, therefore, Hippocrates in his prognostics doth make good observations of the diseases that ensue upon the nature of the precedent four seasons of the year."

The percentage of the deaths of either sex, from all causes, in the United States, for each month of the year ending June 1st, 1870, calculated from the figures given in the volume on vital statistics of the Census Report, is as follows:—

MONTH.	MALES.	FEMALES.
January	8.34	8.16
February	8.50	8.56
March	10.12	10.08
April	9.02	9.08
May	9.73	10.02
June	6.69	6.77
July	8.45	8.31
August	9.32	9.47
September	8.51	8.55
October	7.46	7.42
November	6.60	6.56
December	7.18	6.96
Unknown	.08	.06

It appears from this table that the months in which there is a greater percentage of the deaths of females than of males are, in order, beginning with the one in which the difference is greatest, May, August, June, February, April (same as in last), September; and the months in which there is a lesser percentage are, in like order, December, January, July, March, October, November (same in last three).

Most deaths of either sex occur in the first quarter of the year; the third quarter stands next, the second next, and the fourth next. In the south of Europe it has long been the popular belief that summer and autumn are the most sickly seasons of the year; but as a matter of fact winter is, in all European countries, the season of the greatest mortality; and it has been shown that the more severe it is the greater is the mortality. Hippocrates says (op. cit.) of the fatality of particular seasons: "The greatest and most dangerous are the two solstices, and especially the summer, and also the two equinoxes, but especially the autumnal." A glance at the above figures shows that this statement does not hold good in the United States; but the greater number of deaths in June than in December is principally due to an excessive infantile mortality in cities. Winter would seem to be the most natural season in which to die, and, in fact, it is then, and not in summer, that the majority of old people die. Thus, in the city of Philadelphia, during the year 1877, there were 639 deaths of persons over 80 years of age, and of these 62 died in January, 51 in February, 85 in March, 68 in April, 49 in May, 64 in June, 42 in July, 38 in August, 47 in September, 37 in October, 35 in November, and 62 in December; or in other words, of the whole number there died during the six months ending June 1st, 376, and during the six months ending December 1st, 263—a difference of 113. I may say that the figures for March, June, September and December are a little larger than they should be, which arises from the fact that for each of these months the deaths of five weeks are reported. An average of the years 1845–1874 gives the order of mortality of the months, for persons over 80 years of age, in London, as follows: December, January, February, March, April, November, May June, October, September, July, August.

Recurring to the monthly death rate of either sex in the nation at large, it will be noticed that the order of the months, according to the mortality in each, is the same for both—a rather remarkable thing: it is as follows: March, May, August, April, February, September, July, January, October, December, June, November. I will give the order for either sex in a northern, a middle and a southern State. For Vermont, the order for males is, October, March, April, August, September, February (with May, January, June, July, and December equal), November; and for females, March, October, May, August, September, April, June, November (with February, July and January equal), December. For Pennsylvania, the order for males is, March, April, May, February, July, August, January, December, June, October, November; and for females, March, May, April, February, July, January, August, December, September, June, October, November. For Georgia the order for males is, May, March, April, January, August, February, July, September, December, June, November, October; and for females, May, April, March, July, August, February, January, June, October, December, November.

I will now give the percentage of the deaths, exclusive of still births, of either sex, in Philadelphia, for each month of the year 1877; carefully calculated from the figures in the Health Officer's Report, it is as follows:—

MONTH.	MALES.	FEMALES
January	7.56	8.07
February	6.81	6.92
March	8.68	9.42

April	8.69	9.05
May	8.86	8.17
June	8.57	8.03
July	11.76	11.52
August	10.13	9.13
September	6.94	7.36
October	7.17	7.03
November	6.72	6.77
December	8.11	8.53

It will be observed that the months in which there is the greater percentage of the deaths of females than of males are, in order, beginning with the one in which the difference is greatest, March, January, September, December (same as last), April, February, November; and the months in which there is a lesser percentage of the deaths of females than of males are, in like order, August, May, June, July, October. In comparing the weekly mortality of the two sexes, I find that the week ending March 24th is the one in which the excess in the number of deaths of females is greatest, there being 190 to 161 of males; and that the week ending September 1st is the one in which the excess in the number of deaths of males is greatest, there being 195 to 135 of females. In London, from 1845 to 1874, on the average, the months in which there was a greater mortality of females are, in order, beginning with the one in which the difference is greatest, December, January, February, September, November, March; and the months in which it was a lesser are, in like order, June, July, May, April, August, October. It has been observed of the mortality of males and of females, in London, and the same observation holds good in regard to it in Philadelphia, that the time of the year when the death rate of females is higher than that of males, is when diseases of the respiratory organs are most fatal, and the time when the death rate of males is greater than that of females is when diseases of the nervous system are most fatal. The months in which more females than males die are also, in both cities, the months, on the whole, in which the ordinary zymotic diseases are most fatal. The order of fatality of the four quarters of the year in Philadelphia is the same for either sex, and is as follows: The third, the second, the first, the fourth. The order of the months, according to fatality, for males, is, July, May, August, January, April, October, June, March, December, February, September, November; and for females, July, May, January, March, April, August, October, December, June, February, September, November.

The reader will find it interesting to compare the monthly death rates of Philadelphia with those of the United States as a whole; and as a basis for other not less interesting comparisons, I quote the following remarks on the death rate of London, by Mr. Buchan (op. cit). The mortality from all causes, and at all ages, shows a large excess above the average from the middle of November to the middle of April, from which it falls to the minimum in the end of May; it then slowly rises, and in the third week of July suddenly shoots up almost as high as the winter minimum of the year, at which it remains till the second week of August, falling thence, as rapidly as it rose, to a second minimum in October." The order of fatality of the months, on the average, for the years 1845–1874, in London, is, December, February, January, March, August, November, April, July, May, October, June, September.

In this connection, I may quote the following from Dr. Thomas Bateman's "Reports of the Diseases of London" (1819), as the order of fatality of the months in that city, on the average, from 1732–1746: January, March, February, May, November, December, September, October, April, August, June, July.

It would be interesting to look for the reasons why each of the months is not equally fatal to both sexes, and to dwell on many points suggested by what precedes; but space forbids me to prolong the study. I may remark, however, in conclusion, that if the facts, and their bearings, of meteorology were understood, and properly regarded, the mortality of the sex should not vary much from month to month. Of course, at present a great deal is done to counteract the effects of the weather throughout the year, but from the figures given above it may be justly inferred that much more might be done.

MULTIPLE CEREBRO-SPINAL SCLEROSIS AND PARALYSIS AGITANS.

BY HUGO ENGEL, A.M., M.D.,

Lecturer on Electro-therapeutics at Jefferson Medical College, Physician to St. Mary's Hospital, etc., etc.

Only a few years ago a celebrated professor, when lecturing on paralysis agitans, included in his classical description of this disease many symptoms which we now know, at least since Charcot's clinical observations, are diagnostic of an entirely different disease, viz., multiple cerebro-spinal sclerosis. The importance of recognizing which of the two affections we have in a given case before us is so great, as regards a prognosis quoad vitam, that I think it not superfluous to place the two following cases on

record, which several months ago came under my observation, and I consider their publication the more indicated, as both were typical cases of the diseases they represent, and as they will give me the rare opportunity of illustrating on them the main and salient points of difference between the two affections. Before reporting the cases and commenting upon them, I wish to say that I shall not allude, in these following lines, either to chorea or to cerebral or spinal sclerosis alone. The first two can never be mistaken for paralysis agitans, while the latter gives us the picture of a chronic myelitis, which, in reality, it is, and whose symptom-complex will vary according to the fact if the anterior or posterior columns or any other part of the medulla spinalis are the seat of the lesion. We must, besides, not forget that paralysis agitans is never based on recognizable anatomical changes in cord or brain, though it may (F. Schultze) occasionally be accompanied by sclerotic nodules; while in multiple cerebro-spinal sclerosis we have always to do with an affection resulting from severe morbid lesions in the nerve centres. Of paralysis agitans, so many carefully executed post-mortem examinations have failed to show any lesion whatever (Kuehne, Charcot, Joffroy, etc.), that we are forced to admit that this disease is not based upon visible anatomical lesions, and that the cases in which (Skoda) gross alterations were found had been simply complicated by such, but were not produced by them. Of multiple sclerosis, though, no case has as yet been found except accompanied by its characteristic lesions. As now well known, the alterations appear in more or less numerous spots and nodules, scattered all through the nerve centres, and are mostly visible to the naked eye. These spots have a grayish-yellow color, are of jelly-like consistence, more or less sharply circumscribed, when older, somewhat denser than the surrounding healthy nerve structure, from half an inch to even four inches long, and present under the microscope the type of an interstitial chronic myelitis. The trabeculæ of the neuroglia are thickened, and we find in these sclerotic patches proliferation of the nuclei, large spider cells, gradual transition into fibrillated connective tissue, parallel bundles of fibrils close together, and between them remains of the medulla, fat and granule cells, free fat, etc., (Erb). This the lesion in multiple sclerosis. As before mentioned, there is no lesion in paralysis agitans common to every case; no lesion that with good cause could be considered the anatomical basis for the disease.

B. C., 63 years old, used to work at heaters, and mostly in cellars. He came to me September, 1878, and gave the following history of himself: Mother died in childbed, two days after he was born. Father lived to high old age, and succumbed to apoplexy. Patient had only two brothers; one of them was killed in the war; the other, only two years older than he, is alive and well. Six years ago, after he had been working for a whole week in a cellar in which there had been a great deal of water, which, in order to enable him and his fellow workmen to put up the heater, had to be pumped out, he went home on a Saturday evening, feeling unwell and chilly, and being utterly exhausted and tired. He slept fairly during the following night, but the next morning seemed to be "stiff all over." When reaching out with his arm to grasp the coffee pot, at breakfast, he felt his arm trembling. He had never been drinking to any excess, but had taken, while working in the damp cellar, every day, two small doses of whisky, to "warm himself," and attributing the trembling to the whisky drinking, a fact of which he often before had heard people talk, he took a good dose of the stimulant, to "steady himself," but without effect. The trembling never left him any more. He worked then with his left arm, but soon this too became affected. A year later he found his legs trembling, until he gradually got into his present condition. His strength, which seemed to him for a long time after the beginning of the trembling not to be affected at all, had later gradually left him; he walked now as if he wanted to fall forward all the time, and touched the ground almost only with his toes; and as far as muscular force is concerned, he presented the picture of a physical wreck. He could not hold a hammer tightly in his hand; the trembling was continuous, day and night, and only somewhat less marked in lying down; when sitting quietly the trembling did not seem so strong, but it never was absent. His muscles all over the body were somewhat atrophied, felt very hard to the touch, and there existed a slight contraction at the elbow and knee joints; the joints all felt more or less stiff; his head did not tremble; when speaking it sounded somewhat like stuttering, and this again was undoubtedly produced by the trembling of his muscles, and not due to disturbed innervation. The sphincters of the bladder and rectum were unaffected; he had a feeling of numbness and pricking sensations in his hands and feet; and the electrical test gave proof of the existence of some anæsthesia in the forearm and inner sides of his legs. A slight systolic murmur was heard over the heart, with its point of great-

est intensity just above and to the left of the apex beat; the heart seemed to be in a state of dilated hypertrophy.

We had, therefore, here a case of an old man, with possible regurgitation of the mitral valve, who came from a family with no neuropathic history, who, after exposure to damp, while hard-working, was seized with a tremor, that gradually invaded all the muscles of the body. This tremor was not influenced by psychical excitations or voluntary motions; it continued in any position the patient might occupy, erect or recumbent; the head was not appreciably affected, neither the sphincters of bladder nor rectum; there were disturbances of general sensibility, and in the same ratio as the duration of the tremor, *i.e.* the length of time of its existence, increased, paresis of the muscles set in and progressed; the functions of the brain, the faculty of speech included, were not affected.

No remedy except hyoscyamus seemed to be of any avail; the extract of henbane was gradually increased to gr.xxj, t. d., when the tremor had nearly totally ceased. I had cautioned the patient never to omit his medicine (in pill form), but one day he did so, notwithstanding my directions, and the tremor returned with an intensity it had never shown before. The patient concluded, therefore, that I was only experimenting with him, and no persuasion could ever bring him to my office again.

Toward the end of last year I was called to see H. R., a physician. The patient, when I saw him first, was in the following condition: When sitting or lying quietly in the recumbent position, nobody would have thought of the presence of any disease. But as soon as the patient made the slightest motion all the muscles used for that purpose would commence the most violent shaking, and if the patient tried to stand, the paresis of his legs and the violent tremor, which at that same moment affected every muscle of his body, the head included, would prevent him from doing so, so that he had to be supported, to prevent him from falling. Some of his motions were clearly ataxic. The urine had an ammoniacal odor, and was more frequently passed than is the norm, even during the night; symptoms which, I am satisfied, were not due to a coexisting but well attended to stricture, but to the spinal lesion. The speech was a scanning one; his eyesight had become worse; his memory failing; there was no disturbance of sensation, but the muscles did not react equally well to the faradic current; the muscles of the extremities were in a state of paresis; the bowels inclined to diarrhœa; the abdomen was tympanitic and swollen; the extensors, especially those of the left leg, were hard and tense; a slight contraction existed at the left knee; otherwise the muscles, when at rest, felt flabby. Besides the cerebro-spinal one, there was no organic lesion, except some slight old consolidation of a part of the apex of the right lung.

From the reasons given above, it will be concluded that walking was impossible. I elicited the following history: R.'s father had, according to description given me, died of some bulbar trouble. About four years ago R. had occasionally giddiness, headache, and two years ago, a kind of apoplectic attack, after which the muscles of his extremities became weaker and weaker, until at last almost paraplegia set in. To the paralysis was later added a violent shaking, which would only take place on motion, but never when the patient was in a quiet position. Every six weeks so-called stomach crises set in, lasting about two days each time.

We have here some dizziness, uncertain gait, an apoplectiform attack, gastric troubles, paralysis, then tremor, disturbances of coördination, some rigid and partially contracted muscles, bladder symptoms and phenomena of beginning bulbar affection. And what made the latter case a more typical one yet, was the result of treatment.

When seeing the patient first, who some months before had been forced, by his failing strength and increasing paralysis, to give up a highly lucrative position, he was so weak and shaking that he could not perform alone the most necessary functions of the individual. Recognizing his trouble, I gave him nitrate of silver, used electricity, and recommended manipulation. By the latter I do not mean the foolish rubbing and pinching of the bare skin, as is, I am sorry to know, often employed yet under the name of massage, but that manipulation which is based on good anatomical and physiological knowledge, as taught by the Swedish gymnastic cure, and as in this city it is made use of in the most skillful manner by only one gentleman, a disciple of Eulenberg, Mr. J. Ruebsam.* Perhaps only by this manipulation the patient was able in a few months to walk all over his house, and soon after to attend to his practice again. I am sorry, though, to know that there is no case on record as yet, in which these sudden ameliorations and improvements, setting in often after the most different kinds of, and sometimes without any, treat-

*His office is 1202 Vine Street.

ment, ever were of long duration. They are almost pathognomonic of multiple sclerosis, and may continue for some years, but at last the symptoms all return with renewed vigor, and to more apoplectiform attacks difficulties of deglutition and respiration are added, bulbar paralysis makes more and more its sad appearance, and inevitably at last death sets in gradually, or some intercurrent disease ends suddenly the miserable existence.

These remarkable ameliorations can, in my opinion, only be explained by the following theory: The motor impulses from the brain and the sensory impressions from the periphery select new paths along which to travel, and suddenly all the pathological symptoms disappear, as soon as they have succeeded in establishing the new paths; after a while—longer or shorter—these new channels, too, are invaded by the sclerotic process, and the disease shows itself again in its full power, until at last the morbid changes, especially those in the medulla oblongata, are not consistent with life any more, and the curtain drops.

In conclusion, I shall group the main differential symptoms of multiple cerebro-spinal sclerosis and paralysis agitans once more, in a tabular form.

MULTIPLE CEREBRO-SPINAL SCLEROSIS.	PARALYSIS AGITANS.
First appearance at the age of 20–45 years.	Always after 55 years.
Commences with vertigo, uncertainty of gait, psychical disorders, headache.	No brain symptoms.
This is followed by paresis and paralysis, to which later the shaking is added.	Begins with fine tremor, after whose existence for some time gradual impairment of motion sets in.
Impairment of sight, nystagmus and impairment of speech.	No such symptoms.
Rarely ever, and then very mild, sensory disturbances.	Always disturbances of general sensation.
Apoplectiform attacks, gastric crises.	No such symptoms.
Tremor consists of long oscillations, real shaking.	Tremor resembling very small, fine oscillations.
Shaking only on motion.	Trembling constant, not specially influenced by motion.
Disappears in recumbent position totally.	Does not change by position.
Head always affected.	Head never affected.
Bulbar symptoms.	None.
Bladder and rectum always implicated.	Never affected.
Occasional sudden disappearance of all the symptoms for greater or lesser time.	Continuous to death from other cause.
Always fatal.	Does not seem to influence duration of life very much.

It does not appear to me possible that any of the above-mentioned diseases could ever be mistaken for chorea. A comparison of the symptoms of the latter disease with those described in this article will show the difference. The lancinating pains, the absence of tremor and of disturbances of speech, the reeling on the eyes being closed, and the non-appearance of the psychical and other brain symptoms, prevent us from mistaking locomotor ataxia from the affections we had here to do with.

319 *North Fifth street.*

TREATMENT OF STRICTURE AND GLEET WITH GALVANISM, WITH REPORT OF CASES.

BY O. E. HERRICK, M.D.,
Of Greenville, Mich.

While using the galvanic current in the treatment of uterine diseases, the application of which was described in a previous number of this journal, I determined to try its efficacy upon the above mentioned diseases. Having a couple of cases on hand, I proceeded in a similar manner to that described by me for the relief of ulceration of the os uteri and vaginal leucorrhœa, viz., by simply attaching a copper wire to a silver catheter at one end, the other end to a zinc plate held in contact with the body by a bandage, while a sponge acidulated with vinegar was placed in contact with the zinc; this produces a current sufficiently strong for the purpose. I have found that patients are usually enabled to wear this apparatus twelve hours out of the twenty-four, say six hours during the day and six at night. The results have been most satisfactory to me; perfect success has attended its application in every case.

Case 1.—Mr. L., aged about 45 years, had contracted his first gonorrhœa about twenty years ago, which was followed by a stricture. He submitted to some kind of an operation, which, he says, relieved it until he contracted gonorrhœa a second time, several years after, when he was again troubled with the stricture, but did not have another operation performed, and it has troubled him at intervals ever since; but he had learned to introduce the catheter himself, and got along without serious trouble until about six months ago, when it became so bad that he could not introduce the instrument himself; he then

called in a physician, who, after repeated attempts, also failed to introduce it; another physician was called in to assist him, when they concluded to administer chloroform, which they did, and after operating two hours, and failing, they desisted, and left him for the day, but returned the next, and after again chloroforming the patient, succeeded in making a false passage, but did not get the catheter into the bladder; they then desisted and again left the patient to himself, who during the night succeeded in emptying the bladder, probably from the relaxing influence of the chloroform. He continued having more or less trouble in passing his urine for a couple of months, when I was called in, and found him in great pain, and discharging large quantities of pus from the false passage in the urethra, while the stricture was as troublesome as ever. I attempted to pass a No. 6 catheter, but the parts were so tender that I was forced to cease any further efforts in that direction. I then applied the apparatus described above, putting it on about 4 o'clock, P.M. He wore it until 12 o'clock, P.M., when I again saw him; the pain had almost entirely subsided, and when I removed the catheter (which had only been introduced as far as the stricture), he was able to pass his urine with little trouble. I left it out until 9 o'clock the next morning, when I again applied it, and left it until 2 o'clock in the afternoon, at which time I again saw him. He had been entirely free from pain, and the discharge had almost ceased, while I found no trouble in passing a No. 6 catheter into the bladder. The treatment was continued for five days, when I discharged my patient, with the instruction to wear the apparatus two or three hours out of the twenty-four for a week or ten days longer, which he did, and he now reports that he has had neither discharge nor stricture since, and declares himself as well as ever.

CASE 2.—Mr. B. contracted a gonorrhœa about fifteen years ago, and has suffered from stricture at intervals ever since. He also had learned to pass the catheter himself, but about two months ago his stricture had become so bad that he was no longer able to pass the instrument himself. I was called then, and after considerable difficulty succeeded in passing a No. 5 catheter, after which he was treated the same as Case No. 1. He wore the galvanic apparatus about one week, and has had no return of either stricture or soreness since.

I am aware that galvanism is an old remedy in the treatment of strictures, but the manner of application is, I believe, new, and perhaps will be of interest to the numerous readers of the REPORTER. Galvanism as heretofore tried in cases of stricture, has been with a battery, and could only be tried by sittings of from a few moments to an hour at the longest; while the current was necessarily stronger than by this method, to which fact, I believe, may be ascribed the many failures to get the relief galvanism should afford in such cases.

HOSPITAL REPORTS.

PENNSYLVANIA HOSPITAL.

CLINIC OF PROF. J. M. DA COSTA.

REPORTED BY FRANK WOODBURY, M.D.

(*Concluded from p.* 342.)

Cases of Bright's Disease Continued — Treatment of Uræmia.

Here is our uræmic boy. You would hardly recognize in this bright boy, who walks into your presence this morning, the one who was carried in at our last lecture, dull and stupid, and threatened with coma. I take him up again this morning to let you know what has happened since you saw him when suffering from uræmia. In regard to the treatment, it may be stated in brief, that he took large doses of benzoic acid for a few days, with marked benefit; he passed urine freely, and became less and less drowsy; the kidneys acted well. I must not forget to say that free purgation has been a part of the treatment. He was dry cupped over his loins, followed by hot applications, and had several vapor baths, that produced general perspiration. At the end of the fourth day I stopped the benzoic acid, as it began to disagree with his stomach, and put him upon another acid, muriatic, of which he took ten drops three times a day. He is now doing well.

Death from Uræmia.

We will take up again, for a moment, another of these cases, that of Theodore J., of bed No. 8, men's medical ward. He was the last of the series shown at our clinic one week ago. He was taking Basham's mixture, you will remember. It was a case in which great changes were going on in the eye, for I read the report, showing the condition of albuminuric retinitis.

This patient has died since last Saturday, though not in this hospital. He went out on a pass, on the same day that you saw him, and died two hours afterward, in convulsions. The report was brought to us after he was dead; we, therefore, did not see him during his attack, but I can tell you how it happened. He died of *uræmia*. The case of uræmia in the boy was in a similar danger of death, but it was averted by proper treatment. The man, most likely from some exposure, had stoppage of secretion from the kidneys, and at once uræmic convulsions overtook him. I do not know whether or not all the consequences could have been averted had he remained in the hospital, but we might have saved his life.

Effects of Chronic Alcoholism—Chronic Interstitial Nephritis—Cirrhotic, Granular or Contracted Kidney.

The next case is that of George D., occupying bed No. 34. He is thirty-eight years old, and has been a hard drinker for years. He has had delirium tremens twenty-four times, and has had some of the not unusual consequences—fractures of the femur and skull, and a number of smaller injuries. For many years he has been in the habit of rising once or twice at night to pass his water. The last attack of delirium tremens was in July, 1877, and subsequently his mind became so affected that he was sent to an insane asylum.

You have here a long-continued and decided history of alcoholism. After exposure to cold and wet, about eighteen months ago, he noticed a general dropsy commencing in his feet; his abdomen subsequently became very much swollen. The attack was accompanied by lumbar pains, frequent micturition, nausea and vomiting. This attack passed off under treatment, but left him subject to swollen ankles. He had some œdema of the feet when he was admitted, June 31st, 1878; he had also moderate ascites, which passed away under treatment.

Now, gentlemen, as regards the other evidences of disease, we found the urine of specific gravity 1.018; it contained about one-fourth albumen; he passed five pints daily; therefore, the amount was copious. A few hyaline and fatty casts were found in the fluid. The examination of his eyes showed that both disks were the seat of granular degeneration of the choroid—one of the forms of albuminuric change.

He has improved very much under treatment. He has been taking, for a long time—

℞. Tinct. ferri chlorid., ♏x
Syr. limonis, ♏l
Aquæ, ʒiij. M.

Taken thrice daily, in a wineglassful of water.

A little wine has also been given him occasionally, but no spirits; he has had a good, nutritious diet.

His dropsy has wholly disappeared, and were it not for his blood, which is not thoroughly in good condition (his face is pale and his conjunctivæ pearly), and were it not for the presence of disease of the kidney, which we have determined by the albuminuria and casts, you would not think him a very sick man. I will examine his lungs. His chest is a little less clear on the left side than upon the right; the respiration, also, is not quite so distinct on the left, but there is no evidence of marked lung trouble; yet I should, in fairness, tell you that he has had a number of attacks of severe cough, and has been spitting small amounts of blood since admission, though from congestion of the lungs, not connected with any permanent organic lesion. The heart impulse is marked and distinct; percussion dullness is increased, therefore, a moderate amount of cardiac enlargement exists, or more exactly, hypertrophy with commencing dilatation. Thus far we have examined the heart and lungs. Passing to the liver, we find that it comes barely to the border of the ribs. The spleen is slightly enlarged. There is no ascites at present, and no swelling of the surface; the dropsy has entirely disappeared.

What is the matter with our patient? Of course, he has Bright's disease; that is agreed upon, as the case belongs to the series we are discussing; but what form? In this instance I show you a case of contracted kidney, a cirrhotic kidney, a gouty or granular kidney. All these names are given to it, and it is sometimes called the alcoholic kidney, to show from what the disorder arises. In other words, you have the changes that occur in the organ as it undergoes fibroid degeneration, and afterward contracts. The tubular part of the kidney becomes more and more compressed and atrophied, the degeneration also seriously involving the secreting and cortical substance. From the progressive deposit, and consequent contraction, result the granular degeneration and cirrhosis. The condition of the tubules is partly the result of the pressure of the new deposit, and partly from direct involvement in the inflammatory changes.

Now, gentlemen, this cirrhotic change is not uncommon in persistent alcoholism; for the abuse of spirituous liquors tends directly to cause this form of kidney disease. We have before us a case that is typical of the condition, and which follows the rule as to its causation. He has immensely improved under the treatment, and by abstinence from spirits. He has been taking iron, in one form or another, for a long time, and due attention has been paid to his diet and his secretions.

Albuminoid or Amyloid Kidney.

I will now refer, in order to make our series complete, to a case of albuminoid kidney which has been some time in the hospital. His name is James H., 26 years of age, a segar maker. There is an old history of hip disease, following an injury at nine years of age, when he fell and sustained a dislocation of the left hip, and other injuries. Three years later abscesses appeared in the groin, and pieces of necrosed bone were discharged, and from that time to the present he has suffered, more or less constantly, from chronic hip joint disease, which now presents the characteristic deformity. He was generally pale, weak, and anæmic looking.

The urine was usually normal in quantity, the daily discharge measuring about three and one-half pints. It was decidedly, although not heavily, albuminous, and contained a few granular and large waxy casts, which were not very numerous; it required a number of examinations to detect them. Upon examination, we found that with this chronic suppuration of the bone there was enlargement of the liver. It was, beyond all question, the seat of albuminoid degeneration, in which the kidneys also participated. There were no heart murmurs; the lungs were normal. I will only add that this man had marked dropsy. He was put upon fluid extract of jaborandi, fifteen drops every third hour, and has been steadily improving. He has also been taking iron.

Acute Exacerbation of Cirrhotic Kidney, with Peritonitis and Pleurisy, Simulating Typhoid Fever.

This is a case in which there is an element of

doubt as to whether it belongs in the series; but let us consider it further. The boy was admitted in a state of collapse. He was taken sick in the ship six weeks ago, and he has been on shore for four weeks. He had diarrhœa, which continued until a few days before admission, lasting, therefore, at least, six weeks. It was persistent, and has since returned. Scybala and mucus, but no blood, were noticed in the discharges. Three weeks ago he had epistaxis; he never had delirium, but he had fever, and was confined to bed ever since leaving his ship. Therefore, for four weeks, even prior to his admission to the hospital, he was confined to bed. He had headache almost all the time. Three weeks before admission great prostration began, with swelling of the abdomen, and the parts were tender. When he entered the ward the pulse was 120, respiration 128, and temperature 100. He was so collapsed after being brought here that an accurate physical examination was impossible. But we recognize peritonitis; also right-sided pleuritic effusion, with partial consolidation of the lung. We tested the urine, and found it contained albumen to a moderate amount (about one-twelfth). But under the microscope it showed a large number of granular casts; some of them were fatty.

This, then, is the record prior to your seeing him this morning. But you find him here in very much better condition than when I first saw him. He is now quite over his collapse. This was accomplished by steady stimulation and a moderate use of opium. Although the temperature was as high as 106°, it has now declined to 101° this morning. He has still the fever-pulse, but it is of much better volume. His abdomen is still somewhat tender and large, but nothing like what it was, nor so distended; the peritonitis is clearly passing away. The heart sounds are feeble, or, to speak more correctly, the first sound is short and sharp, like the second sound, but no murmur exists. Examining the back of the right lung, which I told you had been so congested, we find it is somewhat dull on percussion, but the respiratory murmur is heard tolerably low down; it is evident that the lung is still somewhat congested, but the effusion has largely disappeared.

What is the matter with this patient? Two things might be supposed; two perfectly tenable views might be advanced. And in the absence of a distinct history, which it was impossible to get here, we must choose between these two; either the patient has had typhoid fever, with peritonitis, and the lung complication of typhoid fever, and the kidney complication of typhoid fever, or he has not had anything of this kind, but has had a kidney disease of long standing, with pleuritic and abdominal effusion as a consequence. Between these it is difficult to decide. And I will discuss them, premising that the difficulty is so great that we may chance to be wrong in our conclusion. This doubt will arise in any case, however simple, where we do not know the early history. I believe that it is not a case of typhoid fever. I believe that the view that it is a case which had its root in the kidney disease, with peritonitis and pleurisy superadded, is the correct one. You will say, there is the epistaxis, headache, fever, and the age of the patient. These are all strong points in favor of typhoid fever. You may even say that the congestion of the lung was in favor of typhoid fever, but I still think that the balance of evidence is in favor of the other view.

Let us take these points up for discussion. First, the epistaxis. This we find did not happen till he had been ill three weeks. Please mark this. This is not the kind of epistaxis we have in typhoid fever; it is an early symptom in typhoid, not a late one. Therefore, the time of the occurrence is very important. But epistaxis is also a symptom of Bright's disease. It appears in Bright's disease when the kidney disorder is chronic, and when an exacerbation occurs in the course of the chronic malady. The epistaxis, in the present case, then, admits of this explanation.

Now, for the peritonitis. Does this happen in typhoid? Yes. In Bright's disease? Yes; not unfrequently. But when does it happen? Peritonitis in typhoid occurs with the acute symptoms; peritonitis without perforation is so rare that its possibility has been denied. I will not say so, but will state that, as a rule, it happens after perforation, coming on directly. It was not so here. In typhoid fever it is very unusual to see a case of peritonitis of gradual development. Then the course which the peritonitis has taken is against this view.

Let us turn to the other side of the question. Does peritonitis happen in Bright's disease? It does, at times, and in a very chronic form, and is part of the influence upon serous membranes peculiar to Bright's disease. That such an influence exists in the present case is shown by the coexisting pleuritic effusion. So you see that the case can be explained on the supposition that it is Bright's disease, as well as that it is typhoid fever, and rather better by the former than the latter.

Now, the kidney. You will say that the examination of the urine settles the question. The casts show that it is a case of Bright's disease, and not typhoid fever. But kidney disease may happen as a consequence of typhoid fever. You will not, therefore, be able to lay much stress upon it in the diagnosis. This is the least valuable point in the argument, although we must admit that it is a point. But when I look at the urine report, I find the amount of the albumen moderate, and the tube casts are granular and fatty. Now, a moderate amount of albumen happens in a kidney complication of typhoid fever, but it also happens in some of the chronic forms of disease of the kidney, just as in one of the preceding cases I have shown you, where there was granular contracting kidney. I lay particular stress upon the microscopic appearances, the granular and fatty tube casts. These microscopic appearances are in favor of old kidney trouble, rather than the acute kidney complications, such as would occur in typhoid fever. This is the one point in the case that shows the existence of old kidney disease. In typhoid there are small amounts of albumen and few epithelial casts. The granular and fatty casts belong to old Bright's disease.

I have endeavored to show you that this case may, after all, belong in my series. He has been taking

five drops of laudanum ever hour, with reference to the peritonitis, turpentine stupes and subsequent blistering, and he had enough stimulant to sustain him, half an ounce every two hours, which was found to be absolutely necessary.

Now, what change shall be made in his treatment. You see him better as regards the peritonitis; the pleurisy I have already referred to as having disappeared. Shall we go on with the opium treatment, though, perhaps, not pushing it as actively as before? On account of the Bright's disease my opinion would lead me to discontinue it, as we run a risk of checking the secretions of the kidneys and of producing uræmic convulsion. You remember that I told you that in kidney disease opium must be given with great care. As he is getting so much better, I will reduce it to five drops every third hour, and discontinue it as soon as possible. A blister shall be applied to the right side, followed by poultices. We will also give him ten drops tincture digitalis every three hours, partly to control the circulation and partly to act on the secretions. As he still has diarrhœa, we will give him a suppository of five grains tannic acid and one grain opium, morning and evening.

This completes the series of our Bright's cases. Unfortunately, this last case, which has just come in, has so interested me that it has consumed the time which I had intended to devote to reviewing the cases that have been brought before you. Your notes include, in the series just shown you, cases of all the ordinary varieties of Bright's disease, from the acute attack of parenchymatous nephritis to the more chronic forms of cirrhotic and albuminoid disease of the kidney, including cases exhibiting an acute exacerbation in the course of chronic disease, even simulating typhoid fever. Their clinical histories and points of diagnosis are still fresh in your minds, and the principles of treatment I have indicated in passing. They are to watch the function of the kidneys, and if there be insufficient elimination of urea and waste products, as shown by a marked reduction of the proportion of solid matters in the urine, even though the water may retain its usual standard, or even be increased, you must treat your case as if threatened by great danger. And the onset of uræmia is all the more to be suspected if the patient be rather drowsy, or complain of dull headache, particularly if otherwise unaccountable and persistent vomiting come on, with a clean tongue, and with constipation. As a rule, in the treatment, I have found that the greatest reliance is to be placed in remedies that build up the system and improve the condition of the blood; iron, in one form or another, is almost indispensable. In chronic parenchymatous nephritis ergot is valuable, especially if an acute attack is superadded, with more or less congestion of the kidneys. For the relief of the dropsy we have Basham's mixture and digitalis. Jaborandi is still under trial, but in my experience has proved itself to be the best diaphoretic that we possess.

Periscope.

Treatment of Catarrh of the Stomach.

Dr. Kuster, of Berlin, quoted in the *British Medical Journal*, says he has had a great deal of experience in the treatment of the above-mentioned disease. He does not approve of the use of the stomach pump, it being rather an awkward and unwieldy instrument to handle, both for physicians and for private patients, who generally object to it. Among the large number of drugs which have been used in gastric catarrh, he decidedly prefers only three, viz.: hydrochloric acid, Carlsbad salt, and nitrate of silver. He administers them in the following doses: Of hydrochloric acid he gives from five to eight drops, to be taken in a wineglass before and after meals. The dose of Carlsbald salt is one or two teaspoonfuls dissolved in hot water daily. Nitrate of silver is given in the form of pills, containing each 5 milligrams (.075 grain) of nitrate of silver and 7 milligrams (.105 grain) of extract of belladonna. Each of these drugs seem to fulfill special indications, and to counteract in some way the effects of the other. According to the author's theory, they should be used as follows: Hydrochloric acid is only useful in such cases where the catarrh of the stomach or the disagreeable sensations experienced shortly after food are caused by a scanty supply of the gastric juice, especially gastric acid. It will also prove very useful when the patient complains of loss of appetite, pains and pressure on the stomach after food, especially after meat, and of profuse diarrhœa, but does not suffer from flatulence or acid eructation. These symptoms are caused by the want of acid in the gastric juice, and will, therefore, be removed as soon as an acid is introduced. Persons who smoke generally suffer from want of gastric acid, the secretion of which is probably rather lessened by the nicotin which is swallowed in smoking. Carlsbad salt must be used in cases which are diametrically opposed to the above-mentioned. It is most efficacious in neutralizing the surplus amount of acid, when there exists an over-secretion of it, and in cleansing the stomach from large quantities of mucus, which generally accumulates in it. It acts in a certain way very much like a stomach pump, *minus* the disagreeable sensation of having a tube put down one's throat. As for nitrate of silver, it has not been proved in what cases it is most efficient. It has been used a great deal in ulcers of the stomach; but the author is of opinion that this is rather a danger-

ous practice. He has given it without any special indication in cases where there were no symptoms of ulcers, and has always found it to be extremely useful. He has also used it with some success in the treatment of females having a tendency to chlorosis and nervous irritability.

Tartrate of Morphia for Hypodermic Injection.

Dr. J. A. E. Stuart says of this substance, in the Edinburgh *Medical Journal*—

Tartrate of morphia is a white powder, not at all unlike the muriate of morphia in appearance, bitter to the taste, and although quite soluble in cold water, yet the solution so formed is milky, so it is better to use hot water. It is soluble in water to a great extent, without either the aid of acids or spirits; indeed, the solution for hypoderimc injection made from it is of the same strength as the Pharmacopœia injection, viz.: 40 grains to the ounce, or, in short, 1 grain of the tartrate in 12 minims of the solution, so that 2 or 3 minims is sufficient for an injection. The advantages which this solution possesses for hypodermic injection are these: 1. It is bland and unirritating, being as mild as water, whereas the Pharmacopœia injection is intensely irritating, even when prepared by the most experienced chemists. 2. The solution of the tartrate can be kept fresh for any length of time, while the Pharmacopœia injection soon changes color and goes wrong. 3. The ease with which this solution of the tartrate is prepared, by merely weighing out the quantity and dissolving it in a certain measure of hot water. The tedious process of the British Pharmacopœia, consisting of repeated filterings and neutralizings, stands out in contrast to this easy process. 4. The concentrated nature of this solution renders it a very convenient form for administering by the mouth, as it occupies such a small space, and can be carried most conveniently.

Kumyss in Infantile Diarrhœa.

Dr. E. F. Brush says, in the New York *Medical Journal*—

It is to me a fact conclusively demonstrated, that all diarrhœas of infants commencing with green discharges are due to the non-digestion of sugar; and secondly, I believe that the larger percentage of intestinal disturbances in bottle-fed children is due to the unfixed condition of the casein; that is, the casein is in a fit state to undergo rapid change, notably, the hard coagulation due to lactic fermentation, followed by putrefaction. For instance, city milk, when delivered to the consumer, is ordinarily from thirty-six to forty-eight hours old, by which time lactic fermentation has always commenced. When milk of the above age does not affect the litmus, its acidity has been neutralized by the addition of lime or soda, and this neutralization, by the way, increases the action of the lactic ferment. When the milk reaches the stomach, where the temperature is increased to above 95° Fahr., the most favorable degree of heat for lactic fermentation, the latter becomes very rapidly complete, and the hard, indigestible coagulation takes place. After lactic fermentation is complete, putrefactive fermentation immediately follows. This is the condition when vomiting occurs, and any of the casein which reaches the intestinal tract acts as an irritant, on account of the putrefaction that is taking place.

Now, the beneficial effect of kumyss in diarrhœal diseases is accounted for, first, by the total absence of milk-sugar which characterizes it, this principle having been broken up into alcohol, which answers the double purpose of being a hydro-carbonaceous food and of promoting absorption; secondly, by the fixed condition of the casein. In kumyss we find this principle finely subdivided, ready for absorption, incapable of being coagulated, or, under ordinary circumstances, of undergoing putrefaction. Last summer I took a specimen of kumyss and the same quantity of the milk from which the kumyss was prepared, and placed them both in open vessels in a window, the weather being very warm. When, after a few days, I examined them, I found the milk alive with maggots about an inch in length, and giving off a very offensive odor, while the kumyss was practically unchanged, there being no evidence of life about it, the taste being that of ordinary kumyss, and the odor simply that of new cheese.

Ergotine Suppositories in Uterine Fibroids.

The following is one of several cases reported by Dr. Robert Bell, in the *Lancet*:—

The patient, eight years ago, fell from a height of six or seven feet while swinging on an ordinary child's swing. This gave way, and she was precipitated on her back, whereby the uterus was displaced backward. From the date of the accident she has been more or less lame, the pain, while walking, always being located in the sacral region. About eighteen months ago she fancied the abdomen was swollen, she experienced a feeling of fullness in the pelvis and a difficulty when at stool. On examination, I found the uterus to be acutely retroflected, and the fundus was very much enlarged, quite to the extent of a pregnancy of two months. The contour of the tumor was quite regular. I suspected a fibrous polypus, and with a view of bringing this into the vagina, a suppository containing four grains of ergotine was ordered to be used every night, irrespective of any bloody discharge from the uterus, as this was both frequent and copious. This treatment was pursued for three weeks, when the tumor was expelled. It presented the appearance of a fibroid undergoing decomposition, but there was no smell indicating putrefaction. Studded over the surface of the mass were large areas of fatty deposits, and the whole tumor was in a state of fatty degeneration. The subsequent treatment of the patient consisted in passing the sound and rectifying the position of the uterus twice a week, and introducing behind the organ a plug of cotton saturated with glycerine. This was done for four weeks, after which I introduced a Hodge pessary, and now the patient expresses herself as feeling perfectly well.

I would urge all who would employ ergotine in such cases, or, indeed, in any disease, to be

sure that they are being supplied with a good article, or, I need hardly add, disappointment will most certainly follow. This caution is the more necessary, as ergot of rye is so often supplied to the trade which, when examined, is found to be absolutely useless as a medicinal agent. We cannot, therefore, be too careful in our selection of the drug, nor too particular in our investigation of the efficiency of each individual sample.

Treatment of Whooping Cough.

Dr. J. J. Caldwell writes to the St. Louis *Medical and Surgical Journal*—

My mode of treating epidemic whooping cough was very simple and ready, viz.: to place Codman & Shurtleff's steam atomizer in position on a table before the patient, charged with—

℞.	Fl. ext. belladonnæ,	gtt vj–xij
	Ammon. brom.,	℈ j
	Pot. brom.,	℈ ij
	Aquæ dest.,	f. ℥ ij.

This spray is rapidly carried over into the face, mouth, and lungs of the child, and applied ten to fifteen minutes, until the pupils are dilated by the effects of the belladonna mixture; this application to be made morning, noon and bedtime. This has so far cut short the spasmodic cough within two or three days uniformly, and almost to a certainty. More recently we note reports of cases of pertussis successfully treated (almost instantly) by the inhalation of sulph. ether, in this instance discovered by Dr. ——, while dressing a fracture of a child suffering from whooping cough. The first administration cut short the malady then and there. The Doctor followed up this experience, with the happiest success, the history of which he has given to the medical journals, thus again sustaining my theory of its neurosis and the good effects of anæsthetic treatment.

The Magnet in Lead Palsy.

At a meeting of the Medical Society of Paris, in January last, Dr. Debove reported a case of hemiplegia, brought on by lead poisoning, cured by a single application of magnets, in a patient who was not hysterical. The patient, aged 26, a painter by profession, was received into the Hôtel Dieu in August, 1878, suffering from symptoms of lead poisoning, such as convulsions, coma, etc. These symptoms disappeared in a few days, but the patient retained a complete left hemiplegia. There is no doubt now that saturnine hemiplegia really exists, five or six cases having come under observation, the first of which has been observed and described by M. Vulpian. M. Debove was, therefore, fully justified in considering the present case as a similar one. From August till January the patient remained in the same state, without improving much. Both the mobility and sensibility of the whole left side were affected; if pricked with pins, the patient only felt the pricks on the inner surface of the arm. The left side of the tongue was affected in a similar manner; the sensation of taste was lost on the left side of the tongue; the left side of the pharynx could be tickled without provoking any reflex movement; the patient could not smell with the left nostril; his hearing was affected in the left ear; the left cornea was insensible; the visual perception had also greatly decreased; the retina was partly insensible. There were also scotomata of the left eye. M. Debove resolved, then, to try the experiment of applying a magnet to his patient. He accordingly took him to the Salpêtrière, where all the necessary apparatus are to be found. The patient's left hand was placed between the two poles of Faraday's electro-magnet, and in a very short time, not only general sensibility, but also the particular sensibility of some of the organs of sense, was restored. During the following fortnight the patient progressed favorably, and has now almost entirely recovered both sight and smell. The sense of taste alone was not quite restored, and the sole of the left foot has remained insensible.

The Exhibition of Digitalis.

The following remarks were made at a meeting of the Atlanta Medical Society, reported in the Atlanta *Medical and Surgical Journal*:—

The President desired to know the result of the administration of digitalis in the hands of the different members, and also the doses given.

Dr. Salm stated that he had given the tincture in ten-drop doses.

Dr. Cortelyou had taken Squibb's fluid extract in ten-drop doses every four hours. Reduced the frequency of his pulse very perceptibly. Alternated the digitalis with aconite. Had used it afterward in ten-drop doses, and always reduced frequency of pulse. Did not notice marked effect on urine.

Dr. Miller gave it formerly very frequently. Lately has confined its use to cases of kidney disease. Gives tincture in ten-drop doses, continued for short periods only, as he thinks there is danger in its administration for long continued periods. Cites the case of an old man with hydrothorax, to whom he had given digitalis with great relief. The following year it was prescribed by some one else in larger doses and for a longer time, and the patient died from effects of medicine.

Dr. Conally has a patient with cardiac valvular trouble, to whom he gave digitalis in two-drop doses once or twice a day. No good result followed, when he increased the dose to five drops, since which time the improvement has been marked.

About a year ago he had a case of anasarca in which he administered digitalis, but with no effect. Diuretic action of drug marked in present case; not marked in one of a year ago.

The President asked Dr. Miller if he thought the digitalis was absorbed in those cases of delirium tremens where drachm doses of the tincture were administered? Dr. Miller thought not, but gave as his opinion that full doses of *time* were the best remedy in that disease.

The President then asked if the danger from the exhibition of the remedy had not passed when the diuretic action was once produced? Dr. Miller does not use it after he obtained that result, that being the object of his giving it.

Reviews and Book Notices.

NOTES ON CURRENT MEDICAL LITERATURE.

——"The Voice," a monthly newspaper, devoted to voice culture, is published at Albany, New York, by Edgar S. Werner. The fourth number, which is before us, contains a translation from Dr. H. Klencke, on the cure of stuttering; an explanation of Gunther's method; a paper on the beginning of speech, by C. E. Smith; art gossip, musical gossip, artificial vocal apparatus, on deaf mutes, etc.

——Electrolysis as a means of removing hair is well spoken of by Dr. G. H. Fox, in a reprint from the *Medical Record*. He observes:—

"The soft, downy hairs which often grow luxuriantly upon the upper lip and cheeks of certain women are not amenable to treatment, and fortunately these are not incompatible with female beauty. But whenever the hairs grow long, and strong and dark, producing a serious disfigurement, it can be safely asserted that they may be permanently removed by means of electrolysis."

BOOK NOTICES.

Hints in the Obstetric Procedure. By William B. Atkinson, A.M., M.D., etc. Second edition. Rewritten and enlarged. 8vo, pp. 121, cloth. Published by D. G. Brinton, 115 South Seventh street, Philadelphia. Price $1.

The art of obstetrics has been, in many treatises, uselessly obscured by minute and tedious directions, while other works upon it are swelled out of all proportion by long-winded historical and pathological discussions of very little interest to any one but the extreme specialist. A book at once terse, clear and comprehensible, going right at the pith and marrow of the subject, telling the working physician or the student exactly what to do in every emergency, wasting no space in theorizing, written not from other books, but from an experience at once large and well thought out—such a book has long been a desideratum, and we venture to say that here it is. A small first edition was published by the author, and was at once exhausted by the demands of his acquaintances. A second, larger and thoroughly revised edition is now submitted to the public.

The author states his aim to be "to divest this branch of medicine of much of its mystery and dread—a dread too often shared alike by physician and patient." In his second edition the additional matter is mostly inserted for the purpose of giving concise answers to questions relating to the art of obstetrics, which had been propounded to the author by readers of his first edition. This adds greatly to the value of the book, and it may now be said to embrace in the scope of one hundred and twenty pages all the essentials of the art of midwifery.

To students it cannot fail to prove a most excellent little text book. The author is himself a medical teacher of long experience, and knows how to present his subject in a way to make it remembered. Nor is it confined in its utility to students alone. Dr. J. Marion Sims remarked of the first edition, "It is as good for the old as for the young practitioner;" and Dr. Fordyce Barker mentioned the book as one which would be of especial service to many in the profession "who have hitherto followed the routine of the old traditions." Dr. Atkinson is a firm believer in the obstetric art, and in its power to assuage greatly the pains of pregnancy and childbirth; his position is well shown by this sentence in his preface:—

"The great bugbear," meddlesome midwifery, "has too long acted to deter the physician from the performance of his duty as the assistant of nature in this sacred act of the wife and mother."

The work costs so little, one dollar, by post, to any address, that it cannot fail to be a most remunerative investment to every medical student and practitioner in the land.

The Anatomy of the Joints of Man. By Henry Morris, M.A., M.B., Lond. F.R.C.S., etc. Phila., Lindsay & Blakiston, 1879. 1 vol., cloth, 8vo, pp. 462. Price $5.50.

This handsome book contains forty-three lithographic plates, carefully colored from nature, and thirteen diagrams on wood, illustrating the various joints, with their ligaments, cartilages, muscles, and other anatomical relations. The accompanying descriptions were written by the author directly from the specimens before him, and subsequently enlarged and perfected from previous anatomical writers. They have the freshness and accuracy which are sure to result from such a plan.

Mr. Henry Morris succeeded Sir Charles Bell as lecturer on Anatomy in Middlesex, Hospital, and is a most able teacher of that branch of science. His present work is not surpassed by any on this subject known to us. It deals exclusively with anatomy proper, the surgical anatomy of the joints not being considered. The typographical execution leaves nothing to be desired.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	**$5.00**
Half-Yearly Compendium of Med. Science,	**2.50**
Reporter and Compendium, - - -	**7.00**
Physician's Daily Pocket Record, - -	**1.50**
Reporter and Pocket Record, - - -	**6.25**
Reporter, Comp. and Pocket Record, - -	**8.25**

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

D. G. BRINTON, M.D.,
115 South Seventh Street,
PHILADELPHIA, PA.

THE ADULTERATION OF DRUGS.

One of the growing evils of the day is the adulteration of drugs. The unscrupulous character of dealers who commit this crime—for it is one, although, unfortunately, not so set down in the law books—is apparent when we reflect on its appalling consequences in the prolongation of human misery and the hastening of death. It is often torture, not rarely homicide. Some notion of the extent of these adulterations, both in food and medicine, may be judged from various paragraphs which have been lately floating on the press.

Thus, the *Sanitarian* of a recent date gives these facts:—

"Several mills in New England, and probably many elsewhere, are now engaged in grinding white stone into a fine powder, for purposes of adulteration. At some of these mills they grind three grades—soda grade, sugar grade, and flour grade. I am told that thousands of tons of it have been ground in one town of Massachusetts. It sells for about half a cent a pound. Flour has been adulterated in England, and probably here, with plaster-of-Paris, bone dust, sand, clay, chalk, and other articles. I am told that large quantities of damaged and unwholesome grain is ground in with flour, particularly with that kind called Graham flour. (To detect adulterations of flour, see *Sanitarian*, November, 1877.) Certainly hundreds, and probably thousands, of barrels of 'terra alba,' or white earth, are sold in our cities every year, to be mixed with sugars in confectionery and other white substances. I am told by an eminent physician that this tends to produce stone, kidney complaints, and various diseases of the stomach. A Boston chemist tells me that he has found seventy-five per cent. of 'terra alba' in what was sold as cream of tartar used for cooking. A large New York house sells three grades of cream of tartar. A Boston chemist recently analyzed a sample of the best grade, and found fifty per cent. of 'terra alba' in that. Much of our confectionery contains thirty-three per cent. or more of 'terra alba.' The coloring matter of confectionery frequently contains lead, mercury, arsenic, and copper. Baking powders are widely sold which contain a large percentage of 'terra alba' and alum."

In the drug trade proper the adulteration is enormous and most barefaced, and grows more unblushing as we leave the eastern cities and progress west. Even in this State it is bad, as witness the following extract from the *American Journal of Pharmacy*:—

"It is high time that some means should be resorted to for preventing the fraudulent mixing and reducing of drugs, and I hope that the State Pharmaceutical Association will take this matter in charge and endeavor to have a law passed prohibiting, under severe penalties, the manufacture and sale of all adulterated articles. In some localities a conscientious pharmacist is hardly able to earn a livelihood, owing to the mean and dishonest competition which surrounds him. It is natural for people to seek the cheapest places to make their purchases, and this necessarily places the reputable apothecary at a great disadvantage. Pharmacists should endeavor to make the people understand the difference in goods of guaranteed purity and the opposite, and that the latter are dear at any price."

In a recent number of the *American Medical Biweekly*, of Louisville, a physician writes—

"Large quantities of salicine, heavily adulterated by mixing with cinchonidia sulph., have been placed upon the market, and I hope that all who see fit to try it as an anti-rheumatic will apply the obvious tests before trying this valuable agent in the crucible of scientific experiment."

Again, on turning to the Chicago *Pharmacist*, Feb. 1879, we find the leading article to be descriptive of an unavailing search for black sulphuret of antimony in Chicago. There are seven wholesale drug houses in that city, and the writer of the article obtained the alleged

sulphuret from each of them, and tested every specimen, with the same results. There was not a trace of antimony in any one of the consignments! In fact, every wholesale drug house in Chicago deals, through ignorance or carelessness, in drugs not only adulterated, but utterly false and worthless. The substance sold as black sulphuret of antimony was generally marble dust, blackened with soot!

With such a disgraceful state of affairs at the commercial headquarters of the Northwest, what may we expect of less important places, with more needy dealers? We may be sure that the sophistication increases and extends, and that most of the drugs sold are inferior in quality, if not wholly false.

These are facts, so well supported with testimony from all directions that it is vain to deny or palliate them. What are the remedies? First, a law passed in the State Legislature, appointing competent analysts, with power to bring action and indict fraudulent dealers; second, that physicians deal only with firms of established repute, who sell under their trade marks drugs guaranteed to be up to the pharmacopœial requirements; third, that physicians acquaint themselves with the chemical tests for purity of most of the drugs they use, and demand of druggists that their articles meet these requirements.

We confess to preferring the last-mentioned of these plans. If the profession would have itself and its patients protected, it should look to itself to do it, rather than to politicians. Certainly the end would be obtained by this plan, and that quickly.

Notes and Comments.

A Plagiarism Discovered.

We have received the following communication from Dr. George J. Ziegler, 249 South Fifteenth street, Philadelphia, in reference to the article by Dr. Worthington Myers, in the Reporter, page 271.

ON "HOPELESS CASES"—SO CALLED.

My attention has been recalled to this subject by one of your contributors presenting as his own part of an editorial thereon written and published by me in the *Medical Cosmos*, January, 1872. Yet, while this plagiarism is discreditable to its author, it is of little moment compared to the vital importance of the successful treatment of apparently incurable but really remediable diseases and disabilities of the living organism. Therefore, to expose this dishonesty, and further urge the practical importance of the most earnest efforts to reach the limits of the possible in the relief of the numerous ills of life, it may be useful for you to republish the entire article.

We have compared the two articles, and find Dr. Myers has copied, word for word, by the page. Even the favorite theory of "unconscious memory" will hardly explain this coincidence. We may at some future time reprint in full Dr. Ziegler's article.

Concealed Hepatic Abscess.

Much was written in American medical journals last year on this topic. Recently, at the London Pathological Society, Dr. N. Moore showed three specimens. The first was taken from a woman who had suffered from chronic dysentery for four years. After death, ulceration of the cæcum was found. The hepatic abscess was partly in the right and partly in the left lobe, and contained eight ounces of pus. The woman had never been further from London than Ipswich. The second case was met with in a man, aged 21, who had a sinus in the left leg, communicating with a diseased ankle joint. The presence of the abscess was not suspected until after death. Its walls were thick. He had been unable to find a record of any case of so large an abscess as was met with in this instance, as the result of a sinus of this kind. The third case was one of multiple abscess. The portal vein was occluded by pylophlebitis, and in one of the large branches of the vein was a small abscess. The fatal inflammation appeared traceable to disease of the vermiform appendix.

The Solid India-Rubber Bandage.

The use of this bandage in chronic ulcers of the leg should be generally adopted. Mr. J. F. Horne reports to the *British Medical Journal* four successful and eight partially successful cases. He says:—

After the application of the bandage each case soon presents a wonderful change. The indurated edges and unhealthy granulations rapidly break down; the gnawing pain often complained of is much relieved; the pressure of the bandage makes the skin pink and shiny, and filled with a rash like scarlatina; healthy granulations spring up, and the wound in a short time is completely full. But here, in eight cases followed disap-

pointment; they did not heal. In the four successful cases the earliest cured wore the bandage forty-two days.

The treatment by solid elastic bandage is not a novelty, for its principle of action, uniform pressure, is old. The immediate result of its application is certainly most favorable, and each of the eight cases was much improved.

Therapeutical Notes.

COMPRESSION IN ASCITES.

Dr. G. V. Dorsey writes, in the Cincinnati *Lancet and Clinic*:—

"Deeply imbued with the idea of the practical value of all suggestions made by Eberle in the treatment of disease, a feeling common to all his students, I have made use of the flannel bandage, generally soaked in salt water, in great numbers of cases of ascites, and have always found it a valuable adjuvant in the treatment. How much of the benefit was due to the chloride of sodium I shall not undertake to say, but the mechanical pressure was undoubtedly the most important."

BALSAM OF PERU IN WOUNDS.

Dr. Caspari, Dr. Wiss, and other German surgeons, have recently advocated balsam of Peru as the best of all dressings in contused, lacerated and incised wounds, in burns and erosions of the surface.

MEAD IN WASTING DISEASES.

Real mead, made from honey, according to the good old receipt (not the base imitation sold under the name), is an admirable nutritive drink in convalescence and in wasting diseases. The German physicians are beginning to use it largely. Its action is similar to that of kúmyss. Will not some energetic druggist start its manufacture in this country?

ATROPIA IN URTICARIA.

Dr. Schwimmer, of St. Petersburg, has succeeded in rapidly curing severe cases of urticaria by the following:—

℞. Atropiæ sulphatis, 0.008–0.01 Gm.
Aquæ destill.,
Glycerinæ, āā 2.
Pulv. tragacanth, q.s. for 10 pills.

Dose, one or two pills, daily.

Gurjun Oil in Leprosy.

Experiments carefully conducted in India have shown that this alleged valuable discovery is of no more efficiency than any other bland oil, so far as relates to the control of leprosy. It is another instance of the ease with which new remedies obtain a wide reputation without any, or but the slightest, foundation in fact.

Experiments in Metalloscopy.

Dr. Vierordt has been making some experiments on the effect of metals on frogs. The main results arrived at may be stated in a few words. The sensibility to *rubbing* was decidedly increased by the application of the metal, but more in the left than in the right leg. The sensibility to *pressure*, as evidenced by movement, was increased; but here the simultaneous movement of the two legs was far more frequent. Taking into consideration the differences in sensibility which different frogs exhibit, as well as the variations of sensibility which occur in the same animal, even during the time of the experiment, there can be scarcely a doubt that the application of a metal produces a positive effect.

Syphilitic Consumption.

Prof. Schnitzter, of Vienna, in the *Wiener Med. Presse*, has called attention to the much greater frequency of this disease than has been hitherto supposed. The symptoms strictly follow those of ordinary tuberculosis, and the diagnosis is often far from easy. The existence of syphilitic symptoms in any other organ or part in a consumptive should at once lead to the suspicion that the phthisis is of like origin; so also, should the confession of previous venereal infection. The recognition of the character of the disease is all important, as specific treatment in the earlier stages will generally effect a prompt cure.

Correspondence.

Notes of a Case of Confinement.

Ed. Med. and Surg. Reporter:—

On the morning of December 23d, 1877, I was called upon to visit Mrs. D., residing in the city, who was supposed to be in labor. She was a primipara. On arriving, at three o'clock P.M., I ascertained that the membranes had ruptured, and the liquor amnii discharged, early in the night. The os was scarcely dilated at all, and not easily dilatable. I found a head presentation; preparatory pains very regular and sufficiently frequent. On passing my hand over the abdomen, the delineations of the uterus could easily be made, extending well up toward the diaphragm, but during neither the interval of rest nor existence of pain did the size of the uterus or protrusion of the abdomen appear, from external manipulation, to be sufficient to contain more than a four months' fœtus. In the course of two hours pains became expulsive in character; the os dilated sufficiently, so that I found that I had the first obstetric position to deal with. The cranium of the child appeared

of ordinary size, fully developed, and as unyielding as we usually find them. Very heavy pains forced the head partially into the superior strait; but as soon as pain subsided the head was as easily movable from one position to another as a prolapsed, pendulous uterus. During the severest contractions the abdomen of the mother, over the region of the womb, did not appear to undergo the slightest change in form, but remained in as perfect symmetry as in the unimpregnated state. On further inquiry she stated that she had no means of knowing how far advanced she was, except by the cessation of the menses, which occurred nine months since. She thought the menses had ceased from taking cold, until she felt the motion, but she continued unchanged in size up to the time of confinement. Had never changed the pattern of her wearing apparel. Had been on the street two days previous, and her condition was not suspected by her most intimate acquaintances. Her wedding dress, that had been made to fit but eleven months before, fit equally as well up to the time of her confinement. She had not laced, as some women do while in this state. I had been well acquainted with her for several years, and knowing her to be under the medium height, and rather spare made, I felt rather curious to know why there was not a change in her general form, and since the birth of the child, a male, of eight and one-half pounds in weight, I still feel a greater curiosity in the premises.

As I stated above, pains did not have the desired effect in expelling the child. The antero-posterior diameter of the pelvis was near the average, but the transverse diameter was exceedingly contracted. The head did not become impacted, but remained movable with but little trouble. I performed as much flexion as was possible, and administered three doses of ergot fl. ext. at intervals, hoping to meet with success, but neither time, manipulation nor medicine had the slightest beneficial effect. After waiting all day, at 8 o'clock P.M. I sent for my obstetric forceps, and by applying all the manual force that I could possibly command, after three repeated pulls, with both hands, during the same number of powerful contractions of the uterus, I was relieved by the exit of a large, well formed head. I then laid the forceps aside, and with a great deal of difficulty, during the succeeding pain, the shoulders, which had met with resistance from the contracted pelvis, were delivered. At the next pain I had to use all the force, to deliver the hips, that would be, under the most critical circumstances, admissible. The child, when delivered, was lifeless, but by sprinkling cold water in its face, blowing in its mouth, slapping the nates gently, and using artificial respiration, in the course of about five minutes it took an imperfect breath; continuing as before to work with it, it would gasp for breath once in about every half minute, for perhaps fifteen minutes, when respiration became more natural; and after applying the ligature to the cord it was passed over to the nurse. I ordered half a teaspoonful of warm sweet oil given, to remove the mucus from its mouth and throat, which was done as soon as it became strong enough to swallow. In about an hour and a half from the time of birth the child commenced crying vigorously, and kept it up during the remainder of the night.

The placenta, when removed, was of usual size. Flooding commenced, but was checked without difficulty by the administration of ergot and whisky and external manipulations, the uterus contracting firmly, forming a globe but little larger than a man's fist.

The mother's recovery was unusually good. She slept during the night very soundly, without the assistance of medicine, and on waking the following morning she expressed herself as feeling well enough to get up and do a day's work. I called to see her occasionally until she got sitting up, but never found it necessary to administer anything but an occasional cathartic.

The strange feature of this case, to me, is how an eight and a half pound child, and an ordinary sized placenta, with the necessary amount of fluids, could be ensconced in the womb of a small, trim-built woman and not present some external appearance. Had she had spinal curvature, extra large abdomen, or large pelvis by nature, it might be easier accounted for, but she had neither.

When her husband called on me to visit her, and informed me that she was going to be confined, I remarked that I was not aware that she was pregnant. I thought I saw her on the street a day or two before, looking as well as usual. "Yes," said he, "she was on the street yesterday, and I don't know what is the matter with her. It don't look to me like there is anything, but she thinks there is, and wants you to go and find out." I started, with full expectation of finding her colicked, or trying to miscarry with a two or three months' fœtus, but was wonderfully surprised to find her as above stated.

There was nothing of any particular moment in the delivery by forceps, but the interesting feature was the almost total lack of change in the conformation of the mother.

J. Linsey Hill, M.D.

Albany, Oregon, March 25, 1879.

Treatment of Enlarged Glands.

Ed. Med. and Surg. Reporter:—

I noticed an article in the London *Lancet*, January, 1879, highly recommending the use of linimentum ammonia, with small proportions of tincture of opium added, in the treatment of enlarged glands resulting from scarlet fever. The above treatment is stated to be recently adopted. I may here add that I have relied solely upon the application of the linimentum ammonia for the treatment of the affection above described for the past two years, have used it in many cases, and in none where a timely and thorough application was made did any suppuration follow. In severe cases I frequently direct a little fresh lard or sweet oil to be applied, so that the skin will tolerate the more frequent application of the liniment. As a local application in enlarged glands, I have had more satisfactory results from the use of liniment of ammonia, or a very strong solution of hydrochlorate of ammonia, than any other local application, iodine not excepted.

Marshalltown, Pa. C. L. Getz, M.D.

Case of Extra-uterine Pregnancy.

ED. MED. AND SURG. REPORTER:—

Doctor Fundenberg's case of extra-uterine pregnancy induces me to offer the details of a similar case now under observation, not because there is anything unusual to report, but to indicate the embarrassment the condition occasions in country practice.

The question of operative interference is not a practical one in the case about to be detailed, owing to duration and variety, it being probably abdominal. Mrs. B., a young married woman, believed herself to be pregnant for the first time, in the early part of last year, and looked forward to confinement in May.

The course of her pregnancy was marked by attacks of acute abdominal pain, with some fever and anasarca. That the condition was pregnancy, there were the following confirmatory signs: Suspension of catamenia, enlargement of abdomen, of breasts, and fetal movements.

Uterine pain came on at what was supposed to be full term, followed by a protrusion from the vulva, which the attending physician, a busy practitioner, pronounced to be prolapse of uterus. In eight or ten days this extrusion separated by sloughing. The patient was also seen at this time by a doctor from a distance, as the delay in parturition alarmed the family. It was concluded that the reckoning was at fault, and that time must be given. I was called upon to make a diagnosis in November, six months after the spurious labor, and learned the foregoing history. Having chloroformed the patient, with the assistance of Dr. Schermerhorn, and noted the size of the abdomen, I examined per vagina, and found the pelvic roof occupied by a firm mass in which the uterine body seemed to be merged. The cervix pointed toward the coccyx. With the view of excluding missed labor, I dilated the cervical canal and found the uterine body unoccupied, the probe passing toward the symphisis pubis. An effort to pass the probe without dilatation failed, possibly from want of skill in the use of the instrument.

A sharp attack of localized peritonitis followed the manipulations, from which the patient happily recovered. The diagnosis was confirmed by the elder Dr. West, whom many of the Iowa readers of the REPORTER will recognize as an enterprising and tireless practitioner.

CHAS. ENFIELD, M.D.

Jefferson, Ia., March 31st.

Fatal Poisoning from Veratrum Viride.

ED. MED. AND SURG. REPORTER:—

A fatal case of poisoning from veratrum viride occurred in Philadelphia Nov. 5th, 1872. A gentleman, aged about 30 years, went into a drug store which he was in the habit of frequenting, and helped himself to what he supposed was a *drink* of whisky. It proved to be veratrum viride, and it killed him in about four hours after taking the noxious dose. R. M. KIRK, M.D.

New Brunswick, N. J., April 14th, 1879.

[It is singular that this case escaped the knowledge of Profs. Stillé and Maisch. We should like further particulars, as we can find no record of it.—ED. REPORTER.]

NEWS AND MISCELLANY.

National Board of Health.

The Secretary informs us that the National Board of Health will convene in special session at Atlanta, Georgia, on the 5th of May prox., and continue in session contemporaneously with the American Medical Association, which meets in regular session at the same place on the 6th of May. The importance of an early interchange of views and the absolute necessity for consultation with health officers, quarantine physicians, and sanitarians generally throughout the United States, has led the National Board of Health to make known its contemplated meeting at Atlanta, and urge upon all persons interested in matters of sanitation, whether municipal, State, or National, to be present and counsel with the Board. It is earnestly hoped that not only every State, but that every municipality in the whole country will be represented, in order that a step may be taken toward securing a general system of health and quarantine regulations, and that by such a gathering of the prominent sanitarians of the United States the interests of all sections may be promoted.

Progress of Epidemics.

The "Bulletin of Public Health" issued by the Surgeon General U. S. Marine Hospital Service this week reports that one new case of plague, not fatal, has been reported on the lower Volga, but there was no extension of the disease. The district still remains under martial law, and a permanent sanitary service is to be organized by the government, with special commissioners, for the inspection of the fishing places, who will have power to destroy the decayed fish liable to accumulate, and to disinfect the vessels and utensils employed. If a fresh outbreak of the disease should occur, the people will be removed from their houses to tents, where separation of the sexes will be maintained.

The quarantines established by the European governments are being generally modified so far as to apply only to persons and goods coming from the immediate vicinity of the infected district.

Typhus fever prevails extensively around the borders of the Black Sea and the Levant, and in the interior of Russia, especially in the province of Viatka, where it was introduced by Turkish prisoners, and disseminated by the movements of the peasantry, and of traveling mendicants. The principal means of propagation was by infected clothing. In one district, twenty-six villages, within a circle of a few miles, suffered severely, the mortality amounting to nearly fifty per cent. of the sick. More females suffered from the disease than males, on account, probably, of being more exposed to the vitiated air of the confined houses, and to the local unsanitary conditions, the men being engaged in out-door occupations elsewhere. Scarlet fever, smallpox, and diphtheria prevailed in the same districts, and the

latter disease caused an excessive mortality, especially among children, in various parts of the empire during the past year. In many districts, from ten to twenty per cent. of the inhabitants suffered from the affection, and nearly fifty per cent. of those attacked died. In small hamlets, with a population of less than one thousand, the deaths numbered from fifty to one hundred. The disease increased in virulence as it spread from one village to another, and its extension was undoubtedly influenced by the bad sanitary conditions of the populace and the scarcity of physicians which prevail in all the rural districts of Russia. Measures have been taken by the government to check the spread of the disease by the appointment of sanitary commissioners and of additional physicians, and by the general disinfection of the inhabitants and isolation of the sick in the infected districts.

The Board of Health Resolutions.

The following resolutions have been passed by the Philadelphia Board of Health:—

Resolved, That hereafter, when death has resulted from a contagious disease, the Board of Health require that the cause shall be mentioned in the published death notice.

Resolved, That the public should avoid unnecessary attendance upon the funerals of those dead from contagious diseases.

Resolved, That among the diseases especially calling for this caution are, scarlet fever, measles, whooping cough, diphtheria, and smallpox or varioloid.

Resolved, That wherever possible, air-tight burial cases be used, and if such cannot be obtained, the funeral be strictly private.

North Carolina State Board of Health.

By an act ratified last month the General Assembly of North Carolina created a State Board of Health. The act provides that the Medical Society of North Carolina shall choose from its active members, by ballot, six members, and the Governor shall appoint three other persons (one of whom shall be a civil engineer) and these shall constitute the North Carolina Board of Health.

Personal.

—Dr. W. L. Darlington has removed to 146 North 20th St.

—Dr. Robert J. Hess, Assistant Physician of Dr. Kirkbride's Pennsylvania Hospital for the Insane, has been elected Resident Physician of the Northern Dispensary, to fill the vacancy caused by the resignation of Dr. Charles Carter. Dr. Carter will take charge of the laboratory of Carter Brothers, manufacturing pharmacists.

—Dr. H. O. Marcy, Cambridge, Mass., is collecting information to prove more clearly the practicability and value (if such it possesses) of aspiration in effusions into joints, especially in synovitis of the knee joint. He will send a circular with a series of inquiries to any one who has had experience on this subject.

Corrections.

On p. 225, col. 2, line 16, instead of "two" read "ten."

Dr. W. Wylie sends us the following modifications to his article, on page 250: 1. The olecranon process rests on the humerus half an inch above the external condyle, instead of "about two inches." 2. The extremity is only 1½ inches shorter than the other, when measured properly.

Apollinaris Water.

The favor with which natural mineral waters are accepted as articles of diet is based not only upon the sort of universal experience which justly counts so much, but also upon direct experiment. Sir Henry Thompson, among others, has, in his well-known lectures, very clearly shown that the effect upon the human constitution, of mineral waters compounded with great exactness in imitation of the natural product of the spring falls far short of, and is, in fact, altogether different from, the effect of those waters which issue from the laboratory of nature. The favor with which Apollinaris natural mineral water has been received by the medical profession and the public in both hemispheres, is no doubt due, therefore, to the personal experience of those who have shown for it so decided a preference, as well as to the high testimonials which it brings from the greatest physicians in Europe and the leading medical men throughout the United States. Hence some considerable disappointment, if not loss of confidence, would have been felt if it had turned out to be true, as has lately been very prominently advertised by trade opponents, that the Apollinaris water is not really the natural water of the Apollinaris spring, but an artificial product impregnated with artificial gas. Mr. Wanklyn, the author of the now most universally adopted methods of water analysis; Prof. Liebreich, the well-known pharmacological chemist and discoverer of chloral; Prof. Sonnenschein, and others, had already certified in favor of the claim of Apollinaris water to its title of natural mineral water. The positive statements, however, recently put forward to the contrary have induced the Apollinaris Company to solicit reports based on new investigations made on the spot by persons of such undoubted official and scientific eminence and responsibility as to place the matter beyond all question. Hoffmann, of Berlin, Odling, of Oxford, Kekulé, of Heidelberg, and Frankland, of the Royal College of Chemistry, of London, have acceded to the request, and their report of the investigation of the wells, the method of bottling, and the water bottled, are before us. They entirely decide the matter, inasmuch as they prove that no other water whatever is bottled than the natural water of the spring, that no other gas is contained in the water than that with which it is naturally impregnated in the spring, and that the water and gas so bottled are drawn from the spring at a depth of fifty feet below the surface.

—The annual meeting of the Mutual Aid Association of the Philadelphia County Medical Society will be held in the hall of the Society, on Monday evening, May 5th, at 8 o'clock.

Dr. Isaac Hays.

At a meeting of the College of Physicians, held April 15th, to take action with reference to the death of Dr. Isaac Hays, resolutions of respect were unanimously adopted:—

Resolved, That the Fellows of the College deeply regret the death of their late able and distinguished associate, Dr. Isaac Hays.

Resolved, That he has largely contributed, by his long and able editorship of the *American Journal of the Medical Sciences*, and by his other valuable works, to the creation and diffusion of a sound and healthful medical literature; and thus made himself, in an enviable degree, an instructor and benefactor of his profession.

Resolved, That by his faithful services of twenty years in connection with Wills Hospital, and by his various publications on ophthalmic surgery, he gave a wholesome impulse and direction to that department, and won for himself a distinguished place among the oculists of the country.

Resolved, That the Fellows, appreciating his learning and his worth, and grateful for services cheerfully rendered during his long and pleasant association with them, will ever cherish a kind and affectionate regard for his memory.

In moving the adoption of the resolutions, Dr. Samuel A. Gross made some remarks eulogistic of Dr. Hays, speaking of the *American Journal of the Medical Sciences*, of which he had been for so many years the editor, as a monument of his industry and learning, no word in which was unworthy of the highest conception of the functions of the editorial chair.

OBITUARY NOTICES.

Charles F. Deshler, M.D.

Died, at his residence in Hightstown, N. J., of scarlet fever, on Monday, March 24th, Dr. Charles Francis Deshler, in his thirty-sixth year.

Dr. Deshler was born in the county of Northampton, Pennsylvania, on the 21st of October, 1843. His father, brothers and sisters are still living, at Allentown, Pa. The record of his early life is not before us, but we know that his education for his profession was begun at Lafayette College, and completed at the University of Pennsylvania, including also a course of study with Dr. Traill Green, of Easton, Pa. His patriotic spirit led him into the Union army, in which he enlisted as a private, but afterward received a commission as Assistant Surgeon, and served in that capacity until peace was declared. At the close of the war he began the practice of his profession at Perrineville, but in a few years removed to Hightstown, where he has since resided. In the County and State Medical Societies, in the New Jersey Sanitary Association, in the hospitals of Philadelphia, he had come to be known as a true student and an able practitioner, and his life work will be summed up by his brethren. In the community where he lived his death was esteemed a public loss.

Dr. Charles L. Ives.

The death of this talented member of the profession occurred, from rectal epithelioma, last month, in Burlington, N. J., where he was temporarily residing. He was a graduate of Yale College in 1852, and of the Jefferson Medical College in 1854. He practiced in New Haven, Conn., where he was born, until 1868, when he was called to the Chair of Diseases of the Mind and Nervous System in the University of New York. Ill health prevented him from filling this appointment, and after various long and painful attacks of illness, he finally succumbed to the disease stated, in the 48th year of his age.

John J. Wilson, M.D.,

Died at Bethlehem, Pa., April 2d 1879, of spinal meningitis. He was born at Allentown, Pa., January 29th, 1821, and received his diploma from the University of Pennsylvania.

Early in life, accompanied by his twin brother, Wm. R. Wilson, he went to Salisbury, N. C., where he practiced his profession with great distinction and success for a period of twenty years.

He was a man of extraordinary ability, and an experienced and skillful physician and surgeon. He was enthusiastically devoted to his profession, and in his death the community loses one of the most eminent and conscientious physicians. Socially he was distinguished for his gentlemanly bearing, his great sense of honor, his virtue, and his thorough integrity.

QUERIES AND REPLIES.

Mrs. E. H. O., of Iowa.—Chronic urticaria is an exceedingly difficult disease to treat with success. The suggestions in Duhring on "Skin Diseases" are the best we now recall. Diet and general rules are of more avail than medicines.

Dr. M. A. W., of Pa., asks what authority we have for asserting that scarlatina and scarlet fever are syonyms. Dunglison's Dictionary is as good as any, and sufficient on such a point. The distinction sometimes drawn between the words is both erroneous and pernicious, as it leads to the disregard of precautions.

Dr. W. D. C., of Ga.—The most satisfactory vaginal syringe we know is that called the "Fountain Syringe," which acts solely by the force of gravity.

Dr. W. H. D., of Iowa.—The prescription on page 259 should probably read, "Glycerine, 10.0;" though we have not the original to refer to.

Dr. C. F. McB., of Pa., asks what is the most efficacious blistering fluid. For general purposes we believe the *collodium cum cantharide*, U. S., is as useful as any.

Dr. T. T. T. of Ohio, writes, "Will you, or any of your numerous readers, inform me of a remedy to stop the growth of the beard? I have a lady patient with a strong growth of hair on her chin.

Ans.—Electrolysis is the most certain and efficient means. See page 367.

MARRIAGES.

WALKER—BIGELOW.—At Malden-on-the-Hudson, April 2d, by the Rev. N. F. Nickerson, Edward F. Walker, M.D., of Providence, R. I., and Catherine B., daughter of Edward Bigelow, Esq.

ZINKE—VON SEGGERN.—In Cincinnati, O., on Wednesday evening, March 26th, 1879, at the residence of the bride's parents, Dr. E. G. Zinke and Miss Clara Von Seggern.

DEATHS.

HAMILTON.—In New York, April 7th, James H. Hamilton, M.D., aged 37 years.

SCHLOENDORN.—In this city, on the 7th instant, of apoplexy, Dr. G. H. A. Schloendorn, in the 58th year of his age.

SEWARD.—At Los Angelos, Cal., on Friday, March 28th, Charles Kirkland Seward, M.D., son of Alexander Seward, of Utica, N. Y., in the 25th year of his age.

SYRUP-GLYCEROLE
OF
FERROUS CHLORIDE.

The Combination which all Forms of Iron must assume before Assimilation.

Superior to all other Iron Salts in that, while it is readily taken into the circulation, and does referruginate the blood, it does not ordinarily cause constipation nor headache. It is very pleasant to the taste, and is unalterable.

Ferrous Chloride is a neutral salt, consequently it has no action upon the teeth, and may be administered fearlessly. This fact and the delightful taste of my preparation render it an advantageous form for administration to children. Each fluid drachm contains one grain of Ferrous Chloride, which, owing to the certainty of its assimilation, is a full, active, adult dose.

McKELWAY, APOTHECARY,

Successor to O. S. HUBBELL.

1410 CHESTNUT ST., PHILADELPHIA

WYETH'S COMPRESSED TABLETS
OF
CHLORATE OF POTASH.

For Hoarseness, Bronchial Irritation, Sore Throat, Diphtheria, Croup, etc., etc.

Chlorate of Potash is a remedy of acknowledged value in cases of Diphtheritic Sore Throat, and in Inflammation of the Mouth and Throat, induced by a depressed state of the system. In these instances, as in the milder forms of Croup, it has, besides its depurative and detergent effects, a solvent action on the deposits, characteristic of those troublesome and dangerous affections. It relieves Hoarseness; and in many cases of Fetid Breath from disordered secretions it proves an efficient corrective. Its virtues in simple Angina, or ordinary Sore Throat, are recognized by many of the most eminent physicians.

As the taste of this article is not disagreeable, we have prepared it in the form of Compressed Tablets, thus giving the patient the full benefit of its action, undiluted with Sugar, Gum, or other vehicles, which would not only prevent its effects, but which sometimes themselves offend the stomach.

The Lozenges usually contain about twenty-five (25) grains of gum and sugar, with two grains of the Chlorate of Potash, while each of these Tablets contains simply five grains of the Chlorate, all of which, dissolved in the saliva, acts on the affected mucous membranes.

If allowed to dissolve in the mouth, the topical effect is much more efficient than a saturated solution, as, while the solution is but temporary, the tablet really acts as a continuous gargle.

FOR SORE THROAT, HOARSENESS.

DIRECTIONS:—Adults should take one every hour or two until relieved, allowing it to dissolve slowly in the Mouth. Children half of one as often.

For Offensive Breath, no remedy will give more certain relief; use one, two or three times a day.

For Diphtheria, Croup and the more serious ailments, the physician should direct.

PEPTONIC PILLS.

Pepsin, Pancreatin with Lacto-Phosphate of Lime and Lactic Acid.

(COPYRIGHT SECURED.)

This pill will give immediate relief in many forms of Dyspepsia and Indigestion, and will prove of permanent benefit in all cases of enfeebled digestion, produced from want of proper secretion of the Gastric Juice. By supplementing the action of the stomach, and rendering the food capable of assimilation, they enable the organ to recover its healthy tone, and thus permanent relief is afforded. One great advantage of the mode of preparation of these pills is the absence of sugar, which is present in all the ordinary Pepsin and Pancreatic compounds. In this form, the dose is much smaller, more pleasant to take, and is less apt to offend the already weak and irritable stomach. The results of their use have been so absolutely satisfactory, that we are confident further trial will secure for them the cordial approval of the Medical Profession and the favor of the general public.

Each pill contains one grain of pure PANCREATIN, which is equivalent to 10 grains of the ordinary or Saccharated usually prescribed and dispensed. Physicians will appreciate the great advantage of this mode of administration, the increased benefit to the dyspeptic being due to a full and effective dose of each, freed from unnecessary bulk, and really hurtful addition of sugar. A single pill will give immediate relief.

DIRECTIONS:—Take one pill immediately after eating or when suffering from Indigestion, Lump in the Throat or Flatulence. For children, reduce the pill to powder and give one-fourth or half, according to age.

Lectures on Experimental Physiology.

Delivered in the Physiological Laboratory of the University of Pennsylvania,

by Robert Meade Smith, M.D.,

Demonstrator of Experimental Physiology.

Reported for the Medical and Surgical Reporter.

(*Continued from page* 315.)

Lecture IV.—Gastric Digestion.

Gentlemen:—The study of gastric digestion, which we take up to-day, is more especially a study of chemical changes. We saw that in the mouth the food was not only subjected to the chemical changes of the saliva, but that through the mechanical changes resulting from mastication and its close combination with the saliva, the materials destined to nourish the body were brought into the most favorable conditions for subjection to the various solvent juices of the economy. The first of these which we will examine is found in the gastric juice.

In following a strict anatomical progression of the food after leaving the mouth, we should naturally study the functions of the pharynx and œsophagus, but since no changes that we are aware of occur in the food in these localities, and as experiments on deglutition cannot be made on narcotized animals, we must omit them, as other more important subjects await our attention. For the same reason no experiments will be made upon the mechanism of vomiting. There is, however, one interesting experiment on deglutition that I will show you. You know that the inferior portions of the œsophagus are supplied by branches from the pneumogastric nerves. When these nerves are divided in the neck a peculiar train of symptoms usually manifest themselves. In the first place, after this operation animals are usually averse to taking food, even though they have been fasting for some time, from which it was originally concluded that section of these nerves abolished the sensation of hunger. When, however, animals in this condition can be prevailed upon to take food, symptoms of suffocation soon supervene, followed generally by the regurgitation of the food just taken. This is not a true vomiting of the contents of the stomach, for none of the food which has been swallowed has entered that organ. The œsophageal orifice of the stomach is found to be tightly contracted, and the food collects in the distended œsophagus, until the orifice of the larynx is occluded, when, of course, fits of suffocation occur. Usually, if the animal does not die in the interval, this condition passes off at the end of two or three days. I will divide the pneumogastrics in the neck of this rabbit, which has fasted for the last two days, and if we can persuade it to take food, we will see these conditions that I have just described. To find the pneumogastric trunks, the animal being fastened on Czermak's holder, and anæsthetized, the fur is clipped off the front of the neck, and an incision, about half an inch in length, made over the inner border of each sterno-mastoid muscle. A pair of blunt hooks is used to loosen the connective tissue, and the border of the sterno-mastoid pulled from the median line. Lying underneath this muscle, surrounded by connective tissue, is seen the carotid artery, and in its sheath three nerves, the vagus, the sympathetic and the depressor.

The vagus is the largest and most prominent, lies to the outside, and is of a striking white hue; the sympathetic is smaller, more transparent, and grayish in color; while the depressor is a very minute nerve, which is not found usually without some difficulty, and is not apt to be mistaken for the vagus. These nerves are to be gently isolated by blunt hooks, and a thread passed under each vagus, which can then be divided with scissors. We will allow the animal to recover from the chloroform, and then try to make it eat. Fortunately for our experiment, it eats the cabbage which we have given it with great voracity, and in a few moments symptoms of suffocation appear; it, however, recovers, goes on eating, and is again choked. I will now kill it by puncturing the medulla, which destroys it instantly, and open its body. The œsophagus is filled, from the stomach to the pharynx, with unaltered food. The stomach also contains some vestiges of food, but you know that in rodents, even when starved to death, the stomach is never found empty.

In our experiments on the saliva we established the precedent of performing acts of digestion, or at least acts introductory to digestion, outside of the body, the natural conditions being preserved as far as possible. In our studies of gastric digestion we will find that this step was not unwarranted. All the phenomena of gastric digestion can be as completely and more conveniently studied in an artificial stomach as in the living organ—a fact demonstrative of the essentially chemical nature of the process. To obtain the gastric juice for these experiments, an operation, the formation of a gastric fistula, is necessary. With a fistula we can not only obtain gastric juice in a state of purity, but can observe the process and conditions of its secretion. By means of a fistula we can also introduce various substances directly into the stomach, without their becoming mingled with saliva, and study step by step the changes in their character; the time necessary for their digestion; the movements and temperature of the stomach, and, in fact, all the manifold phenomena of gastric digestion.

I will now perform this operation of making a gastric fistula before you, in the manner perfected by Bernard. The question first arises, what animal shall it be made upon? We must select an animal in whom the stomach is large and easily dilated, and at the same time lies close to the abdominal walls. For this reason the horse is inappropriate, though excellent, when attainable, for salivary fistulæ, since in them the stomach is small, deeply seated, and of slight functional importance; on the other hand, rabbits cannot be employed, since their stomachs are never empty, and cats are very liable to die of peritonitis, to say nothing of the difficulty in their subsequent management. In some birds with a muscular stomach, as, for example, in a crow, they can be very satisfactorily made. The animal, however, which is, on all accounts, most suitable, is the dog. Dogs are easily managed, secrete pure gastric juice in abundant quantities, and are not very liable to peritonitis. I will, therefore, perform the operation on this dog which has just been brought in, already chloroformed, and secured in Bernard's holder. The first step is to shave the hair from the abdominal wall, in the epigastric region, and remove *all* the hairs carefully with a sponge, so as to prevent their entering the abdominal cavity. An incision is then made through the skin, commencing at the lower margin of the costal cartilage, and about an inch and a half to the left of the linea alba, and extending downward parallel to this line, for a distance a little less than the diameter of the flange of the canula which it is desired to use. Each muscular layer is then to be divided, in a direction parallel to its fibres, every bleeding point being tied before the peritoneum is opened, so as to prevent the entrance of blood into its cavity. When it is certain that all the bleeding has stopped, the peritoneum is to be opened on a director. On stretching open the wound, the stomach (which should have been distended before the operation, by a full meal, or by inflation with air, by means of a tube passed down the œsophagus) comes into view, its oblique muscular structure being plainly visible through its serous covering. A point of the gastric wall should now be seized with artery forceps at a spot where there are not many vessels, and drawn forward. Two strong silk threads are then passed into the walls of the stomach with a curved needle, at a distance from each other about equal to the diameter of the tube of the canula, and brought out again at a similar distance from the points where they were introduced. I will now make an incision into the gastric walls between the two threads, rather shorter than the diameter of the tube of the canula; immediately some bubbles of gas escape, and some of the fluid contents of the stomach, which must be sponged off. The opening into the stomach is now to be stretched with a pair of blunt hooks, until it is large enough to pass the inner flange of the canula, which is to be then introduced and pushed into the stomach up to its outer plate. I will now tie

the stomach to the canula by the threads which have been introduced, and then pass their ends through the abdominal wall in such a way as to fasten the stomach to it, and at the same time, when again tied together, keep the edges of the wound in the abdominal walls in apposition. This suture need not be carried through the peritoneum, and no additional means of closing the wound is necessary. The operation is now finished, and the animal may be allowed to come up from the chloroform. The canula must be left uncorked for at least half an hour after the operation, for the dog is almost certain to vomit, and otherwise the contents of the stomach would be apt to be forced past the side of the canula into the abdominal cavity, and cause the certain death of the animal.

The animal must be fed on milk for two or three days after the operation, and kept in a warm place. While recovering from the anæsthetic, the animal will very likely make attempts to tear out the canula with his teeth, a result which would be very apt to be fatal, though the dog which I will show you in a few moments tore out the canula four times after the operation, and I was compelled to re-insert it each time, without, however, any bad results to the dog. The only way this accident can be guarded against is by careful watching. It will not do to muzzle him and leave him, for if he then should vomit he will choke to death.

After the first day the wound becomes so tender that no further attempts at tearing out the canula are usually made. The form of canula almost universally used is that designed by Bernard. It consists of two silver or nickel-plated tubes, each of which has at one end a broad flange; one tube screws into the other, so that the distance between the two flanges can be altered at will. On the second or third day after the operation the margin of the wound becomes very much swollen; this arrangement of the tubes permits the lengthening of the canula so that the skin is not ulcerated from pressure of the flange. The canula may be closed by a cork soaked in a decoction of colocynth, to prevent the dog tearing it out with his teeth, or with a valve such as this one. If everything goes well this dog that we have just operated on will be ready for experiment in about a week. In the one that I now show you I operated about six weeks ago, and although, as I told you, he tore the canula out four times, thus necessitating four operations, the wound is now firmly cicatrized, and the animal is in good health and spirits. In order to collect a pure specimen, the dog has received no food since yesterday; his stomach will, therefore, be empty. I have used him so often to obtain gastric juice that he has now learned perfectly what is expected of him, and he will jump on the table when I call him, and stand perfectly motionless until I have finished with him. I will open the valve and tickle the inner surface of the stomach with a feather tied to a glass rod, and the gastric juice flows along the rod, drop by drop, into the glass beaker. Bernard's method of stimulating the flow of gastric juice was to give a dog which had been fasting for some time, a hearty meal of thoroughly boiled tripe, which furnished a normal stimulus to the gastric glands, and being quite indigestible, does not contaminate the gastric juice with peptone for some time. It is undoubtedly preferable to mechanical stimulation, on some accounts. Gastric juice is thin, almost colorless, and slightly opalescent. When tested with litmus paper, it gives a decidedly acid reaction; its specific gravity is about 1.010. The most prominent feature of its chemical composition is its excess of free acid, the nature of which, however, is still a subject of controversy, though the majority of observers testify to the presence of large amounts of lactic acid, while there is considerable doubt as to whether hydrochloric, which is also claimed to exist, is not formed in the process of examination, from the decomposition of the chloride.

The important organic constituent of the gastric juice is termed pepsin. It is obtained by a process analogous to that which we employed in separating ptyaline from the salivary glands. The stomach is removed from a recently killed animal (pig, rabbit, dog, etc.), its contents removed, and its mucous surface washed with a gentle stream of water. The pyloric end is then cut off, and the remainder stretched out flat on a board, and the mucous membrane carefully dissected off from the underlying muscular layers.

The mucous membrane is then minced into small pieces, placed in absolute alcohol for twenty-four hours, to precipitate the pepsine in the gland tissue. After filtering off the alcohol and drying the pieces with filtering paper, they are to be removed to glycerine, and allowed to stand for several days. The glycerine can then be filtered off, first through muslin and then paper, and pepsin precipitated as a fine flocculent precipitate from the filtrate by the addition of a large excess of absolute alcohol. The alcohol is again to be filtered off, and the pepsin remaining on the filter may be dissolved by two per cent. muriatic acid. To obtain acid of this

strength, since the ordinary strong muriatic acid, specific gravity 1.16, contains 31.8 per cent. by weight of the gas H Cl., 6.25 cc. of this acid is to be mixed with enough distilled water to make one litre, so giving an acid which contains two per cent of H Cl. gas, an acid about the strength of the gastric juice.

Let us now examine a few of the reactions of pepsin in the solution thus obtained. In the first place, we must test its purity, to see that we have no proteid results of gastric digestion mixed with our solution. It does not respond to the xanthoproteic reaction, thus showing the absence of albuminoids. I will now add a little concentrated nitric acid. No precipitate. A little tannic acid, iodine, mercuric chloride, with the same result, there is no precipitate. It is precipitated, however, as you see, by a solution of acetate of lead, and also by platinum chloride. I have here four or five specimens, obtained from different sources, of what is known in commerce as pepsine; though, as you see, from the tests, none are pure, while they have little if any digestive value.

The characteristic test of the presence of this ferment is known as the *pepsin test* with fibrine. I have here a little fibrine which was obtained by whipping the blood as it flowed from a divided vessel; it was then washed until perfectly white and preserved under glycerine, from which it must be cleansed for use by washing. Two hours ago I placed a small piece in this test tube, with a little gastric juice, and placed it in the water bath at 35° C. The fibrine has disappeared, and the fluid is more opalescent than before. There is no precipitate upon boiling, and a very slight one upon neutralization. In this other tube, about a quarter of an hour before the lecture, I placed another fragment of fibrine, with gastric juice, and you see, as a sign of the first stage of digestion, the fibrine is swollen and more transparent than before. Since no other substance will produce these effects with fibrine, they are characteristic of the presence of pepsin with a dilute acid.

You can readily appreciate the importance of this reaction, as, for instance, the power it gives us of locating the situation of peptic digestion in the alimentary canal or tissues of the invertebrates.

This process, with this end in view, has been considerably elaborated by Brücke, but for its additional details I must refer you to his original memoir or the abstract published by Brunton in the Handbook of the Physiological Laboratory.

I told you a few minutes ago that all the phenomena of gastric digestion could be more conveniently studied outside of the body, and I should have added, with an artificial juice. In the first place, it is evident that only a limited amount of gastric juice can be obtained from any animal for experimentation, a disadvantage not applicable to an artificial digestive fluid. In the second place, the method of introducing substances (confined in gauze sacs) into a stomach cannot but furnish unreliable results, for, while all the peptones cannot be collected in a state of purity for examination, the diminution of weight of the substance introduced will not even be equivalent to the amount which has been digested, since much that has been merely disintegrated and not digested by the gastric juice, must escape through the meshes of the sac. The method of *infusion*, however, that I will show you directly, is not open to these objections. An artificial gastric juice of considerable purity may be obtained by mincing the mucous membrane of a stomach (of almost any animal) and covering the pieces with strong glycerine. In a few days the glycerine will become strongly impregnated with pepsin, and may be preserved for almost any length of time. The addition of a few drops of this extract to 100 cc. of muriatic acid of 0.2 per cent. will yield a fluid of high digestive power. Here is a specimen I obtained six months ago, and it is still strongly active. An artificial fluid may also be obtained by rubbing up the minced mucous membrane, from which the mucus has been removed by gentle scraping, in a mortar, with clean sand, or powdered glass and water. It should then stand for some hours, being occasionally stirred and finally filtered. The filtrate will contain pepsin and a small amount of peptones; added to an equal bulk of H Cl., 0.2 per cent., it will form a powerful digestive fluid, which can be kept for a long time, not even losing its powers when mouldy. The fact that a digestive fluid can be thus obtained, shows us that pepsine is soluble in water. Let us now examine the digestive action of gastric juice, employing the method of infusion or auto-digestion of the stomach recommended by Schiff. The day before yesterday I tied the portal vein in a dog, and in about an hour and a half it died, under the well known symptoms which follow this lesion, somnolence, coma and progressive insensibility. I then removed the stomach, minced it into small pieces, and infused them in 400 cc. of H Cl., 0.2 per cent., for nine hours in the warm bath at 40° C. At the end of this time the fragments of the stomach were almost entirely liquefied; the

small, pulpy, yellowish residue now in the filter is all that remains undissolved. This method of auto-digestion of the stomach has been selected as apt to give the best general idea of the action of gastric juice.

In the structure of the stomach are found the principal animal substances which serve as nutriment. We find the albumen and fibrine of the blood in increased quantity, since the ligation of the vena porta produced repletion of the gastric vessels, the muscular tissue of the organ and the connective tissue, which, in a slightly modified form, finds its equivalent in gelatine. We are assured of the fact of our having obtained a veritable *solution*, and not a mere *suspension* of the disintegrated stomach, by the fact that all the liquid has passed through the filter, it is clear, uniformly yellowish, and the microscope reveals no solid particle, while the mass on the filter bears a very small proportion to the quantity of solid material in the tissues of the stomach. It is also capable of dialysis. Admitting, then, that the albuminoid materials of the tissues have been dissolved by the gastric fluid, we have now to see in what form they are present in our solution.

You know that albumen is precipitated from its solutions by boiling or by a concentrated mineral acid; in this instance neither boiling nor the addition of nitric acid causes any precipitate. If the albumen is present in our solution, it must be in a modified form. You remember I showed you, when considering the composition of saliva, what is called the xanthoproteic reaction, a test indicative of the presence of an albuminoid. I will boil the specimen to which I added nitric acid, and it becomes strongly yellow; the addition, when cold, of ammonia, will turn the yellow into a bright orange. There is also another test known as Millon's reagent for albuminoids. It is made by digesting equal weights of pure nitric acid and mercury over a sand bath until the mercury is entirely dissolved. It is then added to twice its bulk of cold water, and placed aside for some hours. The white crystalline precipitate which has then settled may be removed by filtration, giving a clear, yellow filtrate, which is Millon's reagent. To another portion of this gastric solution I will add a few drops of Millon's reagent, and boil. There is a yellowish-red precipitate. I will now carefully add, drop by drop, a little liquor potassæ to another specimen, until the fluid is perfectly neutral, and there is now a faint precipitate. I will refer to this, which is parapeptone, again. The application of Millon's test to this neutralized specimen, from which the syntonin has been filtered off, now causes a white precipitate, and on boiling it becomes a rosy pink. These tests show that albumen does not exist in its usual form in this fluid; it has not been destroyed by the gastric juice, but merely transformed, still answering to the reactions of the proteid group.

Remembering, then, these facts for future comparison, viz., that the gastric juice, after death, will convert the albuminoid material of the stomach into a modified form of the proteid group, let us examine a little more closely, with an artificial fluid, the conditions which modify this transformation, and the characters of the products thereby produced. In the first place, you know that when albumen is subjected for some time to the action of a dilute acid, it is so transformed as not to be precipitated by boiling, while another substance altogether, syntonin, or acid albumen, is formed.

I have prepared a solution of egg albumen, by pouring the whites of two or three raw hen's eggs into a glass beaker, and then cutting them up with a pair of scissors, to liberate the albumen from the meshes of fine membranes which confine it. After stirring vigorously, it was then pressed through muslin and mixed with an equal bulk of water, and allowed to stand for several hours. It was then filtered, and as it very soon chokes up the meshes of the filter paper, it is better to use a number of small filters rather than one large one, changing them as soon as they become clogged. Filtration is also much facilitated by the use of Bunsen's air pump.

Into this beaker I placed, two hours ago, equal bulks of dilute egg albumen thus obtained, and muriatic acid 0.2 per cent. It was then placed in the water bath at 40° C. When first placed in the bath, boiling caused almost complete solidification of the specimen examined, from coagulation of the albumen; now, however, you see that boiling does not even produce turbidity. I will now carefully neutralize a portion of this fluid, by introducing a drop of litmus solution, and then adding, drop by drop, liquor potassæ, until the red litmus becomes violet, and you see there is a decided precipitate. This is acid albumen, syntonin, or parapeptone. I will now filter off this precipitate, and boil the filtrate, which, you remember, is neutral. There is no precipitate; I apply Millon's test; there is no reaction. Not only has all the albumen been converted into syntonin, but there remains in the filtrate no other number of the proteid group. This, then, is an analogue of the precipitate which was obtained upon neutralizing the pro-

ducts of auto-digestion of the stomach, and we now see that it may have been due to the action of the acid on the albumen. Are we to infer from this that the *acid* is the important factor in gastric digestion? I have here four test tubes; in No. I I placed yesterday 5 cc. of muriatic acid 0.2 per cent. 2. In II 5 cc. of artificial gastric juice, made by adding a few drops of glycerine pepsine extract to dilute muriatic acid, as already described; in III 5 cc. of the same juice, carefully neutralized, and in IV 5 cc. of the same juice, thoroughly boiled. Into each I placed a small cube of coagulated white of egg, the same weight being placed in each tube. They were then all placed in the water bath at 40° C. At the same time I also prepared duplicates of No. II. One was surrounded with ice, and the other kept at the temperature of the room. Upon examining them, we see that in I, which contained acid alone, the albumen is unchanged, its corners being as sharp and the fluid as clear as before the experiment. In II, which contained the artificial gastric juice, the albumen has entirely disappeared, with the exception of a very minute portion, while the fluid appears slightly opalescent. In III, which contains gastric juice neutralized, or in other words, pepsine alone, and in IV, which contains gastric juice boiled, there has been no change in the albumen. We learn from this, then, that coagulated albumen is not dissolved by acid alone, or by pepsine alone, but that their combination is necessary for their solution, while we also learn that pepsine is destroyed by heat, and by referring to our other tubes, that cold prevents gastric digestion, the albumen in the tube which was placed in the ice having undergone no solution, while the corners have merely been rounded off the cube of albumen in the digestive fluid which was kept at the temperature of the room. If, however, we place the tube which was in the ice in the warm bath, the albumen will be digested; its solution was merely suspended by cold. It is, however, destroyed by boiling.

I have here an experiment devised by Grünhagen, to show the influence of pepsine on digestion. Before the hour I placed a small quantity of fibrine in H Cl. 0.2 per cent, and you see that although it has not been dissolved, it is swollen to a stiff jelly. I will throw it on a filter moistened with the same muriatic acid, and allow all the acid to drain off. In a few minutes the acid has all filtered away, and the fibrine remains in the filter. I will now pour on the fibrine two or three drops of glycerine pepsine extract, and almost immediately a fluid drops from the funnel. Testing a portion of it with the xanthoproteic test we get the reaction of albuminoid, and on neutralization get a deposit of parapeptone. The fibrine has been digested. You also learn from this that gastric digestion reduces solids to a fluid form, while you saw in the pepsine test that the first sign of digestion of fibrine was its increase of size.

We have seen, then, that a combination of pepsin and acid are necessary for digestion, and I may perhaps mention here that they are pretty generally supposed to unite and form a new compound, pepto-hydrochloric acid. While this idea has not been demonstrated, there are, nevertheless, many points in its favor. We have seen that their combination produces effects which neither are able to produce alone, and in that combination their individual properties are modified. For example, dilute acid extracts all the salts from an albuminous body, leaving a gelatinous residue, while the combination of acid and pepsin dissolves the gelatinous portions, and leaves a residue composed mainly of inorganic salts. Then, again, acid combined with pepsin renders the latter capable of dialysis, a property unpossessed by pepsin alone. Whatever may be the combination, however, pepsin seems to supply the place of prolonged boiling, since results almost identical to those of gastric digestion can be obtained by boiling albuminous materials for a long time in water, or for a less time with dilute acid. The pepsine appears to supply this element of heat and time, and in some manner facilitate the splitting up and hydration of albuminous compounds in an acid fluid.

Pepsine, like other ferments, is not destroyed in the exertion of its function, but, unlike most other ferments, a limited amount of gastric juice will not digest an unlimited amount of albumen. In this test tube I placed, in artificial gastric juice, several days ago, a small piece of fibrine, and when it was dissolved, another piece, and so on, until there was no further solution. The cessation of digestion, however, was not due to the destruction of the pepsine, but to diminution of acidity and to the accumulation of peptones, for when I added the same amount of fibrine to the same amount of gastric juice in a dialyser, the peptones diffused and solution was not checked. Also, by adding water to the tube in which digestion had stopped, the peptones were diluted, and digestion recommenced, though in a feeble degree. The addition of acid under the same circumstances would have still more strongly facilitated solution. This, however, is a condition of affairs which is not apt to occur in

the stomach, for as the peptones are formed they are absorbed in great part by the gastric vessels, and the effect of their accumulation thus prevented.

Hospital Reports.

PENNSYLVANIA HOSPITAL.

SURGICAL CLINIC OF DR. R. J. LEVIS.¶ SERVICE OF 1879.

Reported by N. H. Chapman, M.D.

Two Results of Syphilitic Infection. Destruction of the Tongue, and Stenosis of the Fauces. Operation for Stenosis.

Gentlemen: —I have two very interesting cases of specific disease to show you this morning. They are both exceedingly well marked and characteristic. Indeed, it would be hard to find better illustrations of the extremes of syphilitic ulceration. I bring them in together, that you may not only compare their common features, but contrast their points of dissimilarity as well.

If you will look into the mouth of this middle-aged man, you will notice that the tongue is almost entirely destroyed by ulceration. Only a very small portion of it, upon the right side, far back toward the base, has escaped. The destruction is so extensive that the tongue has been eaten away clear down to its base, and you see very little but the floor of the mouth. The half arches of the palate and the uvula have not been exempt from this destructive ulceration. Considerable portions of them are gone, and the opening into the pharynx is thus rendered very much larger than normal.

All this is in marked contrast to what you will see by looking into the mouth of this boy. Here the opening into the pharynx is very small. It would scarcely admit the point of the little finger. The posterior fauces are so narrowed and constricted by cicatricial tissue as to entirely prevent the boy from taking any solid food, and it is only with difficulty that he can swallow liquids. Respiration is also impaired, and he breathes mostly through his nose, but even in this way it is performed with some difficulty.

In this case, which is the most marked example of stenosis of the fauces that I have ever seen, there is nothing definitely known as to the family history, but the cause is undoubtedly a congenital taint of the system. If you will notice his teeth, it will be seen that they are irregular, pointed, peg-shaped, and in places slightly notched. Though these are not the typical notched teeth described by Mr. Hutchinson, and known as the "Hutchinson teeth," yet they are sufficiently characteristic to indicate the presence of syphilis in its congenital form.

These two cases, then, are due to a similar constitutional infection. In the case of the man, however, it is not congenital, but has been acquired. His case has not yet gone so far as to give that marked constriction of the fauces which is seen in the boy. But in time the cicatricial contraction must be the same, or perhaps, considering the extent of the ulcerated parts, it may even be still more severe. He has been under the ordinary anti-syphilitic plan of treatment (bichloride of mercury and iodide of potassium) for some time, and his condition has improved. The rapid progress of the ulcer has been checked, and the extent of surface involved somewhat diminished; but as the parts go on healing, and cicatricial tissue forms, it is to be expected that more or less contraction will take place.

The boy was sent here about a month ago, with the hope that something might be done for his relief. When he came in I did not feel inclined to perform an operation for his relief until I could carefully study and reflect upon the various points of interest which the case presents. Besides this, the boy's general health was considerably enfeebled, from a condition, most likely, of partial starvation; so we began by giving him tonics and nourishing broths in abundance, to prepare him for whatever operation might ultimately be deemed advisable. A number of different plans of treatment have since been considered in connection with this interesting case, with a great deal of care, and, indeed, it has been a somewhat difficult matter to determine just what mode of procedure would be likely to prove most satisfactory. The indication plainly is to enlarge or make wider this narrow, constricted opening from the buccal cavity into the pharynx, and the only question to be considered is how this enlargement can be best accomplished. The mere widening of the fauces by incision is not a difficult matter. In fact, it would be a very simple operation, but it would be only temporary in its effects, for the parts would soon heal and leave the cicatricial tissue as strong and as compacted as ever. I might cut away part of this dense tissue, removing at the same time some of the soft and perhaps a portion of the hard palate, and by so doing secure a permanent result, but this is a more serious operation than I deem necessary. What I propose doing for this boy's relief is nothing more than a rapid mechanical dilatation or disruption of the narrowed fauces. The object being to forcibly dilate the parts as much as possible at once, and then to carefully repeat the stretching process from time to time. In this way we will not only hold all that is gained by the first operation, but gradually force the tissues to relax and assume a more normal condition.

The means of producing this rapid or forcible dilatation of the fauces are very simple. I have a variety of instruments upon the table which might be used. Any one of them, if properly employed, would doubtless answer the purpose. Here is one, known as "the larynx dilator," which might answer very well. This instrument, as you see, is constructed upon the same principle as the obstetrician's speculum, except that it is provided with three valves or blades, instead of two. The intention in using the dilator being to introduce it closed, and then to expand the blades while it remains in position. Or, instead of this, I may produce the dilatation by expanding the blades of an ordinary pair of large-sized lithotomy or stone forceps. The same effect, however, may be produced by introducing a series of very large, solid bougies, passing one bougie after another through the constricted parts, in rapid succession, until a sufficient amount

of distention is secured. This, I am inclined to believe, is the most advisable plan of treatment to be followed in the case before you.

As soon as he is sufficiently under the influence of the anæsthetic (ether, which is taken with difficulty, on account of the impediment to respiration), I will introduce a number of this series of graduated hard rubber bougies which you notice on the table, and see if the effect we desire cannot be produced without materially injuring the surrounding parts. In pursuance of this plan of treatment, I introduce through the narrowed opening, first, the index finger, which is, to say the least, a very close fit, then the middle finger, then a solid bougie, which is somewhat larger than the finger, then one which is still larger, and yet another of larger size still, are all forced through the constriction.

The opening into the pharynx is by this operation considerably increased in size. It is, probably, increased enough for the present, but in order to retain the degree of dilatation which has thus been gained, it is necessary that the passage of the largest bougie just used should be repeated every few days. If this precaution is neglected, the cicatricial tissue will be very apt to contract down firmly, and give as much trouble as before. The bougie may pass with a little difficulty at first, but after it has been used several times there will be no trouble whatever. The resistance offered by the tissues will gradually lessen, and after a time a larger bougie may be substituted without much difficulty. After using this in a similar manner, it in turn may be superseded by one of still larger size. In this way we may continue to force the parts asunder and give the boy the relief he desires. It will necessarily require a little time and patience to carry out this plan of treatment, but I apprehend that the result will be a permanent one.

Varicocele and its Treatment by Subcutaneous Ligation—Dr. Levis's Operation.

In this robust and apparently healthy young man, twenty-four years of age, I show you what has received the name of varicocele.

Varicocele is a term used to designate an enlargement of the spermatic vessels, or more particularly of the veins within the scrotum. The condition is a very common one. It occurs, to a greater or less extent, in perhaps as many as one out of every nine or ten adult males. It usually makes its appearance between puberty and early adult life; seldom later than this. It is almost a uniformly left-sided affection; in fact, the right spermatic veins are no more liable to become varicose than the superficial veins of the lower extremities or other parts of the body. The reason why the veins of the left side are the ones most frequently enlarged is mainly an anatomical one. The left spermatic enters the renal at right angles, and passes under or behind the sigmoid flexure of the colon; whereas the right enters in an oblique manner directly into the ascending vena cava, and is provided with valves; so that the course of the return blood upon the left side is more tortuous and more difficult than upon the right.

This affection very frequently gives rise to a great deal of mental alarm and anxiety on the part of the patient. It worries him, and is continually upon his mind. It is, therefore, eminently proper to give relief by a safe operation.

There have been a variety of operations proposed by different surgeons for the cure of varicocele. Celsus recommended the use of strong caustics, to obliterate the enlarged veins. Breschet made use of compression with the pincers. Velpeau made a large needle and a figure-of-eight suture embrace the veins, and Sir Astley Cooper removed a portion of the scrotum. Other surgeons have suggested various operations; but I will show you one this morning which I have employed for a long time, and know to be effectual. It consists in ligating the spermatic veins subcutaneously and adjusting the ligature in such a manner that it will gradually cut its way through the vessels by the ulcerative process.

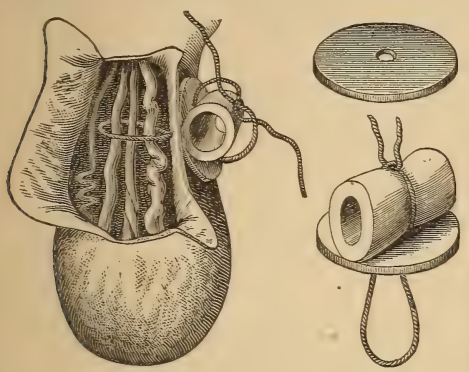
For the success of this operation it is essential that all the enlarged veins should be included in the ligature, and that the vas deferens should be excluded from it. The vas deferens should not, under any circumstances, be ligated with the varicose veins. It must be carefully separated from them and kept out of the way. To do this, push the veins to the outer side of the scrotum, and the deferent tube toward the median line, when the latter will be felt as a round, hard cord, rolling under the finger. If there is any doubt as to whether you really have separated the vas deferens from the enlarged veins or not, just pinch it rather hard, and the peculiar sickening pain that the patient will instantly complain of will tell you whether you are right or wrong.

To perform this operation, you require a long, straight needle, armed with a strong silk cord, a flattened disk, which has a hole pierced through its centre, and a small piece of rubber tubing, or section of gum elastic. The disk may be of any substance which is convenient, as bone, hard rubber, or the like. But a disk which will answer just as well as any of these, can be made by taking a silver quarter of a dollar, or a circular piece of tin, and piercing a hole in its centre large enough to easily admit both strands of the ligature. A silver coin, in which I had previously drilled a hole, is what I employed the first time I performed this operation, and I have no reason to desire anything better.

It is always well to begin this operation with the patient in the erect posture, and finish it with him in the recumbent. The reason of this is, that in examining the parts and transfixing, you want the vessels fully distended, but in tightening up the ligature, no such fullness or distention is required. The tightening of the ligature should be done during anæsthesia, for this part of the operation is painful.

The mode of procedure is to enter the needle on the anterior and outside of the scrotum, near to the top of the mass of varicose veins; then traverse the scrotum completely, so that the needle shall pass behind the veins and make its exit on the opposite side. Then reënter the needle at the orifice of exit, and pass it in front of the veins and bring it out at the original point of entrance. Thus the veins are completely surrounded by the ligature. The ends of the ligature are now passed through the hole in the centre

of the circular, flattened disk, drawn tightly, and tied over the section of rubber tubing. The rubber tubing should be large enough (say a half to three-quarters of an inch in diameter) to allow of a certain amount of springing motion. If no elastic material be used, the ligature would do its work for a short time just after being applied or tightened, and then it would be comparatively



useless until such time as it was tightened again. But if the ligature be drawn down tightly over a section of rubber tubing, the gradual expansion keeps the ligature constantly tense and up to its work. Then, as the ligature remains, and is tightened from time to time, whenever the expansive power of the tubing is exhausted, it gradually cuts the vessels, and so works its way out. Instead of the rubber tubing, a piece of ordinary erasing rubber, bent so as to act as a spring, may be substituted. The process ought to be completed in a week's time, or less. If it is not, it is because the ligature has been neglected, and allowed to remain so lax that it could not do its work. It should be tightened every day, or the result will be needlessly delayed.

I introduced this operation several years ago, and have resorted to it without hesitation, in both hospital and private practice, and have always found it very effectual. It is easy of performance, involves no especial danger, and is an operation upon which reliance may confidently be placed.

Incarcerated Femoral Hernia—Its Partial Reduction by Taxis.

I have a patient, a female, aged about thirty-five years, who this morning walked some distance to the hospital, suffering with an enlargement in the left groin—a hernia. Some exposure being necessary in the examination of this case, I have had the woman etherized before bringing her into your presence, as it is never well to disregard the sensitiveness of any patient.

In giving her history, the woman states that she has had slight hernia for many years, but that the mass has never been so low down nor so large before. On former occasions the tumor has been small, and she has repeatedly been able to reduce its size by her own efforts, but this time the mass has proven itself to be irreducible by the ordinary means which she was able to employ. She also states that the mass has been in its present condition since last Thursday (six days), and that there has been no motion of the bowels since that time.

On examination, I find a tumor in the groin, a little below Poupart's ligament, which has apparently emerged from the saphenous opening. I find that the tumor is hard, and that it is resonant on percussion, thus showing that a portion of the intestine is really contained in the mass, though there is also a considerable amount of dense tissue, and perhaps omentum, which overlies the protruding portion of the gut. There has been no vomiting, either of the contents of the stomach or of the intestinal tube; no pains resembling colic in the umbilical region; and the tumor exhibits no evidence of high inflammation or mortification of the gut. We have, then, simply an incarcerated hernia without strangulation. It is a form of hernia in which the symptoms are not urgent enough to justify an immediate operation, which would not be free from danger, without first employing the simpler means of treatment, which are often effectual. The attempt will be made, then, to accomplish a reduction of the mass by taxis.

In performing these manipulations, a great deal is to be gained by placing the body in a proper position. The hips should be somewhat elevated, and the shoulders rest low, to give the parts the advantage of gravity. The legs should be well drawn up, and the thigh of the affected side adducted and rotated inward, to relax the tissues at the point of constriction as much as possible. The anæsthetic also aids in the relaxation of the parts. The observance of these preliminaries renders reduction by taxis easier and much more certain.

If the taxis is judiciously employed it can seldom be attended with anything except good results; but if it be rude or unskillful, it is sure to increase the danger and exaggerate whatever symptoms may be present. Violent efforts should never be made in endeavoring to return the gut. Good taxis is always moderate and steady. Do not take hold of the mass and attempt to push the intestine right back into the abdominal cavity, or your efforts will but produce a valve-like closure at the seat of stricture. Rather grasp the mass and endeavor to draw it forward, and, if possible, empty the intestine of its contents and the sac of its serum, and then the protrusion may readily be reduced.

The amount of manipulation which any case of hernia will tolerate is exceedingly variable. If there is violent inflammation, and there are strong adhesions between the bowel and proper hernial sac, taxis of any kind is dangerous. If the case be one of incarcerated hernia, with symptoms which are not particularly urgent, like the one before you, the manipulations may safely be somewhat prolonged in character. It is frequently a better plan, however, to repeat the attempts at reduction from time to time, than to make one continued taxis; for in this way a little is gained at each attempt, and by persistent efforts an operation may be ultimately avoided. Should there be gas or fecal matter imprisoned within the bowel, its escape, which will be marked by a peculiar gurgling sound, that is not easily mistaken, may be effected by persistent efforts at reduction.

In this woman there is evidently some gas confined in the protruding portion of the bowel, for my manipulations give rise to this peculiar gurgling sound. The sound is not as distinct here as I have heard it, but is sufficiently so to be recognized. By working carefully and patiently, in the way which I have already indicated, I find that the mass is gradually growing smaller, as, I think you all see, I have really reduced the size of the tumor considerably, and I feel confident that I have succeeded in returning the intestine to its proper cavity. All the parts which originally came down have not yet been returned to the abdomen; some of them still remain in the sac; but the mass is reduced down now until we have nothing remaining in this unnatural site except some old, hard, indurated and thickened tissue, with, perhaps, a portion of the omentum. At some future time we may attempt a further reduction, but for the present we have done enough. The bowel will be prevented from coming down again by the application of an appropriate truss or bandage.

Equino-varus — Operation and a Mode of After Treatment Without the aid of Mechanical Appliances.

I have a case of club-foot, of the variety called equino-varus. It occurs in this boy of about ten years of age, and affects only one side.

You will notice, by comparing one leg with the other, that the left is considerably wasted, and that the ankle appears very much weaker than its fellow of the opposite side. There is also a contraction of the tendo-Achillis, a somewhat palsied condition of the peronei muscles, and tension of the plantar fascia. The ligaments upon the inner aspect of the foot are shortened and somewhat more compact. The bones of the tarsus, and especially the astragalus, have been twisted, or changed in position, so as to give the foot a slightly curved or warped appearance.

The operation usually performed for the correction of this deformity is the division of the tendo-Achillis and of the plantar fascia. In case there is any resistance offered, however, by the long extensor tendon of the great toe, this must also be divided. In this case, the tendon of the extensor proprius pollicis is not unduly contracted. All I shall do, then, is to divide the tendo-Achillis and plantar fascia.

Tenotomy may be performed by a variety of knives, but the one which I prefer is the ordinary round-pointed tenotome. This instrument is all that is necessary. Both the puncture and the division of the tendon can be easily effected with it.

The operation is a simple one, and in performing it, which is done under the influence of an anæsthetic, it is immaterial whether you enter the knife above the tendon, and cut from above downward, or whether you enter the knife below the tendon and cut within outward. I am in the habit of entering the knife below the tendon, and will do so here. With the patient, then, lying upon his belly, and the tendo-Achillis tense, from the forcible flexion of the foot, I easily accomplish complete division by a slight sawing motion of the knife upon the tendon. I divide the plantar fascia in the same way, and here again it is immaterial whether the division takes place within outward or from without inward. I now bring the heel down, by extreme or forced flexion, and the foot into its proper position by main force.

The operation is only a small portion of the treatment necessary to produce a permanent good result in any variety of club foot. A great deal depends upon the care and attention which is bestowed upon the after treatment. If this be neglected, the results will surely be unsatisfactory.

A great variety of mechanical appliances have been used, with a view of gradually moulding and shaping the parts into a more seemly condition. These contrivances are all very well, and they have proven themselves of very great value in the treatment of talipes. In this boy's case, however, I shall trust to adhesive strips, and to systematic manipulation; for I am inclined to think that his foot can be brought into a very good position without the aid of any mechanical appliance.

Massage will be practiced daily. The manipulations will be thorough and systematic in character. They will be performed, not only with a view of correcting as much as possible the deformity of the foot, but also of increasing the strength and tone of the partially atrophied muscles of the leg. Besides this systematic manipulation of the parts, I purpose retaining the foot in its proper position by the application of strong adhesive strips. These strips will be broad (two to two and a half inches), and so applied as to draw the foot well outward at the same time that it draws it upward. To accomplish this, first secure the adhesive strip well in position, by causing it to encircle the ball of the foot; then carry it up the outer side of the leg, and draw it as tightly as may be necessary. Over this a bandage will be placed; lightly over the foot, and a little more firmly over the leg, to keep the strips from slipping. This is a very simple way of treating the lower degrees of equino-varus, but it holds the foot in a very good position, and I am in hopes of producing a good result here without the aid of an expensive apparatus.

Medical Societies.

College of Physicians, Philadelphia.

At the regular meeting of the College, on March 5th, a paper

On the Relation of Sewer Gas to Typhoid Fever

was read by Dr. George Hamilton. The following extracts will indicate the speaker's views:—

Centreville, Pa., my location in the country for more than ten years, was upon the ridge separating the Brandywine and Red Clay Creeks; distant seven miles from Wilmington, seven from Kennet Square, four from Dupont's, and eleven from West Chester. The surrounding country, rolling or hilly, abounded, in nearly every direction, with springs of fine water. In this rural section began my first bedside experience in

typhoid fever, and the occurrence in my practice of four cases of intestinal perforation in the space of twelve consecutive months, may but too well attest the character of the prevailing epidemic. It was not, however, until after five years' practice in this vicinity that typhoid fever developed itself; the usual form of fever in earlier years of practice having been bilious remittent, which, like the typhoid, at times assumed an epidemic character, and proved nearly as fatal as typhoid, while in other seasons but few cases occurred, the local conditions remaining essentially the same from year to year.

The change from bilious remittent to typhoid fever was, naturally enough, not abrupt, some of the symptoms of the former gradually giving place to those of the latter. In mode of progression there was a close resemblance between them; either disease showing itself upon an elevated plain, on the brow or slope of a hill, or in the vale below, with, perhaps, a slight preference for the latter; while the mansion of the opulent farmer would, in turn, be visited, with the home of the humble cottager.

The speaker mentioned several outbreaks of typhoid in this locality, and proceeded:—

As to the origin of these widely diffused, destructive epidemics, nothing could be said in explanation, except that, as a rule, a warm, moist spring, and, as a sequence, excessive growth of vegetation, followed by a hot, dry summer, appeared to favor the development of typhoid; just as had been noticed in former seasons in regard to bilious fever. In relation to the influence of local conditions, it may be said that in an old, long cultivated section, changes in these conditions rarely occur, and certainly nothing of this kind did occur that could explain the ravages of fever in one year and its absence or slight character the next; and hence the physicians of that section, so far as I knew, were nearly of one accord in regarding atmospheric, hygrometric, electric, or telluric conditions as the sources of the presence or absence, and of the violence or mildness, of the epidemic.

On returning to the city, thirty-three years ago, a location for practice was chosen at Sixteenth and Summer streets, and has thus continued ever since. At that remote period, intermittent, remittent and typhoid fever prevailed to a considerable extent, especially between Broad Street and the Schuylkill. Not one of these types can now be seen so often, in proportion to population, as during the earlier years of my practice in this locality.

Some years after returning to the city, Prof. J. K. Mitchell was called to consult with the late Dr. Gebhard and myself, in a severe case of typhoid fever near my residence. This was at a period when bilious remittent was being gradually supplanted by typhoid fever. Dr. Mitchell then stated to us that nearly all the cases of this disease seen by him were in consultations in the suburbs of the city, as in the case in which he met us, for at that time the locality was but a suburb; yet, in the suburbs at that period there were but few sewers or cesspools, and, as to water-closets, they were not to be found there; while on the contrary, in his own vicinity (Eleventh and Walnut Streets) they existed in all directions, and yet, as he informed Dr. Gebhard and myself, he scarcely ever saw typhoid fever in the families under his immediate care. Again, the late Dr. Wm. W. Gerhard, prominent as an authority in typhoid fever, informed me, about six years before his death, that he no longer regarded typhoid fever as either so prevalent or so fatal in this city as it had been in former years; that some modification of the disease, from unknown causes, had occurred, just as he had witnessed many years previously in Paris, where typhoid fever in some of the hospitals had gradually changed in character, until, from a mortality of one in three patients, only one case out of seventeen attacked terminated fatally. With the statements and opinions thus expressed, my own observations and experience fully accord.

During thirty-three years of practice in the city, four cases of typhoid fever, occurring in one family, have come under my care; in two or three families, two persons in each have been affected; yet, setting these aside, one case only in any family coming under my observation has occurred. This is in striking and most favorable contrast with what, as before stated, often happens in epidemic typhoid in the country, where no sewer gas or obstructed drains are to be found in explanation of this difference. The increase in the number of sewers, water-closets, and cesspools, in Philadelphia, for some years past, has been simply enormous; and consequently the opportunities for contamination of the atmosphere, water, or milk, correspondingly augmented. If (as some have asserted) sewer gas is the most potent and common cause in the production of typhoid fever, and if so large a proportion of the houses in the city are infected by it, would we not have, in a population of nearly nine hundred thousand inhabitants, cases almost without number, and deaths in proportion, far more than quadruple the average number reported by the Board of Health?

Physicians have long differed in opinion in reference to the conditions under which typhoid fever is likely to occur, and in regard to the influence exerted by the various agents known, or believed, to play a part in the production of this disease. While many, at the present moment, are disposed to accept the opinion that in an atmosphere contaminated by sewer gas, or effluvia arising from cesspools, or decaying animal or vegetable matter, is to be found the ostensible cause of the disease; others are more disposed to refer it to the use of milk or water infected by the agents just named, and, in addition, to the consumption of food partially decayed. On the other hand, there are those who, while admitting the possibility or probability that certain limited outbreaks of typhoid may be referred to the local causes just named, are fully convinced that the widely spread and fatal epidemics witnessed at times in the country can be explained by no such agencies as those alluded to; neither do we think that a practitioner who has had the experience of a single season of epidemic typhoid fever in the country can refer to these agents as the cause of such epidemic, without rejecting the evidence of his own senses.

Dr. James Jackson, of Boston, long before Pettenkoffer, in explanation of certain erratic

and very restricted outbreaks of typhoid fever, ventured to suggest that, in the absence of any visible agency, some emanation from the soil, obscure as to origin, might account for them. Pettenkoffer, however, determined that in proportion to the elevation or depression of the water level in the earth was a greater or less prevalence of typhoid fever, without fixing any limit as to the extent of its influence. When we call to mind that, as before stated, a hot, dry summer is, as a rule, the precursor of an unusual amount of fever, either remittent or typhoid, the view of Pettenkoffer demands attention and earnest consideration; for, after laborious and protracted researches, he announces, definitely, that in proportion as the water level becomes lower, typhoid fever increases. That many epidemics of the fever appear without the possibility of assigning any special cause in explanation of their origin, is manifest, and no one is more prepared to admit this than the practitioner and medical writer of large experience. Whatever may be the cause or causes of the fever, when once established, contagion, especially when aided by the concurrence of certain indefinable, elemental and local influences, lends its all-powerful aid in its extension; this, at least, is the opinion of Bretonneau, Trousseau, Louis, Gendron, Chomel, and many other investigators of the disease in France, England and the United States; among the latter, Drs. Nathan Smith, James Jackson, Elisha Bartlett, and Austin Flint, Sr.

Of the writers quoted, nearly all recognize that very frequently the disease arises spontaneously, and while some of them admit that a limited number of cases may be due to emanations from sewers or cesspools, others, regarding typhoid fever as specific in character, claim that a specific cause is necessary to develop the disease; and that they find no sufficient evidence of such cause either in the respiration of the effluvia alluded to, or in the consumption of unwholesome food.

In the earlier part of this paper it was stated that the reports of the Board of Health of this city did not warrant the anxiety and alarm that exist in relation to sewer gas, as the chief agent in the production of typhoid fever; and without going into details, a few points only will be adduced in reference to this matter. The reports show that very often the deaths from this disease are more numerous in the winter months than during the hot weather of the summer. For example, in January, February, and December, of 1878, the deaths, in the order named, were 34, 32, and 33, while in July the deaths were but 23; yet this month, as shown by the record of the last ten years, is the hottest of the year, and consequently is the period when fermentation, decomposition and putrefaction are most actively engaged in evolving effluvia from animal or vegetable substances. This record of facts and figures may, by some, be regarded as inconceivable and perplexing, yet it finds its counterpart in the country, where during one entire winter the disease was unusually prevalent and fatal.

Quoting again from the Health Office reports, we find that in a series of years the weekly deaths from typhoid average but six or eight in a population of nearly nine hundred thousand; and it should be remembered that this includes the deaths in the almshouses, prison, penitentiary, hospitals, house of correction, and all other similar establishments, making, at least, one-fifth to be deducted from the total reported.

The readiness of some physicians to attribute to sewer gas an attack of typhoid, if any smell denoting its presence in a house can be detected, is surprising, when every physician knows that this is only an exceptional event. To get over this difficulty it is now declared in some quarters that, although the smell be wanting, the gas is present, and capable of producing an attack. This is an unfortunate discovery, if it be a discovery; for it would follow from this, that, after much expense in the effort to banish gas where it was known to exist, from the sense of smell, it might still remain, although imperceptible, and keep the family in painful suspense. But have we any tangible and conclusive proof of this lurking, unforeseen danger, and, if it really exist, is it not remarkable that in the thousands of houses, where the odor is annoyingly perceptible, it appears to do so little mischief?

The sources of local contamination would seem to be infinitely more numerous in the city than in the country, yet without discouraging those who promise to stamp out disease. The real difficulty is when an epidemic of a violent and extended character starts up, as it has been known to do, in certain mountainous parts of Virginia and Tennessee, in their almost pristine condition, without the semblance of filth to account for its origin. It is evident, then, that whatever cases of typhoid fever may have been traced to sewer gas, or local contamination, some other cause or causes must be sought to account for the frequent and disastrous outbreaks in the rural sections; and this, it is clear, was in the mind of that sagacious observer and logical thinker, Dr. Charles Murchison, when he declared his belief in the origin *de novo* of typhoid fever, placing himself, in this point, upon the platform occupied by all the celebrities named in the earlier part of this paper.

Directing our attention once more to the health of our city, as exhibited by the Board of Health from week to week, we see no rational cause for anxiety or alarm; for while the deaths from pneumonia, for the last five weeks, have been very numerous, exceeding by far the total number caused by typhoid fever, diphtheria and scarlatina, taken together, the city, as to general health, may still be, as it has been for many long years, regarded as one of the most healthy of large cities.

(*To be Continued.*)

The American Medical Association

Holds its annual meeting next week, at Atlanta, convening on the sixth of the month. There is every reason to expect a full attendance from all parts of the country.

The Medical and Surgical Reporter will be represented by Mr. George Keil, who will also have charge of the other medical publications of this office. We have arranged to receive full, early and accurate reports of the session.

Editorial Department.

Periscope.

Suggestion for the Removal of Foreign Bodies in the Ears and Nose.

Dr. A. Couvert writes to the Atlanta *Medical and Surgical Journal*:—

The benefits of posture of head are not to be disregarded in removing heavy bodies, nor of drawing back the ear so as to straighten the meatus, nor of so keeping the point of the syringe pressed to one side as not to obstruct the outflowing current with its freight of foreign matter; neither should it be inserted far into the meatus.

When I was a boy, I saw an old negro ("Uncle Sawney") blow a china-berry out of a little boy's nose, after a real doctor (not one of your patent medicine breed) had failed, in spite of his expert manipulations and glittering instruments. It was thus done. The boy was held, head and hands. Sawney's finger pressed the unobstructed nostril, to prevent escape of air; his open mouth covering the whole of the boy's mouth, he "blew him up," and then with a sudden puff brought out the berry, like a wad from a popgun. I came into the profession remembering Sawney, and have removed in the same way peas, corn, pretty-by-night seed, and other things, without blood, bawling, pain or trouble; but as the operator gets a splash of nauseous secretions in his face, I magnanimously operate by proxy, usually; only supervising an operation which, presto, confers the degree of doctor of *nose-ology* on several other Sawneys of different colors and races, who happen to be only lookers on "in Israel." I should add, this blowing by Sawney was done more than half a century ago, and I still follow it, *con amore*.

The Fungus of Typhoid Fever.

It is remarked in the *Lancet*, that the announcement of the discovery of the fungus of typhoid fever will be received with considerable hesitation by most of our readers, with the result of certain not very remote investigations in their minds. Nevertheless, a series of researches which have recently been published by Dr. Letzerich, of Braunfels, and which appear in the *Archiv für Experim. Path.*, are worthy of at least a passing notice. A year or two ago this observer announced the constant presence in the blood of persons suffering from typhoid fever of isolated micrococci and of spherules of protoplasm, which, under cultivation, speedily developed to micrococci, minute, round, or ovoid refracting corpuscles, moving in the blood-plasma, and possessing a great power of resisting the action of acids and alkalies. By the simple growth of these isolated bodies, there arise, it is said, spherules of protoplasm, in which appear myriads of first rods and then granules. In the height of the disease the blood from the arm contains, moreover, colonies of micrococci connected together irregularly, but these are believed to come, not from the blood, but from the lymph spaces. Both the forms which are seen in the blood, the granules and spherules, wander through the walls of the vessels into the tissues, and in the nerve tissues they are said to cause signs of irritation.

Many experiments were made upon rabbits by the injection of the organic bodies from the typhoid stools. By allowing the stools to stand in glass cylinders, and repeatedly washing, a layer a few millimeters thick was at last obtained, containing a large proportion of micrococci. The injection of this caused in rabbits a typhoid-like illness, lasting a fortnight, ending sometimes in death, and presenting after death enlargement and induration of Peyer's glands, and great swelling of the mesenteric glands. The appearances were the same whether the poison was given by the mouth or by hypodermic injection. In the latter there was first an infection of the neighboring lymphatic glands, due to a growth of organisms and increase of cells. By the extension along the lymphatics these micrococci become generalized, and post-mortem they may be recognized everywhere in the system.

The Treatment of Infantile Paralysis.

During the acute or febrile stage, Dr. Simon, of Paris, recommends the use of the vapor bath, administered to the patient in bed, diaphoretics and soothing draughts, with dry cupping or flying blisters to the vertebral column. When the disease has entered on its second stage, and the paralysis is localized, frictions and kneading. Electricity should also be persevered in; the continuous current is best, very weak, and applied from above downward, with precaution. At the same time, fresh air, sea or sulphur baths, quinine, cod-liver oil in the winter, and arsenic in the summer. Gymnastic exercises for the affected limb. In fact, for this stage of the malady the various means calculated to stimulate the muscles or the nervous system should be employed successively or in combination. In the third stage, when deformity has occurred, recourse must be had to orthopædic apparatus. Dr. Simon rejects tenotomy absolutely in cases of paralytic club foot, the only result of the operation being to do away with the action of the only muscles which can serve the child as support.

Intermittent Broncho-pneumonia.

Mr. Cripps Lawrence, at a meeting of the Harveian Society, of London, in February, read a paper on this form of broncho-pneumonia, which he described as an anomalous form of hyperæmia of the lung. A number of cases were related. The first was a boy, aged 15, who had smallpox, followed by measles, after which lung disease on the right side set in. There were the usual evidences of inflammation of the lung, but with a marked difference between the morning and evening temperatures. The temperature once reached 104°, the pulse being 120, and the

respirations 28. The variations of temperature were constant, as well as considerable. There was dullness with crepitation, first on the right side and then on the left. The patient made a steady progress to convalescence. In a second case, there were cough, with pyrexia, and some dullness at the upper portion of the right scapula. Then a small patch developed at the top of the left scapula. The diurnal pyrexia was powerfully influenced by quinine given in full doses. In a third case, which was slight, and which was apparently due to the cutting of a drain, quinine was also of great value. In a fourth case, quinine also did good. The periodicity of the rise of temperature, he thought, indicated quinine. The treatment otherwise consisted of rest in bed, nutritive food, and jacket poultices, followed by cotton wool jackets when the poultices were abandoned. He thought these cases not lobar pneumonia, spreading by continuity, but a malarial malady, connected with swamps or excavated earth. He here produced a considerable mass of evidence in favor of this view. It had been found as a remittent paludal disease in some parts of France.

Absorption of Cataract Produced by Internal Medication.

In the *Gazette des Hôpitaux*, January 16, 1879, Dr. Tamanichef reports a case of a man, 48 years of age, of a strong plethoric constitution, who had a cortical cataract of the left eye, for which was prescribed protoiodide of mercury, which he took for a month and a half with good results. The treatment interfering with the patient's occupation, it was discontinued, and iodide of potassium given internally. Three or four months of this treatment was continued, when the patient began to read large typographical characters, but died suddenly, from apoplectic seizures. This and other well known cases, the author considers, prove the absorption of the opacified crystalline in cases of cortical cataract. In explanation of this mode of treatment, the author states that the remedies pass through the general circulation into the liquids of the eye, and operate immediately upon the inflammatory process of the crystalline. He quotes several cases, both in his own practice and in others, where cataract was spontaneously reabsorbed without any other lesions of the eye, with a view of calling attention to the different phenomena which the eye presents under the influence of internal remedies.

On the Treatment of Strangulated Hernia by Ergotine.

Dr. Planat, of Nice, has treated successfully two cases of strangulated hernia with ergot.

The first patient was a man, aged fifty, who suffered from a hernia which had been strangulated on the previous day. Ergot was applied both internally and externally, in the form of ointment, which was rubbed on the tumor every two hours, the latter having been previously washed with warm alkaline water. The internal treatment consisted of 5 grams of ergot, mixed with 125 grams of water and syrup, taken every hour. After this treatment had lasted four or five hours, the vomiting ceased, and twelve hours later the hernia had become spontaneously reduced.

The second case was that of a young man, aged twenty-eight, who had worn a truss for several years before the hernial complication set in. The hernia had resisted all efforts to reduce it. Fifteen leeches had been applied to the tumor, but six only took; the symptoms then grew worse, and ergotin was again resorted to, being administered as above. Eleven hours later, when the surgeon arrived to perform the operation, in case the ergot had proved unsuccessful, the hernia was reduced, and the patient was well. The author suggests whether the drug would not be perhaps more efficient if directly injected into the hernial sac, and not taken internally.

Remote Results of Post-partum Hemorrhage.

On this point Prof. A. R. Simpson says, in the Edinburgh *Medical Journal:* It has always seemed to me that while the immediate dangers of hemorrhage are well understood and set forth in text books, its more remote risks have received less attention than they deserve. I have so often seen insanity, or phlegmasia, or pelvic inflammation, or general peritonitis arise in patients whose labors had been complicated with a flooding, that I was not surprised when the dreaded rise in temperature took place in our patient, and the abdomen began to be tympanitic. All precautions were taken to prevent any septic poisoning in this case, and if we are to assume such a poisoning, I do not know where to find its source. Seats of absorption, of course, there were plenty; but the patient's own discharges were not unhealthy, her canals being regularly syringed with an antiseptic lotion, and the hands, instruments, and sponges that were applied to her were all carefully cleaned. The case appears to me to illustrate the special proclivity to inflammatory affections of a woman who had suffered from an extensive loss of blood.

On the Prevention of Fatal Accidents from Using Anæsthetics.

Dr. Simonin gives, in the *Revue Méd. de l'Est*, 5 année t. x, No. 9, p. 261, the following three observations, which may be considered as very important if attended to. 1. Progressive peripheric insensibility, especially in the temporal region and the cornea. 2. The condition of the muscles and the jaws; the former must be in a complete state of relaxation, and the jaws closed. The adductor muscles of the lower jaw, therefore, form an exception to the rule, by being in a state of trismus. 3. The state of the pupil, which must be contracted, while the respiration becomes more normal, having been much quickened during the stage of excitement. All these phenomena are very important; they are synchronous, and must be carefully observed, as well as respiration and circulation. If the three symptoms cited should not appear coincidently, they must be carefully watched for in various stages of the anæsthesia, because they are sure to appear at a given moment.

Medical Uses of Nitro-glycerine.

Mr. W. Murrell reports, in the *Lancet*, January, 1879, pages 80, 113, 151, the results he has obtained from the exhibition of nitro-glycerine, as compared with nitrite of amyl, in angina pectoris. It was in 1858 that Mr. Field, of Brighton, and others, drew attention to the value of glonoine—nitro-glycerine, nitrate of the oxide of glycyl, as it was variously named—in spasmodic affections, epilepsy, neuralgia, etc. At that time it was, and has still continued to be, a trusty agent in the hands of the homœopathist. It was found that glonoine produced the same effect upon the pulse as nitrite of amyl, but that, whereas the latter drug relaxed the vessels in fifteen seconds, and that a return to their normal condition occurred in a minute and a half, when glonoine was employed in proper doses relaxation took place more slowly, and a normal condition was not resumed for nearly half an hour; a series of carefully taken sphygmographic tracings well illustrate this fact.

Another remarkable result of the glonoine, seen in a patient with epispadias, was the great increase of urinary secretion, which "licked everything" he had ever taken. In a quarter of an hour after a dose more than an ounce and a half of urine was secreted in excess of his usual quantity. This man was peculiarly unsusceptible to the physiological effects of the drug, as far as subjective symptoms were concerned, complaining of no headache or throbbing; still the effect upon the pulse and urine was most marked. The cases of angina pectoris in which the drug was exhibited are fully reported, and the marked benefit that followed its use can leave no doubt on any mind that in glonoine the practitioner has a most reliable agent in this very serious and distressing complaint.

Reviews and Book Notices.

NOTES ON CURRENT MEDICAL LITERATURE.

——Dr. J. N. De Hart speaks of the microscope in its relation to medicine and cerebral pathology, in an article of twelve pages, from the Chicago *Journal*.

——The official report of Dr. E. O. Brown, physician in charge of the yellow fever hospital, Louisville Ky., 1878, makes a pamphlet of twelve pages, with elaborate tables and a map appended.

——Dr. Squibbs' little work, "Proposed Legislation on the Adulteration of Food and Medicine," is published by G. P. Putnam's Sons, and is for sale by Lindsay & Blakiston; price 25 cents, and it is well worth the money.

——In a pamphlet of 12 pages, Dr. J. W. Singleton, of Paducah, Ky., gives a sketch of the life of the late Dr. John L. Cook, of Henderson, Ky. Dr. Cook was one of the noble army of martyrs who fell in the yellow fever epidemic last year.

——The difficulties and dangers of Battey's operation are well set forth in a reprint from the *Transactions* of the American Medical Association, by Dr. G. J. Engelmann, of St. Louis, who, in spite of them all, is an ardent advocate of the procedure.

——Part v of Dr. Duhring's "Atlas of Skin Diseases" embraces scabies, herpes zoster, tinea sycosis, and eczema vesiculosum. They are excellently illustrated, and the work gives great satisfaction as it progresses. For sale by J. B. Lippincott & Co.

——Through Messrs. Bailliere, Tindall and Cox, of London, we have a pamphlet of 16 pages, price one shilling, entitled "The Treatment of Dropsy of the Gall Bladder by Operation (Cholecystotomy)," by George Brown, M.R.C.S. It is illustrated, and gives the notes of a successful case.

——The Iowa and Illinois Central District Medical Association has commenced the issue of a quarterly report of their proceedings. We repeat our opinion that such publications are a mistake. They can never attain a wide circulation. The columns of a medical journal are the proper avenues to publish proceedings of medical societies.

——Mr. E. B. Treat, of New York, announces the approaching publication of a series of photographic illustrations of skin diseases, from negatives taken from life, accompanied by a descriptive text, calling attention to the diagnostic character of the various diseases, and giving practical suggestions for their treatment. By George Henry Fox, M.D., of New York.

——In a reprint from the Chicago *Medical Journal and Examiner*, Dr. E. Fletcher Ingalls discusses the question, how shall the degree of doctor of medicine be conferred? He suggests a central board of examiners, who shall send series of questions to all colleges, to be answered in writing by the students, and on these answers the decision be rested. This is a cumbersome scheme, not likely to be approved.

——Part I of an "Atlas of Histology," by Dr. E. Klein, F.R.S., and E. Noble Smith, M.R.C.S., has been issued from the press of Smith, Elder & Co., London, and J. B. Lippincott, of this city. Dr. Klein, whose merits as a histologist stand unrivaled, has contributed the text, and Mr. Smith has drawn and executed the illustrations. The present number begins with the blood and its histological elements, and the epithelium.

The Atlas will be completed in ten or twelve monthly parts, and will be sold at $1.75 per part. It will unquestionably be an admirable production.

——Lippincott's Magazine, for May, opens with a brilliantly written and finely illustrated paper, by Mrs. Sarah Butler Wister, which propounds and answers one question, "Why do we like Paris?" In another illustrated paper, "From Norway to York," H. M. Robinson describes graphically canoe travel and transportation in the territory of the Hudson Bay Company. "The Tramp in Four Centuries," is a close but somewhat enigmatical study of a class which is commonly supposed to be a modern innovation, but which is here shown, on the evidence of curious unpublished letters, to have made its appearance on every occasion of social and financial revolutions. Other entertaining articles fill the number.

——Dr. T. M. Stevens, of Indianapolis, has had reprinted from the St. Louis *Medical and Surgical Journal* a strong attack against the pretended expert testimony of physicians in medico-legal cases. His opinions may be judged from the following extract:—

"We find that often experts may be honest, but ignorant; or they are rendered incompetent by dishonesty of purpose or by being confused or intimidated by counsel or surroundings. Now, in either of such cases they certainly were not, at that time, true experts.

"The time has come when, if the plan is permitted to continue, in spite of the warning and contrary to the wishes of the medical profession, then the gigantic evil of *false expert testimony* must cease, by some means; and if nothing else will stay its course, then the court record must be brought forth and arrayed before the profession, so that, if naught else will incite to *knowledge*, *honesty* and *courage*, fear of exposure must add its influence."

BOOK NOTICES.

A Guide to the Qualitative and Quantitative Analysis of the Urine. Designed for physicians, chemists and pharmacists. By Dr. C. Neubauer, of Wiesbaden, and Dr. J. Vogel, of Halle. With a preface by Prof. R. Fresenius. Translated by Elbridge C. Cutler, M.D., etc. Revised by Edward S. Wood, M.D. New York, Wm. Wood & Co., 1879. 8vo, pp. 551.

If there is anything in a fair array of names, the above titles should herald a solid production. So they do; although it was hardly worth while placing Fresenius' name on the title page, seeing that his "preface" is but sixteen lines of the most formal matter, written twenty-five years ago, to introduce the first edition of the book. The title also gives the impression that the book is a joint product of Drs. Neubauer and Vogel, whereas it consists of two separate treatises, bound in one volume. That of Neubauer is "on the chemical and microscopical characteristics and properties of the urinary constituents, with a guide to the qualitative and quantitative chemical examination of normal as well as abnormal urine;" while the work of Dr. Vogel is on "the semeiology of human urine, together with a guide to the examination of urinary calculi and other urinary secretions." Thus the former gives the purely chemical, the latter the medical, view of the subject. There is, however, by this method, a certain amount of needless repetition, as we have noted in various instances, and a necessity for cross references, which is not desirable, and is annoying to the reader.

Apart from these criticisms on the form, the volume merits great praise. It is carefully translated and very handsomely printed. Plates of fine execution are added, as well as numerous illustrations. The chemical matter is thorough, and includes all that is certainly known on the subject.

Spermatorrhea; Its Causes, Symptoms, Results and Treatment. By Roberts Bartholow, A.M., M.D., etc. Fourth edition, revised. New York, Wm. Wood & Co., 1879.

The monograph of Dr. Bartholow has met with a favorable reception, and appears now with additions and such revision as were required to render it representative of the actual state of our knowledge of the disease in question.

A Clinical Treatise on Diseases of the Liver. By Fried. Theo. Frerichs. In three volumes. Vol. II. Wood's Library of Standard Medical Authors.

In the REPORTER for April 12th we noticed the first volume of the able treatise of Frerichs, and announced the early appearance of the remaining two. The present one has a neat colored frontispiece, and is in other respects well brought out. As a treatise widely esteemed on both continents, it will be read with interest and profit. The author's position in Berlin has allowed him most extensive clinical advantages, and his work still maintains the lead on the subject.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	**$5.00**
Half-Yearly Compendium of Med. Science,	**2.50**
Reporter and Compendium, - - -	**7.00**
Physician's Daily Pocket Record, - -	**1.50**
Reporter and Pocket Record, - - -	**6.25**
Reporter, Comp. and Pocket Record, - -	**8.25**

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

D. G. BRINTON, M.D.,

PHILADELPHIA, PA.

THE GROWTH AND WORTH OF THE METRIC SYSTEM.

The progress of the metric system in this country is agreeable to the friends of its introduction. Last February the New York State Medical Society, after hearing the proposition made by the chairman of this committee, voted the following resolution, presented by Dr. Castle:—

"*Resolved*, That the New York State Medical Society requests of those who present papers at its future meetings that the metric system be employed in their communications, and that this system be *exclusively* used in the published proceedings of this Society."

The following resolution was presented to the Medical Society of New York County, and it is urged that other county societies take like action:—

"*Resolved*, That the Medical Society of the County of New York request the medical boards of the hospitals and dispensaries to adopt the metrical system in prescribing, and that the faculties of the medical colleges in this city be also requested to order its adoption in their didactic and clinical departments."

The advantages claimed for the metric system are principally in two directions: first, that by adopting it we bring ourselves into conformity with most European nations, and thus save endless trouble in the useless work of changing tables of one set of measures into another before we can compare them. Scientific results, expressed in scales of Fahrenheit's thermometer, in pounds, gallons and feet, can only be brought into comparison with those expressed in meters, liters and degrees of centigrade, after a very tedious and totally useless mathematical calculation.

Secondly, the metric system being on the decimal basis, is far more easy to subject to the processes of arithmetic than any other. Much may be said, indeed, in favor of the duodecimal system; and the ancient Assyrians combined them both in a highly ingenious manner, which certainly presents, for some lines of calculation, advantages over either alone. But the decimal is unquestionably better than any system which involves the handling of common fractions.

As to the basis of the metric system, it is, we regret to say, faulty and unscientific. It is vitiated with a mathematical blunder at its outset, and it seems hard that we should be called upon to perpetuate it. The meter was adopted first by the French Reformers, after the Revolution of 1789. Assuming that the globe is a body of invariable dimensions, they attempted the almost impracticable task of making a trigonometrical survey of a quadrant of the earth's surface, and completed their labors by constructing a standard meter, which should be exactly one ten-millionth part of the distance from the equator to the pole. Unfortunately, it has since been shown that these learned men were wrong in every particular. The earth is not invariable in dimensions, the equatorial circumference is not a perfect circle, so that there are different equatorial axes, and, therefore, different lengths in different longitudes; and, lastly, it has been proved that the survey made by the French physicists was incorrect, and accordingly the supposed perfect meter was erroneous, to the considerable extent of one part in 5527. When the latter fact could no longer be denied, it became necessary either to alter the assumed length, or to abandon its sup-

posed relation to the earth's dimensions. For obvious reasons the French Government decided in favor of the latter course.

Hence the unit of the metrical system is an imaginary one, found in no constant relation to the proportions of the globe or solar system, and not a whit superior to the English foot or the Hebrew cubit.

A truly scientific standard would be one based on some constant relation of the kind; and until such a one is established we may be permitted to look with moderate enthusiasm on the metric system. Its only solid recommendation is the convenience of comparison and calculation which it offers; but this is, as we have said, very great indeed.

Notes and Comments.

Effects of Climate in Phthisis and Rheumatism.

Dr. H. Peters, of Saxony, has made a careful study of this subject, and his results are as follows:—

In chronic phthisis and chronic catarrhs of the respiratory organs, aggravation occurred on the colder days, and concurrently with a rapid fall in the mean daily temperature. It also occurred with a high atmospheric humidity, with a prevalence of northerly and westerly currents, and (contrary to the ordinary opinion) when ozone, or the substance giving the so-called "ozone reaction," was present in large amount in the air. The days on which no aggravation took place were those with low relative humidity, a greatly diminished mean relative humidity, a prevalence of southerly currents, and a low percentage of "ozone."

In the cases of chronic rheumatism the patients got worse when the mean temperature fell considerably from one day to the next day or days, when the relative humidity and the amount of "ozone" were high, and the wind blew from a westerly direction. They were unaffected, on the other hand, on days of high mean temperature, with a low relative humidity, and but little "ozone" in the air. With regard to barometric pressure, the only positive result made out in the chest cases was that in "the majority of the patients their disease was aggravated or much intensified on the days when the pressure was high." No positive conclusion, on the other hand, could be arrived at as to a connection between aggravation of chronic rheumatism and pressure.

On Ophthalmia Neonatorum.

This affection is the subject of an article in the North Carolina *Medical Journal*, by Dr. Richard H. Lewis. He sums up the therapeusis as follows: If I were called on to define exactly the treatment I would specially recommend, I should say this: Cleanse the eyes in a careful and thorough manner, with a lotion composed of sulphate of zinc one grain, alum three grains, water one ounce, which, by the way, is the favorite remedy of the Surgeons of the Royal Ophthalmic Hospital of London, just as often as the accumulation of discharge demands, and every 12, 8, 6, or 4 hours, according to the severity of the case, instill into the eye a drop or two of a solution of nitrate of silver, of the strength of two grains to the ounce of water.

Under this treatment, if promptly undertaken and faithfully carried out, I am confident that very few cases would fail to recover completely.

The Physics of Emulsifying.

An English exchange states that Prof. Quincke, who has just published an essay on the subject, considers that the process is due to the expansion or widening out of thin soap films from the surface of the oil. The formation of these films causes vortices in the interior of the oil and in the adjoining fluid, which lead to the breaking up of part of the oil, and the formation of extremely minute drops. Very small quantities of soap—so small indeed as not to be recognizable under the microscope—are sufficient to cause the phenomena described. Fats which contain free fatty acids form solid soaps in a weak solution of soda, which dissolve in the fluid surrounding the oil drops, and spread over their surface. This film, or a succession of them, renders the surface of the oil drop immovable, and prevents the drops from coalescing, thus maintaining the condition of emulsion.

The Identity of the Poisons of Scarlatina and Typhoid Fever.

An able London physician, Dr. G. de Gorrequer Griffith, maintains, in the *Medical Press and Circular*, that typhoid and scarlet fevers both arise from the same poison, whatever that may be. Erysipelas and puerperal fever he believes are probably also effects of the same toxic elements, the poison being one and the same, the symptoms or diseases resulting from it differing with the age, sex and condition of the patient.

Correspondence.

Foreign Body in the Œsophagus.

Ed. Med. and Surg. Reporter:—

For the encouragement of those who believe in nature's abilities, let me report the following case. A little girl, aged four years, was brought to my office in great haste by her mother, who stated that, while at play with some other children, they got her to swallow a piece of glass. She saw the child nearly choking, and in her fright took her by the shoulder and shook her severely, and it went down. As it had not cut or lacerated the mouth or throat, I quieted her fears as best I could, and ordered small doses of oil once a day. Three days after she passed at stool a small piece of glass, in shape like a bent elbow, each arm being seven-sixteenths of an inch long, with four moderately sharp corners. No other trouble.

I have long been in the habit of making strong applications of tincture of iodine to my erysipelas patients. I was lately (February, 1879) called to see a severe case, which had just had a relapse from convalescence from a previous severe attack, and the low condition of the patient, a young lady of twenty-five, made me fearful of the result. After painting the part affected (her face, neck and anterior scalp) well with tincture iodine, I ordered her ten drops in lemon syrup every three hours, combined with nux and belladonna. The third day she was convalescent again, and made a good recovery. I never heard of a similar use of iodine in such cases, and would like to know if it is new. I certainly shall try it again when I have opportunity.

Trenton, Mo. C. A. Freeman, M.D.

Pleasant Means of Medication.

Ed. Med. and Surg. Reporter:—

There is no point in practical therapeutics that tells more for a physician than his ability to render pleasant the remedies which he employs. This, indeed, seems to be an item in the rôle of practice but little thought of. Instead of becoming a vital consideration, the neglect of it, perhaps, lies at the root of more failures in practice than we imagine. Our ancestors might employ drugs in their crude and unshielded form, but the physician of this period must arouse himself to the fact that there are forces at work to-day which our forefathers could not foresee. Society has changed, and this link which unites with it the science of medicine must be tempered proportionally. We are not the sturdy, rough and ready nation we were a century agone—we have become more élite. The popular voice is for those elements which are at once agreeable and congenial.

Amid this changed condition, we, as progressing men, must be alive to the necessities and demands of those upon whom we are dependent. The objection to unpleasant medication meets us at every turn of professional life. It stands out as the stigma to our system of therapeutics, recognized by the popular mind universally.

Homœopathy—springing, as it did, from the aberrations of an intellect of questionable sanity—owes most of its short-lived triumphs to that one plan in regular therapeutics. Many are the families who have preferred to risk the disciples of Hahnemann rather than take the disagreeable compounds so frequently prescribed by our own school. He who has looked into the history of medicine could not fail to have noticed the steady progress of scientific medicine, yet the wheels do not roll unclogged. There must be wrought a change, and it should be impressed upon the minds of practitioners and students of medicine from those centres of education, the lecture room and the press. Many a course of lectures upon Materia Medica and Therapeutics give but a general allusion to the various menstrua which should be employed to shield the different unpleasant drugs. How rare a thing is it to see in the journals of the country an article, either to arouse or to instruct upon this topic. I have recently perused the numbers of one of our leading periodicals for years back, without finding a line aimed in this direction. I take it as the duty of medical men to be zealous in recognizing defects wherever existing, that we may develop in medication a greater degree of perfection.

J. W. Hickman, M.D.

1945 *N. 11th St., Phila.*

Some Cases of Diphtheria.

Ed. Med. and Surg. Reporter:—

I was called to attend Mrs. S., in confinement; delivered a healthy child. Six days after confinement the mother complained of sore throat. Her family attempted to treat without calling a physician. Two days later I was sent for; found a severe case of diphtheria. Up to this time the child had nursed, and was doing well; ordered child to be fed, and not allowed to nurse. It was also taken out of the house, to a neighbor. Two days later the mother's condition was much improved. Husband sick now with violent symptoms of diphtheria, local and general. One day later child was brought back to the house, with the remark that the baby has diphtheria. I turned to examine it; found throat and nostrils filled with diphtheritic membrane, and the breath terribly offensive. On one occasion I removed several large pieces of membrane from its throat, the membrane having become detached, but it soon reformed; child was eleven days old when it was taken sick (with diphtheria), and died from the disease six days after the commencement of the attack; mother and father recovered. Four of their relatives, who were in the habit of visiting the above family, were taken sick with diphtheria, in rapid succession, one of them severely, the others slight and moderately; all recovered. The points of interest to me were:

1. I have never heard of or saw a case of diphtheria in a woman who had been so recently delivered.
2. I have never seen or heard of a child suffering from diphtheria so young as this one.
3. Did the child contract the disease in utero?
4. Did it contract the disease through nursing (the milk)?
5. Did it contract the disease by breathing the contaminated air of the mother's bedroom?

6. Which was calculated to give the child the best chance for recovery, to allow it to continue nursing and depend upon the remedies used in the treatment of the mother to so affect the milk as to be beneficial to the child, or to do as was done in this case, rely upon artificial food and a separate and direct treatment? (The child was removed with the hope that it might escape an attack of the disease, and that it might not nurse.)

This case reminds me of a case of scarlet fever I saw in a woman (several years ago), who contracted the disease from some of her children which she had been nursing. When she was taken sick she was nursing at her breast a babe six weeks old. I at once ordered the babe to be fed artificially, and not allowed to nurse. This they did not do until the following day, when the child was taken away from its mother and not again allowed to nurse. Mother died on the fifth day of the disease. The child never contracted the disease, though the mother's case was a most malignant one.

Marshalltown, Iowa. H. L. Getz, M.D.

Type of Pulmonary Disease.

Ed. Med. and Surg. Reporter:—

In the Reporter of April 12th, page 316, I see a communication from Dr. Thomas M. Matthews, of Edom Texas, on "An Epidemic of Obscure Pulmonary Disease." I take occasion to say that this part of the country has been visited by an epidemic of a somewhat similar character, but more minutely and clearly described by Prof. Da Costa in the Reporter of March 8th, page 208.

The catarrhal, the gastro-intestinal, the cerebral symptoms, the nervous disturbance, and the depression, are so clearly set forth in Prof. Da Costa's clinic upon the prevailing epidemic influenza at the Pennsylvania Hospital, and so nearly identical with the symptoms of the epidemic that has prevailed here from about the 7th of January, 1879 to the latter part of March, that I do not think it worth while to take up your time and space to recapitulate them. The epidemic here ranged from signs of ordinary coryza to severe cases of pneumonia.

In Dr. Matthews' communication he says that when the disease was properly treated, it was easily managed or controlled. I cannot say so much for the epidemic that prevailed in this section of the country, not drawing alone from my own experience, but from that of several of my neighbors, who I know to be educated and experienced physicians. The mortality has been extraordinarily large, and almost entirely among adults. Many persons have succumbed to this epidemic who were previously in poor health, and who were more or less debilitated from other causes. In fact, a large majority of the deaths were of this class of persons. When the cases were seen early, and the constitution and previous health good, they were easily controlled, and made a good recovery, where a little delay might have proved fatal. And let me state right here, that when good food and plenty of stimulants were given, I met with the best results, and when patients objected to taking stimulants, or nurses failed to give the proper quantity, I had the hardest cases to manage. My treatment was a purgative sufficient to unload the bowels and portal circulation, followed by such remedies as are calculated to meet special indications as they arise, iron, quinia, cinchonidia, beef tea, whisky, wine and beer, and I have not yet seen a single case where over stimulation was productive of the least serious results. J. Chewring, M.D.

Renault, Ill.

News and Miscellany.

The American Association for the Cure of Inebriates

Will hold its tenth annual meeting at the Hall of the Young Men's Christian Association, New York City, May 13th and 14th, 1879. Many important papers may be expected.

T. D. Crothers, *Secretary*

The Association of Medical Editors.

The annual meeting of the Association of American Medical Editors will be held at Atlanta, Ga., on Monday evening, May 5th, 1879. The annual address will be delivered by the President, Wm. Brodie, M.D., of Detroit. All editors of medical journals and publications are entitled to membership in the Association.

Sixth Decennial Pharmacopœia Convention.

The following notice has been issued:—

To the several Incorporated State Medical Societies, the Incorporated Medical Colleges, the Incorporated Colleges of Physicians and Surgeons, and the Incorporated Colleges of Pharmacy, throughout the United States:—

By virtue of authority devolved upon me, as the last surviving officer of the Pharmacopœia Convention of 1870, I hereby call a General Convention, to meet in Washington, D. C., on the first Wednesday in May, 1880, for the purpose of revising the Pharmacopœia of the United States.

For the information and guidance of all parties interested, I refer them to the rules adopted by the convention of 1870, to be found on page 11 of the Pharmacopœia of the United States, and request their compliance with the spirit and intention of the said rules.

James E. Morgan, M.D.,
No. 905 E Street Northwest, Washington, D. C.

Proceedings of the Gross Banquet.

The committee who had charge of the banquet given to Dr. S. D. Gross, on April 10th, have published the Proceedings on the occasion, including the addresses, in a neat, muslin covered volume, adorned with a photograph of the eminent surgeon. The response of Dr. Gross gives a sketch of many interesting facts in his career, and many pleasant associations. The work can be had by enclosing the price, 50 cents, to the office of the Medical and Surgical Reporter,

The Yellow Fever.

An eminent specialist in this disease, who has been passing some weeks in New Orleans, writes us, under date April 21st, that sporadic cases of the disease have occurred this spring in that city, in houses where there were cases last summer, but the disease has not extended beyond the immediate premises. One genuine case was imported from Rio Janeiro, reaching New Orleans on the 26th of March. He was taken to the Fever Infirmary, recovered, and was discharged on April 10th.

At a meeting of the Davidson Co., Tenn., Medical Society, at Nashville, in March, Dr. E. L. Drake maintained that the fever was an imported disease, and that it cannot originate under the climatic conditions of this country. He concluded with the following propositions on the subject:—

1. The danger of attacks from yellow fever is in proportion to the amount of the poison taken into the system.

2. There is a systemic toleration of the poison, varying with the vital resistance of each individual, and zymotic action is mainly concerned in the process of sporulation and fructification without the body and not within, until the line of vital resistance is broken down, when this process may come into active operation, as in other effete matter, without the body; otherwise it would seem impossible for a single human being to escape.

3. In the midst of an epidemic depopulation of rooms and avoidance of confined areas of stagnant air afford the safest personal prophylaxis.

4. Quarantine of the ordinary lading of vessels, cars and other vehicles, and of the baggage and clothing of travelers from infected districts, should be rigidly enforced until disinfection is thoroughly consummated. Cities and towns should quarantine against infected districts, but the open country need not be put under restriction, as the facts in the case of the refugee camp near Memphis abundantly prove. Camps of refuge should be provided at convenient distances from a city or town infected, and the entire population exposed to danger should abandon all enclosures and live in the open air.

Arkansas Medical College.

At a regular meeting of the "Little Rock and Pulaski County Medical Society," held at their rooms April 5th, 1879, the following faculty was elected to put into operation "the Arkansas Medical College," under the charter granted said school of medicine in the year 1874: William Thompson, M.D., Professor of Principles and Practice of Medicine, and Dean of Faculty. James A. Dibrell, Jr., M.D., Professor of Principles and Practice of Surgery and Clinical Surgery. D. H. Dungan, M.D., Professor of Materia Medica and Therapeutics. Edward Cross, M.D., Professor of Obstetrics and Gynecology. A. H. Scott, M.D., Professor of Anatomy and Ophthalmology. J. H. Southall, M.D., Professor of Nervous Diseases and Medical Jurisprudence. Claiborne Watkins, M.D., Professor of Chemistry and Pharmacy. J. M. Pirtle, M.D., Professor of Clinical Medicine and Diseases of Children. J. J. Jones, M.D., Professor of Physiology and Secretary of Faculty. John R. Colburn, M.D., Demonstrator of Anatomy.

The Indiana Medical Bill.

The Indiana medical bill, after passing both houses of the Legislature, was vetoed by Gov. Williams. The sentiments of the profession at this outrage on science by "Blue Jeans Williams" may be judged from the following resolution, unanimously adopted at the annual meeting of the Knox Co. (Ind.) Medical Society, April 8th:—

WHEREAS, The protection of the life and the preservation of the health of the people are among the chief aims of good government, therefore,

Resolved, That we, in our capacity as physicians and surgeons, condemn the vetoing of the Medical Bill by Gov. Williams, as discreditable to himself, contrary to the spirit of the age, and derogatory to the dignity of the medical profession, as well as every other branch of science, and against the best interest of the people.

A Novel Partnership.

The Medical Society of Fairfield county, Connecticut, has been agitated over a professional question of a novel character. Some years ago Dr. Pardee, of South Norwalk, married a lady, and then paid her bills while she went to New York and attended lectures at the Homœopathic College. Having received her diploma Mrs. Pardee returned to South Norwalk, and the matrimonial firm conducted business together, the husband treating his patients according to the regular rules, and the wife securing a practice as a representative of homœopathy. Dr. Pardee's revolutionary conduct was soon brought to the attention of the County Medical Society. The charges brought against him were that he had carried homœopathic pills, etc., to her patients, and aided her in other ways. The matter has dragged along, as such cases are apt to do, going from the County Society up to the State Medical Society, and being then referred back, but at last the Fairfield county brethren have disposed of it by formally expelling Dr. Pardee.

Medical Fees in Prussia.

The Prussian Government proposes to do away with a fixed scale of physicians' fees, but to have a legal rate for the guidance of a magistrate when a charge is contested. This rate is as follows:—

For the first visit.....	2 marks (50 cents)
For subsequent visits.....	each 1 "
For a first consultation.....	5 "
For a second "	3 "
For a first office visit.....	1½ "
For a second "	1 "
For laryngoscopic, etc., examination.....	2 marks

For visits at night these fees are doubled or tripled. These are low rates, but in Germany science is cheap.

New Matter in Physiology.

Under this general heading Dr. W. H. Triplett, of Washington, delivered three lectures in this city last week. The points he brought out were as follows:—

First lecture. The law and the method of the animal circulation absorption, a rapid and easy process.

Second lecture. The portal and lymphatic circulations solved. The body of the higher animals one organ—it is cardiac—respiration its rhythmic movement.

Third lecture. The proofs of a great automatic reflex system of nerves to the vascular mechanisms for operating the circulation, in addition to the one of Sir Marshall Hall for operating the pieces of the bony skeleton.

The speaker's object was to bring into prominence the great physical laws of motion in fluids and gases, in their application to the development of organic form and the maintenance of the integrity of function. He illustrated his theme with the results of numerous experiments, and was listened to by an attentive audience.

Contributions in Laryngology.

Dr. Louis Elsberg, 614 Fifth avenue, New York, announces that he is preparing for the American Laryngological Association a report of what has been published in this country on laryngology and allied subjects, and will appreciate it as a favor if physicians will inform him of the title and publication of everything they have written on the subject of the throat, voice, etc.

Items.

—Dr. Lewis Windle, a physician of high repute in Chester county, Pa., died of heart disease, at Cochranville, on the 20th ult. He was sixty years old.

—Dr. Schliemann has invited Dr. Virchow and Dr. Linderschmidt, the greatest authority in Germany on prehistoric archæology, to assist him in his excavations at Hissarlik. Dr. Virchow has accepted.

—An Illinois man sleeps every night on a spot of ground left bare for the purpose in his house, and has an attendant shovel clean earth over him, to take the place of bedclothes. He believes that in this way he guards against disease.

—A French journal states that the waters of the Dead Sea are about to be worked for potash, iodine, and bromine. The projectors calculate on delivering potassium chloride in London at 90 francs per ton, thus underselling the Stassfurt manufacturers.

—Dr. Charles Evans died, April 21st, at his residence, 702 Race street, Philadelphia, aged 77. He was the author of "Cases of Insanity," published in the *American Journal of Medical Science*, and was for twenty years attending physician to the Frankford Asylum for the Insane. Since the year 1861 he had retired from active professional life.

—The Cremation Society of England, a joint stock affair, has received a check. Secretary Cross, of the Home Office, recently announced in the House of Commons that he will not sanction the proceedings of the company until they are approved by Parliament. English medical and legal circles object to cremation, because it destroys evidence of the cause of death.

—Russia is being transformed into one vast military barrack. It is now announced from St. Petersburg that from the commencement of the next scholastic year the Medical and Surgical Academy of St. Petersburg shall be transformed into a purely military medical establishment. The students, whose number will be limited to five hundred, will be regarded as public servants, and as such will have to take the oath of allegiance. They will all be taught gratuitously, being required, in return for this advantage, to serve eighteen months in the army for each year they pass in the academy.

QUERIES AND REPLIES.

Dr. J. D. Van N., of Ind.—Picrate or carbazotate of ammonia is given in doses of gr. ss-j, in pill form, three or four times a day. Dr. Slane, of India, has given as high as gr.viij in twelve hours. Its toxic effects in large doses are marked. (See Napheys' *Medical Therapeutics*, sixth edition, page 418, for particulars.)

Dr. L. G. A., of Ky.—Saccharated calomel is prepared by triturating one part of calomel with two of white sugar. The dose is governed by the amount of calomel required. It has been said by some that acrid properties are developed in the mixture.

Alvens.—The so-called "spruce gum," or "chewing gum," is not from the spruce tree, but from the "sweet gum tree," of the natural order *Hamamelaceæ*. But, in fact, most of the chewing gum sold is not from this or any tree, but is an artificial product, consisting substantially of paraffin sweetened with sugar. Its use is an unseemly and discreditable habit, but we are not aware that it is injurious to health.

Stella.—The consumption of fruit as a first course at breakfast is a praiseworthy custom, on sanitary grounds. We are glad to notice that it is growing in favor.

MARRIAGES.

BUECKING—WATKINS.—On Sunday, April 13th, at Chicago, Ill., by the Rev. L. Hoelter, of Evangelical Lutheran Emanuel Church, Dr. Edward T. Buecking, Professor of General, Descriptive and Surgical Anatomy, Bennett Medical College, Chicago, and son of Dr. T. Henry Buecking, Quincy, Ill., and Alona, daughter of Mr. T. Watkins, Chicago.

RANKIN—GARCIA Y SALAZAR.—In Cuidad, Victoria, Capital of the State of Tamaulipas, Republic of Mexico, Sylvester Rankin, M.D., formerly of Buffalo, N. Y., and La Señorita Francisca Garcia y Salazar.

WEAVER—KELLY.—On March 20th, at Ellsworth, Kansas, by Rev. Levi Sternberg, D.D., Myron H. C. Weaver, M.D., formerly of Huntingdon, Pa., and Miss Alice M. Kelly, formerly of Fulton Co., Pa.

DEATHS.

BROWN.—At Oneida, Knox Co., Ill., on Monday, April 21st, of chronic peritonitis, Benjamin F. Brown, M.D., in the 40th year of his age.

HUTCHINS.—On Wednesday, April 16th, at 796 De Kalb avenue, Brooklyn, Jeannie Morrow, daughter of Dr. Alexander and Mary P. Hutchins, aged 9 years and 9 days.

SYRUP-GLYCEROLE
OF
FERROUS CHLORIDE.

The Combination which all Forms of Iron must assume before Assimilation.

Superior to all other Iron Salts in that, while it is readily taken into the circulation, and does referruginate the blood, it does not ordinarily cause constipation nor headache. It is very pleasant to the taste, and is unalterable.

Ferrous Chloride is a neutral salt, consequently it has no action upon the teeth, and may be administered fearlessly. This fact and the delightful taste of my preparation render it an advantageous form for administration to children. Each fluid drachm contains one grain of Ferrous Chloride, which, owing to the certainty of its assimilation, is a full, active, adult dose.

HINTS IN THE OBSTETRIC PROCEDURE.

BY

WILLIAM B. ATKINSON, A.M., M.D.,

Lecturer on Diseases of Children, at the Jefferson Medical College; Physician to the Department of Obstetrics and Diseases of Women, Howard Hospital, Philad'a.

SECOND EDITION. ENTIRELY RE-WRITTEN AND ENLARGED. 12MO, CLOTH. PRICE, $1.00.

The very gratifying reception given this handbook of the essentials of the obstetrical art has led the author to submit it to a careful revision, and increase its size by adding a number of new topics.

It may safely be characterized as the most convenient, compact, reliable and handy *vade mecum* on obstetrics in the language; as the following personal and editorial statements sufficiently attest.

OPINIONS OF PHYSICIANS AND THE PRESS.

"It is really a '*multum in parvo*,' and will, I am sure, be of great service to multitudes in the profession who have hitherto followed the routine of old traditions."—*Prof. Fordyce Barker.*

"It is as good for the old as for the young practitioner."—*Dr. J. Marion Sims.*

"It abounds in extremely valuable hints, and is calculated to do much good."—*Prof. Goodell.*

"Founded upon the personal experience of the author, it must prove of value to the very wide circle of the profession who will be led to purchase it by their acquaintance with the author and his reputation."—(Philadelphia) *Medical Times.*

NEURASTHENIA.

A paper read before the Albany (N. Y.) Academy of Medicine, March 4th, 1879,

BY DR. W. O. STILLMAN.

The term neurasthenia, or nervous asthenia, comes from two Greek words, signifying a nerve and debility or loss of strength. Dunglison gives two synonyms: Neuralynamia and Debilitas Nervosa, the meaning of which are as nearly as possible identical with the chosen and more common appellation. It is a functional affection, which may or may not be accompanied with marked anatomical changes, and which is characterized by debility of the nervous system, varying in degree. A recent writer has graphically described it as the result of "over draughts upon a bank whose vaults are the ventricles of the brain, and whose currency is nerve fluid."

Nervous asthenia is a malady of recent origin, and is one of the concomitant evils of a delicately balanced and highly sensitive nervous organization. Being of but recent date, its literature is scanty and inadequate. It has been recognized by but few authorities in medicine, and has received but cursory attention at their hands. Dr. Austin Flint, Sr., in his "Practice of Medicine," devotes a page and a half to its consideration, and then acknowledging its importance, refers the reader to the department of mental hygiene. Dr. Geo. M. Beard has thrown considerable light upon this subject, and Dr. Weir Mitchell and Dr. Goodell, of Philadelphia, have paid some regard to it. Dr. J. S. Jewell, of Chicago, has also discussed it, in able review articles, and in a contribution to the American series of Clinical Lectures. Abroad it has received even less attention than in this country, not that observers there can be charged with being less alert and acute than at home, but because there is less of it there. Hugh Campbell, of London, has treated upon it, and Erb, of Heidelberg, has embodied a limited study of the disease in Ziemssen's Cyclopædia, vol. xiii. As before observed, it is found largely in this country. The prevailing characteristics of the American people are hurry and worry. The two together have launched this dire affection among us, and its preponderance here, compared with its frequency among Europeans, has given it the distinction of being called the American Malady. It behooves American physicians, therefore, to study it attentively—to consider its protean-like phases; to examine the conditions lying back of the same, and to regard carefully its etiology, prophylaxis, and treatment.

Every wave of financial distress that sweeps the mercantile seas strews the coast with these wrecks, and dots the main with struggling unfortunates crying for relief, laboring under the double burden of mental and monetary ruin. It is times like these that bring this class of cases before the physician. Then is his opportunity for studying them in all the multiform phases which characterize the disease. Then it is epidemic, so to speak, and the physician may better qualify himself to treat isolated and sporadic cases; to analyze different methods of treatment, and discover the different rates of progression under each. These cases are frequently met with in private practice, but seldom or never in hospitals; in private practice, and in institutions or retreats especially adapted to their necessities

they are found. And in the latter it is that they are best studied, being constantly under the eye of the attendant physician, who can watch the flitting by of each fugitive development, and enforce essential rules of hygiene and medication. And if there is any class of slow and tedious cases which need constant watching and advice, it is those who are afflicted with neurasthenia.

First, let us consider its etiology, immediate and remote. Austin Flint says that "it proceeds from undue functional activity of the nervous system, as connected with the exercise of the intellectual and emotional faculties." That is undoubtedly true in nine-tenths of the cases, and yet functional debility occurs just as surely from a lack of activity as from its antithesis. Nevertheless, it is with those of the former class with which we have principally to deal, as they are the most urgent in their needs and most pitiable in their condition. The immediate cause in the great majority of cases is worry—worry connected with business matters, or excited by domestic complications. Another large class is that suffering from sexual exhaustion, caused by excessive emissions or inordinate sexual gratification, or even lack of the same. Then comes another contingent, who actually overwork. I say actually, for the reason that simple overwork produces nervous exhaustion far less commonly than is generally supposed. Overwork is nearly always associated with worry and apprehension, that robs sleep, and the nervous system being deprived of its recuperative interval, there comes a time when the bank, to continue the figure first used, suspends payment. And yet overwork undoubtedly produces a not insignificant number of the cases of neurasthenia. Students and professional men who labor late at night, thus again curtailing the hours devoted to brain rest, are among the number who suffer in this way.* Again, nervous exhaustion is caused by emotional excesses, such as prolonged and profound grief, and undue excitement; especially in individuals in whom the emotional nature is very marked and predominant. Indeed, nearly all cases of neurasthenia occur in persons of the ultra nervous temperament, and in neuropathic families in which psychosis, hysteria, and other well known neuroses are familiar guests. It is more common among men, as they are much more subject to the first named causes than the opposite sex. It seems that anything which will lower the physical tone exerts a predisposing influence to this affection, and, as before remarked, simple inaction, when associated with the neurotic type, occasionally leads to asthenia of the nervous system.*

The immediate cause of this malady is usually comparatively easy to arrive at, but the remote cause, and why it should acquire a peculiar local or American prevalence, is, perhaps, not so easy to determine. In America industry is stimulated by vast opportunities. The competition is not, perhaps, so keen as it frequently is elsewhere, but with illustrious examples of intellectual and commercial success before his eyes, the average American cannot resist thinking he may attain to the same likewise. It is constant push, and drive, and energy, until the poor machine gives out. Who is so active and indefatigable as the American merchant, the American editor, artisan, scientist or professional man? Here everything, as Charles Matthews says, has got to be done in twenty minutes. But who shall say that our boasted opportunities and broad avenues to success are not a curse instead of a blessing, if they bring this terrible visitant to our door—are not as fatal to our health and happiness as the fabled gift of Midas. American ambition has worked out a typical, ambitious, American face; it has evoluted a new physiognomy. You see it everywhere; it is as familiar as Brother Jonathan, and the platform lecturers will tell you all about it. It is the sunken, restless eye; it is the elongated, sallow face; the hollow, nasal voice. Webster, Calhoun and Lincoln wore this typical mask, which bespeaks too truly the morbid condition which lurks behind. America is young yet; she is a precocious child, with too much cerebrum and too little biceps. By and by she will settle down into the assured good health of maturity, and the blissful satisfaction of elderly complacency.

I had desired to say a word about climate in this connection, but will omit it, through lack of time, and proceed to the consideration of the

Symptomatology. Neurasthenia is very properly divided into cerebrasthenia, or exhaustion of the encephalon; and myelasthenia or spinal exhaustion. These conditions are many times found with amazing distinctness of definition,

* The great observer of human life and nature speaks thus:—

"Sweet recreation barred, what doth ensue,
But moody and dull melancholy,
(Kindsman to grim and comfortless despair;)
And, at her heels, a huge infectious troop
Of pale distemperatures, and foes to life?
In food, in sport, and life preserving rest,
To be disturbed, would mad or man or beast."

Comedy of Errors—Scene 1*st*, *Act* v.

* Neurasthenia has an important relation to social grade, being seldom found in the lower stratum of society.

but usually more or less blended, and frequently complexly mixed. Their causes are usually different, and their treatment likewise differs much. They will, however, be more especially considered under the heads of diagnosis and treatment, and we will now content ourselves with a general consideration of symptoms. On examining these cases, the condition found is that of an overworked brain and nervous system, or, at least, a state of neurotic debility, and the resulting symptoms are such as would naturally arise from such a condition. Thus, prominent among the earlier indications is a marked degree of

Confusion of Thought. A business man is astonished and amazed that his head is not as clear as is its wont. He cannot think consecutively upon any subject, and is soon involved in a muddle, both profound and inextricable. There may be times when he can think clearly, but he is never sure of himself. At first the confusion may only be slight, but it soon increases, and may settle down to a chronic state of chaotic thought and indistinct ideas. The individual afflicted is perfectly conscious of his or her condition, and usually grieves and mourns over it, striving to rectify it by will power. But it is beyond the control of volition, and the unwilling brain cannot be forced to do its half performed duty. This symptom is quite universal in these cases, although instances of pure myelasthenia occur, in which intellectual ability is not perceptibly diminished in quality, although, perhaps, in quantity. Thus, I am familiar with a case which is capable of but a very limited amount of physical exertion of any kind, and yet is bright and quick in thought, and decides business matters of considerable moment with comparative ease and correctness. Others, on the contrary, with whom I have come in contact in the course of my professional life in Strong's Institute, not unfrequently, could walk many miles without discomfort, and perform acts requiring much physical exertion, and yet were totally disqualified for mercantile or professional life. Coeval with confusion of thought, and associated with it, loss of memory makes its appearance.

Defective Memory is incidental, of course, to all forms of debility connected with the nervous system, whether it be from exhaustion, from organic change, or from senility. It is not, therefore, distinctive of this affection, although from its relation to the immediate causes its association is significant, and it serves to distinguish the progress of the disease with tolerable accuracy. Loss of memory embraces names, facts, incidents, words, and side issues in conversation. It varies from time to time, and in certain lines of thought. Closely connected with the preceding two symptoms comes

Hesitancy in Speech; resulting not so much, I should judge, from deficient control of the vocal organs, as from the confused thought and bad memory just mentioned, rendering it difficult to form a clear conception of the subject under consideration, and hard to summon up the words to express it. It is not by any means so universal as the preceding two symptoms, and yet when found is frequently well marked. I recall a case now under observation at the Institute. When the individual first came under our care the hesitancy and stammering were absolutely painful. If a little embarrassed, it was still further increased. It was entirely beyond his control, and improved as his condition improved. He is a man of fair intellectual qualifications, and still when the simplest question was under discussion this phase of his malady manifested itself most annoyingly. He assures me that when in ordinary health he is never troubled in this way.

Indecision is also a marked characteristic. I recall an instance in which nervous asthenia had been brought on by overwork and care, in the person of a brilliant Presbyterian clergyman. Ordinarily he was a man of excellent judgment and firmness of purpose, but while suffering from this malady he betrayed a child-like lack of confidence in his own reasoning powers, and would vacillate from one purpose to another. Indeed, *timidity* and *lack of confidence* is very commonly met with. The degree to which it extends is forcibly illustrated in the case just mentioned. He told me that one day, while still in charge of his church, one of the members of his presbytery came to him and said, "How is it, Brother M., that whereas we always used to come to you for advice and counsel, you now always come to us?" He had no answer to make.

Depression, sometimes accompanied by an unnatural irritability, is almost invariably associated with this affection. I very much doubt whether a true case of cerebrasthenia ever existed which was not more or less affected by depression. It comes on very early in the history of the disease, and may be more or less permanent during its course. At first the attacks are usually of but brief duration, and during the intervals the individual may appear quite normal. Gradually the intervals are less and the depression more constant, until an almost chronic state of morbid moroseness and *melancholy* is sometimes attained. This may eventuate in confirmed *hypochondria*, or re-

verse its mode of progression, and gradual improvement take place. Such is the usual history. The attacks of depression sometimes last many months, and again, but a few hours. All the symptoms are usually worse during its existence. In one of the cases which I have studied the attack would sometimes last five months, and recur again a few days after its disappearance. I have remarked that the other symptoms were usually worse during the state of depression. At this time a vague apprehension and morbid fear of things frequently appears. If financial matters have brought on the difficulty, the spectre will usually be one of financial ruin and shipwreck, although perhaps there may not be the slightest foundation for the apprehension. If it is domestic infelicity, it may take the form of personal persecution. In fact, the condition is but the incipient stage of similar features found so frequently in mania and melancholia. I have never known actual hallucination to exist, unless the case had transcended the limits of simple neurasthenia, and entered the boundaries of determined insanity. It is during these states of depression that confusion of thought is the most marked. It does not appear to be from lack of ideas, but simply because of deficiency in the coordinating power over them. Ideas are abundant; crowds of half-formed conceptions wander through the mazes of the brain, with no one to say them nay, or regulate their order and movement. They, therefore, think to no purpose; lose confidence in themselves, and are timid, and nervous, and apprehensive.

Restlessness is also a symptom usually well marked. The depression may, or may not, be of the brooding type, although self is very apt to be the subject of thought. Sometimes they wander persistently from one place to another, and can only be lulled to rest by catching the attention and holding it with some light, trifling subject, or by reading an inconsequential story. In many cases however, it has not reached this degree of development, and but little is seen of this symptom.

Insomnia, however, is an almost unfailing accompaniment. It often long precedes the disease itself, and persistently clings to it during its course. It is one of the most annoying of its features, and stands in the relation of being an immediate cause, and during the course of the malady often the most serious enemy to recovery. If good sleep can be procured, it is not usually hazardous to predict a speedy and permanent convalescence.

(To be Continued.)

DIPHTHERIA AND ITS TREATMENT.

Read before the Linn Co., Oregon, Med. Association, Nov. 14th, 1878,

BY J. LINSEY HILL, M.D.

There has probably been no other epidemic disease so general and so fatal throughout Europe and the United States for many years past as diphtheria, and like all other diseases attended with great fatality, it has furnished a theme for all kinds of speculation, both respecting causation and treatment.

We probably know as little of the cause of diphtheria as we do of many other hidden mysteries in medicine, unless we acknowledge its origin to be from numerous sources. And it would also appear that we are in equally as great confusion respecting its cure, when we glance over the many different views held by physicians. To undertake to enter into a lengthy discussion as to the cause or treatment would not be practicable at this time, but I will simply say that from what I have seen, it appears to have its origin in some peculiar poison in the atmosphere, and under certain conditions of the system to be highly contagious.

Why I take it to be atmospheric is, that, as we have all observed within the last few years, it has passed through the country in narrow lines, usually, but not always, seeking elevated sections of the country, and after sweeping everything before it within a given space of a few miles in width, passes on in its circuit to other parts, without spreading generally on all sides.

As to its being contagious or infectious, we have abundant evidence, in children living in non-infected localities taking it shortly after being taken into the presence of those suffering with the disease.

But what I mainly want to speak of to-day is treatment. I have tried the iron and quinine treatment, the chlorine mixture, the alcoholic, mercurial, iodides, etc., accompanied by many different external applications, and have finally arrived at the conclusion that the more alcohol, tinct. ferri. or muriatic acid, no difference what the combination may be containing the acid, that is introduced into the system of a diphtheritic patient, the less are the chances for recovery; and quinine I regard as of very doubtful benefit during the active stage; while iron is more injurious than otherwise—the carbonate least of any, and the tincture most injurious—during the actual progress of the disease. During the time diphtheria was raging with such fatality in the adjoining counties of Benton and Polk, I had a tolerably fair chance to test the virtue of more

plans than one of treating such cases, and since that time we find it playing around our own city, to some degree, every few weeks.

We will all acknowledge diphtheria to be a constitutional and not an entirely local disease, consequently the constitutional treatment is of first importance. After having gone through with the programme above indicated, I have adopted as the only satisfactory constitutional treatment that I have ever used, chlorate of potassa and sulphate of soda, alternated in large and frequently repeated doses. I pay but little attention to age or size of the patient, but aim to get the system saturated with these articles as soon as possible, and keep it so until the disease shows unmistakable signs of giving way. And if I were compelled to accept only one of these remedies, I should give sulphate of soda the preference, by far. I have never had material trouble in a single case, to my recollection, where I pushed the sulphate thoroughly. I have treated cases with iron, and the chlorine mixture, where I became satisfied that the treatment was inciting the disease to greater activity, and when they were discontinued and substituted by sulphate of soda and chlorate of potassa, given in water, without stimulants or tonics, the malignant and inflammatory character of the disease soon showed evidence of abatement.

I am aware that many worthy members of our profession are strong advocates of the stimulant course of treatment, and would, of course, stand in antagonism to the course that I pursue, but since I have given their plan a thorough trial, and with as great anxiety that it might prove availing as I ever did the course that I now adhere to, and found it to fall so far short of what I had expected, I think I am fully justified in severing friendship with it.

Another article that many find fault with I believe to be in many cases deserving of unbounded credit, to wit, mercury. There are some cases that would doubtless terminate as favorably without its use, just as there are cases that would terminate favorably without a dose of any kind of medicine; but there are other cases, and they numerous, in which I believe the administration of calomel to be almost indispensable. The prejudice that exists against mercury, through the ignorance of the laity, stimulated by homœopathy, eclecticism and other shallow-pated quackery, has often, too often, I am free to confess, caused me to desist from its use, where my better judgment rebuked me for it, and not until the most pressing urgency of the case demanded it would I resort to it. Such has been my experience with it in a number of cases of diphtheria, and if I have any blame to attach to myself respecting mercury in the treatment of diphtheria, it is that I have been too sparing in its use. I do not remember ever to have given a dose of calomel in a diphtheritic case, where there were the least indications for its use, without being rewarded with beneficial response from it.

We next come to local treatment. Externally I have no faith in anything whatever that I have yet tried, except dilute tincture of iodine, sufficiently diluted that it can be frequently applied without excoriating. I think it may be absorbed in sufficient quantities to reduce the glandular enlargement. I have never derived any benefit from poulticing.

With many, the warfare against internal local applications is more vigorously prosecuted than it is against mercury. I have treated cases in this respect, pro and con, and am constrained to believe that the majority of severe cases are more speedily brought to a successful termination by local applications to the internal throat than by their neglect. Cases of a mild type need nothing of the kind, but where the diphtheritic, fungoid growth is extensive and deep, sufficiently to partially obstruct breathing, I see no good reason why we should not remove it with the same promptness that we would remove any other foreign substance from the air passages or extra granulations from an external ulcer. It is said by some that it is only worrying the child to remove the false membrane, for it will return, to be removed a second, third or fourth time. I will admit that it will continue to return until the disease is removed from the system. It is only worrying a child to give it quinia to break up the ague, with a fair prospect of its return, unless the remedy is persevered in for a time. It is, indeed, worrisome, and to say the least, very unpleasant, to take medicine to abort an attack of asthma, with almost a certainty of its return in due time; but should this deter us from giving present relief? With one accord we say no. It is evident that many children's throats have been permanently injured by the injudicious use of caustics, but that does not at all signify that the judicious use of them might not be beneficial. My plan has been to make a mild caustic solution of argenti nitras or tincture ferri chloridi, and apply it with a feather or probang sufficiently thorough and often to remove the false membrane, and then stop till it *does* re-form. I fail to see where the throat is injured by making an application to a foreign substance

in it, inasmuch as that foreign substance must become detached eventually and be thrown off, provided the patient can outlive the disease. It has also occurred to me that to continue to breathe through a rotten, putrid, poisonous mass might prolong the disease beyond its intended time.

The above is intended to apply to ordinary, malignant, uncomplicated cases of diphtheria. Such I have uniformly treated according to the plan just given, successfully in every instance. But there is a complication in some cases that I shall not attempt to suggest a treatment for, as I am compelled to acknowledge an inability to treat it satisfactorily, but will ask an expression from other members of this society, respecting it, namely, diphtheritic croup—where diphtheria is plainly visible on the tonsils, and extends into the trachea. I have treated two such cases, unassisted, and those two died. I have treated several other cases, with the assistance of counsel, and they died. I have heard of many others being treated by different physicians, during the late epidemic, and have failed to hear of a single recovery, although there might have been recoveries that I did not hear of. I treated two cases that I thought were assuming the croupous form that did recover, but neither of them became positively croupous, and whether they would have, had they not received early and persevering treatment to prevent it, I don't know.

One of the cases that proved fatal under the treatment of another physician and myself had the benefit (if I might so call it, in view of the termination) of the steam atomizer, which appeared to give more present relief than anything else used, and I think life was prolonged a few days by it; but death finally ended the scene, as I think it almost invariably does.

Tracheotomy I have never tried, and from the history of cases given where it has been tried, in this and other States, the result does not seem to be very encouraging. I treated one case that, had the instruments been at hand, I should have operated upon, but by the next day I could plainly see that an operation, even if it had been performed early in the attack, would have been useless, because the membranous deposit continued to extend until the lungs were so positively occluded that, had the trachea been entirely relieved, the result could not have been different. The membrane here presented is probably half the entire amount that was expelled from the trachea during the spasmodic efforts to cough. [Here about half an ounce of the membrane was presented, in a vial of dilute alcohol.] This was thrown off at different times during the last two days of the little patient's sickness, and at one time the breathing became so much relieved that I had hopes of a better termination; but all hopes soon vanished when an asthmatic wheezing and heaving of the chest indicated the progress being made into the lungs. This state of things continued for about six hours, when the patient died from asphyxia.

I have never tried atropia in such cases, but from its known action on the air passages, in functional disturbances, and its tendency to dry the mucous membrane of the throat, I would have some faith in its being capable of drying the mucous membrane of the trachea to such an extent that the further tendency to develop the fungous growth might be stopped.

The inhalation of moisture, as steam, medicated and non-medicated, has been recommended, but on trial it fails to meet expectations; expectorants have been most thoroughly tested, without good results; tracheotomy cannot be relied upon, and if drying out the mucous membrane of the air passages as they become invaded will not prevent the exudation or growth, I have no knowledge of any rational treatment for it, and if any member of this Society has, he will confer a great favor by making it known.

[The members present answered, with one accord, that they had never known a genuine case of diphtheritic croup recover. I will further add that since writing this article I have had two other cases of diphtheritic croup, which resulted as before. In one of these I administered belladonna, but as the case was in a neighboring village, some distance from me, I was not enabled to press it as desired. If any reader of the Reporter knows how to cure it, I should certainly welcome the account of his treatment in the columns of the Reporter.]

A CASE OF TRAUMATIC (?) TETANUS.

BY C. G. SHIVERS, M.D.,
Of Haddonfield, N. J.

During the month of September, 1878, I was called to see Charles S., aged fourteen years, who was said to be "in fits." Upon examination, I found the pulse eighty; temperature normal; skin moist; bowels constipated; abdominal muscles tense and hard; tongue slightly furred; an anxious expression of countenance; mind clear, and, at varying intervals, spasms of the muscles, there then being marked opisthotonos and strabismus. During the existence of

the spasm the patient would sometimes snap at his nurse, and on one occasion bit him on the arm. The boy's parents could not remember that he had been wounded in any way; but remarked that two weeks before a strange dog had jumped upon him, without, however, drawing any blood. I inquired carefully if he was naturally nervous or easily excited; they replied that he was not. Upon offering him a drink of water I observed that the act of swallowing was not attended with spasm, and informed the family that, in my opinion, the child had idiopathic tetanus, probably caused by an accumulation of hardened fæces. I prescribed for him potassii bromid., gr.xxx, every hour; and pil. cath. com., No. v, to be taken at bedtime. My first visit was made about four P.M.

The next morning, at nine o'clock, I saw him again, and found he had passed a very restless night. His bowels had been freely evacuated; his tongue, skin and pulse the same as on the day before. The spasms were more frequent, and the least noise or breath of air brought on a paroxysm. Applied cantharidal blister to spine, and continued potassii bromid., with morph sulph., gr.$\frac{1}{4}$, every three hours, "pro re nata."

At six P.M. found the patient somewhat under the influence of morphia, but still very much distressed. Substituted for morph. sulph., pulv. ipecac com., in ten-grain doses, every three hours, omitting the potass. bromid.

On the morning of the third day the boy was more comfortable, having slept two or three hours during the night. Pulse ninety, tongue furred; bowels constipated. Continued Dover powder, and renewed potass. bromid., and ordered cold to the spine.

About dusk in the evening I found the patient much worse, the spasms coming at shorter intervals. The pulse was still under a hundred, and the skin was moist. I determined now to administer chloral in good-sized doses, often repeated, supposing the case would prove to be like all cases I had ever seen before—"*touts les cas sonts des morts.*" I administered to him, immediately, chloral, gr.xx, and left orders to give him a dose (gr.x) of the medicine every half hour until the spasms diminished in frequency; then to give it every hour until he slept; after which to awake him every three hours for his medicine.

On the fourth morning I was surprised to find the patient very much improved. He had slept continuously for four hours, being asleep on my arrival, during which time he had been free from spasm. He could be aroused, but was very sleepy. While counting his pulse I accidentally discovered a recent cicatrix upon one of his fingers, which, on inquiry, I ascertained to be the result of an incised wound, caused by a penknife some three weeks before. After this the patient continued to improve, and in a few days recovered. For four days the chloral was administered at intervals during the daytime, without producing any unpleasant effects.

Hospital Reports.

COLLEGE OF PHYSICIANS AND SURGEONS, NEW YORK.

CLINIC OF PROF. A. B. ARNOLD, M.D.

Cases of Insanity.

Gentlemen:—There are at present two insane patients in the hospital, who were admitted under the following circumstances: One of them, a young man, was brought here to be treated for a wound of the neck and a fractured thigh; the other, a woman, was admitted a few days ago, at a late hour in the evening. A police officer in the immediate neighborhood observed her behaving in a strange manner, and as she could not give an intelligent account of herself, she was sent to this hospital. These cases afford me an opportunity to make you acquainted with some of the features of mental disease, for although insane persons are generally assigned to the charge of specialists, or find their way into an insane asylum, still the services of the general practitioner are frequently called upon in recent cases. He must also be prepared to give his opinion in questions of mental competency, and decide upon granting certificates for admission into lunatic hospitals.

Subacute Melancholia, with Suicidal Propensity.

The history of the first patient whom you saw in the surgical ward was gathered from his wife, who has faithfully nursed him since he was admitted. C. T., 31 years of age, had typhoid fever in his early youth. His father was a confirmed inebriate, and had been the cause of much misery in the household. On his death his widow was left in very reduced circumstances, and with a family of young children to support, in which she was assisted by her eldest son, our patient. His failing health induced his mother to send him from home. He found employment in a mercantile house, in Buffalo, where he was much liked for his steady habits and devotion to business. At the age of 25 he married. Some time in October, 1876, his wife noticed an alteration in him. In place of being of a cheerful and lively disposition, he became downhearted, morose, and silent in company; he slept little, frequently refused to eat, said he felt miserable, and sometimes wept like a child, without assigning any satisfactory reason. This depressed condition gradually deepened, so that his employers found complaints against him, on account of his neglect to attend to his duties. It was finally

ascertained that our patient was subject to various delusions. He says that he feels a ball rolling up and down in his spine; his marrow is rotten; something dreadful is about to happen to him; he does not feel like other people; has lost all confidence in himself, and finds it impossible to do anything right and proper; he hears voices that tell him he is lost. One day he was missed from home and from his place of business, and about two weeks later his wife received a despatch from Chicago to come on and take care of her husband, who had been attacked with a serious illness. His wife brought him home to his mother's house, in this city, where he made several attempts to commit suicide. The last attempt was the most desperate. While sitting at the dinner table he suddenly snatched up a carving knife, and inflicted an extensive, but not a dangerous, wound across his neck. He succeeded in escaping from the hands of the persons who tried to secure him from doing further mischief to himself, and then, springing through the doorway, he leaped over the balustrade and fell to the floor below, a distance of nearly thirty feet. He was there found in an unconscious condition, and on examination, it was discovered that he had broken his leg.

The patient is evidently anæmic, there is a dejected expression of the face, the skin is cool, and the pulse has little force. His delusions partake now of a religious character. God and the angels tell him that he is unfit to live; he is the incarnate devil, but he cannot understand why he should be chosen for such an unhappy fate; he knows that he caused the great fire of Chicago, and the late civil war, etc.

This is a typical case of that form of insanity which is commonly designated melancholia. The distinctive symptoms of this mental disease in our patient are well marked. It commenced with a depressed state of the mind, that is manifested by undefined feelings of uneasiness, dread and wretchedness. There is reason to believe that the whole mental sphere of the melancholic is overshadowed by the dark gloom of his morbid sensations. His wailings and complaints solely refer to his own person, and thus reveal an exaggerated state of self-feeling. Even the most ordinary events of daily life affect him with displeasure; while the most exciting occurrences that do not directly concern him cannot swerve him from his indifference. Gradually these vague, distressing feelings take a more definite shape. The dark forebodings settle into some fancied realization; or the mental disturbances suggest a horrible meaning; or a popular belief is fixed upon in explanation of the cause of suffering. Whatever these false notions may be, they develop into delusions which henceforth control the language and acts of the melancholic. The principal delusion in our patient was probably influenced by the sense of hearing—he heard "voices." Alienists tell us that this kind of hallucination is prone to develop suicidal, and less frequently, homicidal propensities.

Although it is a precarious undertaking to analyze the psychical processes that take place in the brain of an insane person, with the object of determining the motives of his conduct, it may, nevertheless, be hazarded in the instance of our patient, to intimate the probable mental operations which resulted in his mad acts. His flight from Buffalo may have been an effort to escape from his mental torture by a change of residence, and his attempts at suicide originated either in a desire to put an end to his miserable existence, or were in obedience to the command of the "voices." But it is of far more practical importance to remember that melancholic patients are exceedingly disposed to suicide, and that this tendency is developed at a very early stage of their malady, when the symptoms of mental disorder are but little pronounced.

The prognosis of melancholy may be said to be very favorable. Experience has, however, established the fact that a great number of cases of insanity commence with melancholia and terminate in mania. Sometimes these forms of mental disease occur in alternate succession, and constitute the *folie circulaire* of French authors. Unfavorable cases of primary melancholia usually end in hopeless dementia. Improbable as it may appear, it has, nevertheless, been observed that a hereditary tendency to mental disorders does not lessen the chances of recovery, though relapses are common.

In the management of a case of melancholia, it is absolutely necessary to take measures against the possible suicidal inclination. If the means of the patient are not sufficient to defray the expense for the care and watching he needs, nothing else is left but to send him to an asylum. You must not yield to the arguments of his family or friends, that he is only "low spirited" or "out of sorts." The community is frequently shocked by accounts of suicide which might have been prevented by timely precaution.

No general rules can be laid down for the treatment of melancholia. The chief indications refer to the state of the digestive organs, the functions of sleep and the mental symptoms. Our patient required mild laxatives to correct his foul tongue, offensive breath and constipation. Drastic purgatives must be avoided, for this class of patients usually present the signs of general debility. Considerable difficulty was experienced in feeding this man, as he frequently refused to take his meals, which consisted of easily digested articles of diet. Moderate doses of chloride always produced undisturbed sleep, but had no influence in quieting his incessant allusions to his fancied troubles during his working hours. Tepid sponging seemed to allay this "mental pain."

Acute Mania—Hereditary Predisposition.

Those of you who have watched the insane girl in the woman's ward must have observed a marked contrast between the character of her mental disorder and that of the melancholic patient I have just described. Her father informs us that this is her third attack within the space of two years. She is twenty-four years of age, menstruates regularly, and with the exception of these repeated attacks of insanity, she had always enjoyed excellent health. An older brother is now confined in an insane asylum, and an uncle, on her father's side, committed suicide. The first outbreak in her case came on rather

abruptly, and was of an extremely violent character while it lasted. The second was more prolonged, though not so severe. Six weeks ago her family noticed some signs of a recurrence of an attack. She became indifferent to her household duties, frequently remained in bed beyond the usual time, spoke little, appeared to be absorbed in thought, and when reproached on account of her singular behavior she answered with a sigh and tears. After having continued in this state for several weeks she began to become boisterous, unruly, abusive, and incoherent in her language. A separate room in the hospital had to be assigned her, as she conducted herself in an outrageous manner, was extremely noisy and mischievous, though she sometimes conversed quite rationally and seemed to know what she was doing. Occasionally she would shout and sing, or get into a furious passion, that rendered her almost unmanageable. No particular hallucination or delusion could be detected in her case. Her general health has not suffered; her appetite is tolerably good, but she sleeps little.

Let me draw your attention to the striking difference between the psychical condition characteristic of melancholia and that of acute mania. In the former there is a primary morbid state of the feelings which secondarily reacts on the intelligence; in the latter, the intelligence is primarily affected, and vitiates more or less all the other mental activities. The symptoms of acute mania obviously indicate a condition of excitement, but you must not hastily infer from this the existence of a cerebritis. There is a variety of acute mania, generally occurring in young persons, and marked by a short duration, in which the mental excitement is far more intense than in our patient. Systematic writers speak of it as an "acute delirious mania." It is not unfrequently diagnosed by the inexperienced as brain fever.

The prognosis of acute mania is not bad, but the opinion must be modified by a number of considerations. For instance, young persons are more apt to recover than elderly people; the presence of complications, delusions, or hallucinations, and especially a prolonged duration of the malady, lessen the chances of a cure. The hereditary predisposition in our patient is unmistakable—her family, on the father's side, being saturated with insanity—nevertheless, she promptly recovered from former attacks. In a certain proportion of cases of acute mania a cessation of the more acute symptoms takes place, and the residue of disordered intelligence takes on the character of fixed ideas, resembling that form of mental aberration which is simply termed mania. The latter constitutes a group of mental disease which alienists, whether correctly or not, have divided and subdivided into numerous species, sometimes on clinical and sometimes on supposed etiological differences. Great difficulty is experienced in managing persons affected with acute mania outside of an insane asylum. Among the most reputed medicines to procure sleep and allay the mental excitement of maniacs, chloral and the bromides take the foremost rank. The hypodermic injection of morphia is now much practiced in the treatment of these cases, on account of the easy mode in which the drug can be introduced in patients who usually resist the administration of internal medicines. Digitalis is an old remedy, and is often serviceable. Our patient has derived considerable benefit from its use, in doses of 20 drops, three times a day.

Medical Societies.

COLLEGE OF PHYSICIANS, PHILADELPHIA.

At the regular meeting of the College, on March 5th, Dr. Addinell Hewson described a case of

Immense Abdominal Tumor,

the progress of its destruction, as shown by its history, post-mortem and microscopic examinations.

Miss H. S., a tall blonde, with blue eyes and brown hair, was induced by one of her friends in Philadelphia, who had been cured of an abdominal tumor of some size, under my care, to seek my services, in October last.

I saw her for the first time on Sunday morning, October 20, at a relation's house in this city. She was propped up in bed, suffering with much dyspnœa and exhaustion, and with her tumor so large and projecting on her thighs that she could not see her knees. The integument covering this growth in its lower portion (from the umbilicus down) was in a state of marked hypertrophy (like that of elephantiasis), and in singular contrast with the blue attenuated skin above the umbilicus; this hypertrophied skin was weeping freely a watery fluid, so constantly that it had been impossible to keep her dry, or to prevent excessive excoriation and itching; the distention of this portion of the skin had been such as to cause a hernial protrusion in each iliac region, and the whole projecting forward made it impossible for me to reach the vulva by the full length of my forearm. Her vulva was excessively œdematous.

The patient had no difficulty with either her bowels or bladder, save frequent micturition from the latter. The day that she came to Philadelphia she was weighed at the depot; this showed that she had gained in weight during the past six years fifty-eight pounds, in spite of the decrease in size of her limbs and chest, for she weighed just before the tumor began to grow 107 pounds, and now 165 pounds. Before starting on her journey she measured herself around, at the navel, and found her circumference there to be 54 inches. I made no attempt at a critical measurement or examination on my first visit (October 20th), but simply made a complete covering of the tumor with a paste of clay and water, one and a half pounds of the former to three-quarters of a pound of the latter, retaining it in the usual way with a thin layer of cotton batting. With this she expressed considerable satisfaction; she slept better that night than she had for a long time, and I found her the next morning, still propped up in bed, but very comfortable. When I removed the dressing, on account of its having

been much broken, as is usual at first in these cases, she complained of the want of the support it had afforded, and especially of a dragging sensation in front, from the ribs on the right side. Percussion yielded positive dullness up to that point, with very marked resonance above, on the left side, under the excessively expanded thorax; tracing this resonance on the left side, I could follow it down on that side of the tumor into the iliac fossa. I was also able in the same manner to detect the beginning of the colon, on the right side, but it was evidently much pushed up. The walls of the belly on either side fell over so much as to make it difficult to determine the points of the anterior superior spinous processes.

This examination evidently fatigued the patient, and I desisted from pushing it further. Its effect suggested to me to inquire of her mother as to her ever having suffered with symptoms of a hysterical character; to which, as I expected from her courageous conduct, I got a negative answer. This was satisfactory as to the location of the tumor. They further stated that she was wearing constantly a large sponge in the vagina, to prevent protrusion there. An examination of her urine, which had been saved by my direction, showed it to be free from albumen, but heavily loaded with phosphates.

I then renewed the dressing, using the same quantity of clay and water, the same covering of cotton wadding, and as a supporting bandage a four-inch roller around the waist, and a loop of the same breadth fastened to this waistband, well back in the lumbar region on both sides, after having been carried under the tumor close to the symphisis pubis. As the patient's appetite was good, and as there were no signs of indigestion, I allowed her freedom as to her diet, and ordered a slight use of stimulants.

On the next day (October 22d), I found her still more comfortable; had been less disturbed by micturition during the night, and was lying quite comfortably in bed, less propped up, and somewhat over on her right side. She seemed so much better that, after I had removed the dressing, I made a further examination, including deeper explorations by percussion, and a thorough series of measurements with a strong, broad, tape-measure.

On the 22d and 23d, the table, which I preserved, of her measurements, showed a most positive diminution, especially of those which related essentially to the tumor itself; thus, on the 23d she was found to measure 3 inches less around the umbilicus, 2 inches less from symphysis to umbilicus, 3¼ inches less around the waist above the umbilicus, etc. (This table shows two omissions on the 23d; these were made by my scribe on the occasion—the mother of the patient—who was so delighted with the changes which had been produced that she omitted these while expressing her delight, and I did not know this fact until it was too late to remedy the omission.) The patient continued to improve in this way steadily, so that in two weeks all the major measurements had diminished, each about 4 inches (some of them 3½ and others 4¾). She was then walking about her room, sleeping comfortably on both sides, but preferably on the left, and even dressing herself with a silk dress which she had not before been able to make meet on her person for more than two years. She was confident of her complete recovery. During all this time she never took any anodynes or medicinal remedies, save what was necessary to move her bowels twice in the week, pills of rhubarb, aloes, etc.

On the 16th of November she ventured out in a street car, not going very far, however, the first time; this done her no harm, but, on the contrary, she measured less on the 18th than ever before. I was now visiting her at intervals of three or four days, her mother renewing the dressing, if required, in the *interim*. Her improvement continued steadily; she got to walking on the street, and I visited her about every four days, making, as the table shows, the same form of measurement, with not so great a decrease as was noticeable at first. During the Christmas holidays she walked over nine squares on Chestnut street, and became so exhausted as to be compelled to go into a store for rest. A day or two after she noticed some œdema in her right foot, with scanty urine; the latter was tested by me, and found free from albumen. She from this time grew weaker, notwithstanding the free use of stimulants and fluid nutriment, and finally sank, from exhaustion, on Saturday, February 1st, at 12 P.M. The last measurements were taken at her own request, on January 27th, four days before her death. They showed no material increase of the growth, the little difference being readily assignable to her increased weakness. The autopsy showed fibroma of the uterus undergoing cystic degeneration. The tumor and fluid removed at the autopsy weighed 47½ pounds.

Cases Illustrating the Use of Koumiss.

Dr. Jas. Thompson briefly reports the following cases in the *British Medical Journal*:—

Case 1.—E. G., a lady, aged 45, bedridden for the last five years with an abdominal tumor, suffered much from sickness, retaining food with difficulty. She gradually wasted extremely. Koumiss was prescribed, a wineglassful every two hours. This was retained without discomfort, and for several days no other food was given; then small quantities of farinaceous food were added, and a marked improvement took place in her appearance, which continued to improve until she became better than she had been for years before.

Case 2.—S. S. S., aged 28, had phthisis of several years' duration, and was much reduced by copious hæmoptysis and hemorrhoids, bleeding freely. He derived the greatest benefit from a bottle of koumiss daily, and soon improved in weight, and is now more than twenty pounds heavier than he was before.

Case 3.—H. B., aged 22, suffers from severe dyspepsia, often dreading to eat anything. During this last term he was at Oxford college, where the food is often of an inferior description. In ten weeks he lost two stones in weight and was reduced to a skeleton. I advised the use of koumiss and a good digestible diet, and in ten days he increased seven pounds in weight; the improvement gradually increased, at the rate of four pounds a week, and at the same time great improvement in the dyspepsia. He continues to improve, and will soon be as well as before.

Case 4.—A. F., aged 23, was confined to the sofa by a spinal disease, and could not eat anything. Koumiss was prescribed some time since with great benefit, and her improvement was most marked; she almost lives on it, and if she miss a day she falls off appreciably in appearance.

On Aconite as a Therapeutical Agent.

The following remarks are taken from an article in the *Practitioner* by Dr. J. S. Spark:—

The first disease to which I shall direct your attention, in which I have seen illustrated the abortive power of aconite, is pneumonia, and if it were the only affection which aconite could not only control, but also cut short, its gravity is such that we should be warranted in giving the drug a prominent place in our pharmacopœia. If administered within a day or two after the symptoms are apparent enough to render the diagnosis certain—but, of course, the earlier the better—it will arrest the inflammation and effect a cure in from one to three or four days, the beneficial effects being manifest from the very commencement of its administration. The pain frequently begins to subside from the first, the skin becomes moist, the breathing more natural, and the patient appreciably better and more comfortable after each dose. I have used it frequently, both in children and adults, and have never seen it fail to produce most satisfactory results. The dose I have generally employed for an adult is five minims (Fleming's tincture) at first, and one or two minims every hour after, modifying the dose according to circumstances. If the patient be debilitated from any cause, it must be prescribed cautiously, as I have seen it cause considerable alarm by producing delirium; nor are the beneficial effects of the drug any more, if so much, seen when it acts too powerfully.

I have not had sufficient experience to speak positively of its action in bronchitis, but so far as I have seen, it does not appear to exercise the same control over it as over pneumonia. I have, however, found it useful when there is much feverishness, with fullness of the head and flushing of the face.

In cynanche tonsillaris I have found it exceedingly useful, both as an abortive and as a controlling or modifying agent. If properly administered during the inflammatory stage it will seldom fail to cut the attack short, and if given at the very beginning, to abort it. If duly administered, it not only cuts short the present attack, but after a time it seems to reduce or remove the liability to quinsy, in persons subject to periodical attacks of it. It would take a considerable deal of evidence to establish this last fact, but I have seen it sufficiently often to warrant my referring to it.

Its use in fevers, especially in those of an inflammatory character, has been found very advantageous. It reduces the temperature, and produces a very soothing effect from its action on the skin. Whether it will act as an abortive in such cases, or not, if given sufficiently early, I have not yet ascertained, but have every reason to believe it would.

There is no doubt of its efficacy in erysipelas, especially in that form which is occasionally consequent upon vaccination, which I have seen it cut short in a few hours.

We have no better illustration of the efficacy and rapidity of the action of aconite than in common cold, "cold all through one," or "cold in the bones," as it is variously popularly described, when one feels as if he had been put through a thrashing mill." Ringer (I think) states that one or two drops taken at bedtime will enable a person in such a state to rise quite well in the morning; and certainly in the doses I have mentioned it affords very speedy relief.

It relieves that disagreeable affection, ringing in the ears, in many cases after a dose or two, and is said also to remove earache.

In the acute stage of gonorrhœa, when there is much pain and uneasiness, it affords marked relief.

The Diagnosis of Vaccino-Syphilis.

Dr. Hugh Thomson writes on this subject, in the *Medical Press and Circular*—

How is vaccino-syphilis to be recognized? What are the diagnostic marks? The description just given gives a fair idea of them. We are not to imagine every troublesome sore which follows vaccination is syphilitic. It would lead us too far away from our present subject to describe the various causes and characters of post-vaccinal affections, many of which are not due to the lymph used in vaccinating, but to the previous health of the individual vaccinated. The vaccination has only played the part of a common excitant in developing the phenomena in question.

The features presented by so-called vaccino-syphilis do not differ materially from those of syphilis inoculated in other manner, from the products of secondary symptoms. There is the same lengthened incubation ere the initial symptoms appear, the same variableness in the character of these, and followed, after a time, by the same secondary or constitutional symptoms, as they are called. Where it has been accurately observed, the period of incubation is found to be from three to four weeks, exactly the same as occurred in experiments performed with the view of testing the inoculability of the products of secondary symptoms on healthy subjects. About the

time that the crusts of vaccinia fall, that is, at the end of the third week, the cicatrix becomes irritable, slightly inflamed, and hardened. In most cases it becomes ulcerated, while in others it remains in the dry state, covered by a thin crust or scab, its size ranging from that of a pin to that of a shilling, upon a hardened base of variable extent, and of dusky hue. In some cases the vaccination sores appear to open afresh, or they have not quite healed, and remain in that condition for several weeks. They have even been known to become phagedenic—much, no doubt, depending on the previous health, as is also observed when syphilis occurs under other conditions.

The glands of the axilla usually at the same period become engorged and slightly painful, with little or no tendency to suppurate. After a few weeks more, the glands in other localities, especially about the occiput and groins, swell, and are accompanied by other indications of derangement of the general health—slight fever, syphilitic roseola, symmetrical ulcers in the throat, mucous patches and condylomata in the mouth and near the anus, syphilitic lepra, iritis, and all the various forms of secondary symptoms.

On Night Cough.

Dr. R. E. Thompson says, in the *Practitioner*—

There is a very persistent and harassing form of cough which accompanies many forms of pulmonary disease—phthisis, bronchitis, and others—which appears to be an undeveloped, modified form of asthma.

The patient complains of being much disturbed, at night especially, or early in the morning, and it is generally worse when the patient lies down and goes to bed. No narcotics in ordinary use for cough appear to have any effect, and it is only by asthmatic remedies that any relief is obtained. Many cases of this kind have now come under my notice which formerly used to trouble me not a little from the constant complaint that was made as to the distress arising from this obstinate night cough, and the ineffectual result of opiates. In all those cases of this kind which I have lately investigated, there was a decided history of inherited asthma; but it will be sufficient if I quote two cases out of the number.

A lady, who had been confined three weeks, consulted me about a very persistent and harassing cough which kept her awake through the night. For this various remedies had previously been tried, opiates chiefly, without the slightest alleviation. A year before this her younger sister had applied to me for advice for a fully developed asthma, which was treated successfully by asthmatic specifics. The remembrance of this gave a clue to the case, and investigation proved that asthma had been inherited from a grandparent, the father and mother of the patient having been perfectly free from pulmonary complaints. Relief was at once obtained by Joy's cigarettes, which are often extremely useful in like cases.

A young lad, aged nine, was brought to me for advice respecting a persistent cough with which he had been troubled since an attack of measles, eight months before. On examining him, I found a thickened condition of the alveolar tissue and harshness of respiratory murmur, which appeared to depend upon an old condition of broncho-pneumonia. I ordered him some cod-liver oil and lactuca for his cough, but finding that the cough was still very troublesome, especially at night, I conjectured that the case was one of undeveloped asthma, and on investigation I found that the grandfather had been subject to asthma. In this case the burning of nitre-papers removed the cough at once.

Late Suggestions on Ozæna.

Dr. Fränkel, in Virchow's *Archiv*, volume LXXXV, gives a number of cases which he thinks will confirm the views of those who believe that ozæna always owes its origin to a dyscrasia—two of his patients were phthisical, two syphilitic—but does not believe, though admitting the frequent coincidence of ozæna with pharyngitis sicca, that both the diseases are in causal connection with each other.

In an Italian contemporary, Dr. Massei, starting from the theory of a parasitic origin of ozæna, recommends the following treatment: *a.* Gradual dilatation of the obliterated nasal passages by means of elastic bougies; *b.* Cleaning and disinfection of the diseased regions by a very weak solution of salicylic acid (1 part to 500 parts of water), applied by means of a syringe; *c.* Modifying local medication, by blowing calomel powder through a nasal speculum on the ulcerated surfaces. The author says that there is always an arrest in the process of healing at a certain period, but advises strongly not to give up this treatment, but to continue it patiently until total cure is obtained.

In the *Memorabilien*, Dr. Dawosky describes his successful treatment of that form of ozæna called *punaisie* (in German, *stinknase*). He carefully removes all crusts, washes the mucous membrane with a two per cent. solution of silver nitrate, and every evening tampons the nostril with a plug of charpie as thick as the finger, moistened with glycerine and that thickly dusted with powdered alum. In the morning this is removed and the nostril washed with injections of permanganate of potash or zinc, in weak solution. The odor soon disappears, and by persistence a cure is effected.

Cold Water in Typhoid Fever.

Dr. Clement, of Lyons, employs a new apparatus for the cold water treatment of typhoid. The London *Medical Record* describes and remarks upon it as follows:—

It consists of a double-walled jacket of vulcanized caoutchouc, which is sufficiently long to cover the trunk, and sufficiently broad to allow of its enveloping the thorax and abdomen. It is provided with straps, to retain it in position. To prevent the weight of the body pressing the two walls together, India-rubber balls were fixed on the interior. Water was supplied to the jacket, from a tub at the bed head, by two pipes, and was drawn off by a single pipe into a tub placed at the bedside. The pipes were

furnished with stop cocks to regulate the rapidity of water. The temperature of the water was 18° or 20° C. The interval between the times of turning on the water was three hours, and it was kept running for 1½ to 2 hours, at such a rate, say to change the water in the jacket once in twenty minutes, as brought about a reduction of 1.5 to 2 C. Its application was not free from risk of chest complication, even though the patient was not directly wetted.

The value of a given plan of treatment is generally estimated by the result produced from the employment of that treatment. Dr. Clement says that his patients were admitted on the fourth or six day of illness, but we think he might alter four and six into eight and twelve. Our experience of cold water, quinine, etc., leads us to believe that if the so-called "antipyretics" are tried in the first fortnight of illness, the fever is probably beyond control, *i. e.*, the result obtained is not worth the trouble to the medical attendant or the suffering inflicted on the patient. In a disorder like enteric, in which the onset is generally uncertain, it is impossible to say, within a week, what is the date of the "disease," and in this way errors creep into statements made as to a particular plan of treatment. If Dr. Clement's patients were admitted on the fourth or sixth day, as he says, we should consider the epidemic severe, and the results good, even though three of the seven patients on whom this plan was tried did die. The moment the temperature shows signs of "marked remission or intermission," one can use with advantage almost any "antipyretic." Most systems for reduction of temperature are troublesome, from the amount of care called for in application, and can only be employed when assistants (*e.g.*, nurses) are perfectly trustworthy.

Treatment of Exhaustion from Sexual Connection.

In the *Practitioner*, March, 1879, Dr. F. P. Atkinson writes—

I have lately seen two cases which I think may be by no means uncommon. One patient came to me when the habit was already confirmed, and the result was, I am sorry to say, unsatisfactory. The other, before stimulants were regularly resorted to; and inasmuch as the treatment suggested gave decided benefit, that which would soon have grown into a habit was checked in its very commencement. Both patients were married men (one of moderate, the other of immoderate sexual desires); the symptoms in both were the same; and in both they were produced by the same cause. The chief symptom complained of was a sinking or feeling of void at the pit of the stomach, which they said nothing seemed to relieve but stimulants, and these very temporarily. At first, not thoroughly understanding the nature of the case which was presented to me, and thinking the cause was due to some ferment in the stomach, or sarcina, I ordered carbolic acid, hyposulphite of soda, and sulphurous acid, without the slightest relief being obtained from either. Finding, however, upon inquiry, that this feeling came on about three or four hours after connection, I judged that it might be the result of nervous exhaustion, and acting upon this supposition, I prescribed some pancreatic emulsion, some of Kirby's compound phosphorus pills, Bravais' dialysed iron, etc., but with only partial benefit. It subsequently struck me that feebleness of the heart's action (common to both patients) might possibly have some share in producing the symptom complained of, and I ordered forty to sixty drops of sal-volatile every four hours on the days when it occurred, together with large quantities of milk. The relief experienced from this treatment was very decided in the second case, and the reason of its being so is, I think, very clear. The milk and ammonia both supply food to the brain, and the latter is a good cardiac stimulant. From experience gained in these two cases, I should say that alcohol is decidedly injurious, and likely, if indulged in, to lead to serious results.

Digital Dilatation of the Os in Labor.

A paper on this subject was read at the London Obstetrical Society, by Dr. James Braithwaite. He commenced by calling attention to the frequency with which rigidity of the os uteri gives rise to exhaustion, before the real effort is required; also the occasional necessity for rapid dilatation of the os, in cases of puerperal convulsions and other abnormal states. In the mode of using the fingers as a dilator, which it was the object of the paper to explain, the right index finger is introduced within the os uteri, with its palmar surface toward the sacrum; the left index finger is then passed, with its palmar surface toward the pubes, the left hand crossing over the right for this purpose. By gentle pressure in opposite directions the os is readily made to dilate; the fingers being hooked within the os, the pressure is also made downward, thus very closely resembling the natural process. As soon as the os is dilated to the size of a five-shilling piece, two fingers of each hand can be introduced for manipulating. The author related the histories of four cases, in which he had by this method rapidly dilated the os to a size sufficient to enable him to apply the long forceps.

Treatment of Goitre.

The following instructive case is given by Dr. A. Shannon, in the *British Medical Journal*:—

John B., aged fifteen, railway clerk, suffered for several years from enlargement of the thyroid gland; but on December 23d, 1878, the symptoms became very much aggravated. Violent dyspnœa occurred frequently, and at night, for several weeks, was so severe that the patient was unable to go to bed or even lie down. His countenance expressed the greatest anxiety, his face was blanched and his lips livid, and, on inspiration, a loud musical note was produced. Owing to the tumor extending downward against and behind the top of the sternum, tracheotomy was considered almost impracticable, and any incisions to relieve the tension were also deemed inadvisable. A mixture of iodine and iodide of potassium had been given. Leeches were applied to the tumor, and it was also blistered.

Sulphuric ether, chloroform and other antispasmodics were tried, with but very slight effect. But it is to the great value of the inhalation of stramonium in this case that I wish particularly to direct your attention. A powder of the following formula was ordered, and a teaspoonful directed to be burned in the room when required: powdered stramonium, two drachms; nitrate of potash, one drachm; opium, one scruple. The use of this powder invariably gave the greatest relief, and although used frequently for more than a month, no diminution in the efficacy of the result was appreciable. I have often burned this powder myself, and always observed that, even before the teaspoonful was half consumed, the dyspnœa and loud musical note and lividity were greatly ameliorated. At present the tumor is diminishing in size and the patient is progressing favorably.

Retention and Incontinence of Urine in Children.

At a meeting of the Harveian Society, of London, Mr. Teevan made a communication on the above subjects. He would only look at each subject from its surgical aspects. Retention might be due (1) to congenital contraction of the meatus, which required surgical enlargement of the orifice; (2) to phimosis, where the preputial orifice might be very small; and (3) to stone in the bladder. It was more difficult to find a stone in the bladder distended with urine than when empty. Great care was requisite in sounding a child. Incontinence was due (1) to rectal complaints; (2) to a tight foreskin; (3) to a small congenital meatus; and (4) to a calculus impacted in the urethra. Causes 3 and 4 were usually not sufficiently attended to. Stone impacted in the urethra might cause retention or incontinence, according to its location. A stone so impacted did not cause so much pain and discomfort as might be imagined. He advocated a milk dietary and the use of belladonna in nocturnal, and strychnia and iron in diurnal, incontinence.

Reviews and Book Notices.

BOOK NOTICES.

On Diseases of the Abdomen, comprising those of the stomach, œsophagus, cæcum, intestines, and peritoneum. By S. O. Habershon, M.D., London, etc., with illustrations. Second American from the third English edition. Phila., H. C. Lea, 1879. 8vo, pp. 554.

The English edition, of which this is a reprint, has received the careful revision of the author, and several new chapters have been added. The spirit in which the author writes is an unusually broad one, and he takes pains, in all instances, to point out the general relations of the diseases he describes. He also includes several, such as typhoid fever and scrofula, whose manifestations usually implicate the stomach or bowels, although they do not originate in that tract. Inflammation of the peritoneum, ascites, and abdominal tumors are also subjects which the reader might not expect to find, but which are included.

Besides the accurate general descriptions of disease, the author draws largely on his clinical memoranda for illustrative cases. Of these, nearly two hundred are given in detail, and the pathology of the diseases is abundantly explained from the extensive museum at Guy's hospital, and other sources.

With the thorough revision which it has received, Dr. Habershon's work will doubtless continue to be regarded as one of the best monographs on abdominal diseases in our language.

Demonstrations of Anatomy; Being a Guide to the knowledge of the human body by dissection. By George Viner Ellis, Emeritus, Professor of Anatomy in University College, London. From the eighth English edition. Illustrated. Philadelphia, Henry C. Lea, 1879. 8vo, pp. 716.

The plan of this work is to teach anatomy by directing the attention of the student first to the superficial prominences of bone and muscle, and to the hollows that point out the situation of the subjacent vessels; next to the cutaneous structure, and to the different layers of muscles, with their appertaining vessels and nerves; and lastly, to the joints and ligaments. Thus, in the dissection of the arm the author considers in order the front of the arm, the back of the arm, the front of the forearm, the palm of the hand, the back of the forearm, and the ligaments of the shoulder, elbow, wrist and hand. Instead of beginning with "the bones," in the traditional manner, he plunges at once, in the first chapter, into a dissection of the head and neck.

The plan impresses us as one very well suited to teach the relations of anatomy to surgery, and hence well adapted to students who have already a certain acquaintance with anatomy; but to the beginner in the science, and to him who would study it for itself, the method adopted by Gray and others is preferable. The present work is rather a dissecting manual than a treatise on anatomy, though no doubt it is excellent of its kind. We cannot speak in praise of the illustrations; many of them compare unfavorably with those in most other recent anatomical treatises. They are certainly much inferior to the cuts in Gray, and other anatomical manuals which have appeared in recent years.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	$5.00
Half-Yearly Compendium of Med. Science,	2.50
Reporter and Compendium, - - -	7.00
Physician's Daily Pocket Record, - -	1.50
Reporter and Pocket Record, - - -	6.25
Reporter, Comp. and Pocket Record, - -	8.25

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

D. G. BRINTON, M.D.,
115 South Seventh Street,
PHILADELPHIA, PA.

THE NEGLECT OF SANITARY PRECAUTIONS IN THE SOUTHERN CITIES.

On the threshold of a summer which promises to be more than usually filled with epidemics and rumors thereof, it is high time that the governing powers of States and cities carry out without delay those measures of sanitation which a long experience has proved to be of the greatest use in withstanding disease. It were worse than useless to spend this period in wrangling over theoretical points. Cleanliness, drainage, and disinfection, pure air and clean water, the destruction of adulterated foods, and the prevention of overcrowding, these are measures which Boards of Health should take in hand and carry through, regardless of the windy talk of theorists, and the obstructions thrown in their way by ignorance, false economy or obtuse conversatism.

So far as we have been able to learn, nothing of the kind has been done in the cities most afflicted last summer. Private letters and public statements concur in reporting New Orleans, Vicksburg, and Memphis in quite as deplorable sanitary condition as they were a year ago. The condition of the common cemetery in the first named city has recently been described as revolting beyond belief; the streets are dirty; and general negligence is obvious on all hands. The excuse there and elsewhere is "no funds." Having been prevented, by a decision of the Supreme Court, from cheating its creditors, the city finds itself compelled to meet the interest on its bonds. Hence, there is nothing left to protect the lives and business interests of the inhabitants! Change the name, and the story is the same of the other cities. Thus it is that fraud leads to destruction.

Can the medical profession of these cities and others similarly situated do nothing in this matter? Can they not unite in an appeal directly to the citizens, and by combining in a citizens' association, carry out sanitary regulations, in spite of the political complications? We see no other prospect of any successful effort being made.

Nor will any spasmodic attempt be sufficient. Sanitation does not mean a general sweeping up and clearing out once a year or once a month; but a steady, constant, unremitting application of the well known rules of cleanliness, temperance, purity in water, air, and food. A little is indeed better than none; but no efficient protection has ever been secured by desultory and irregular measures.

It is unfortunate that the innocent must suffer for the guilty; but such is the law of nature; and even the results of vice and neglect of duty have claims upon our sympathy; but certainly these cities have no right to expect any but a lukewarm response to their appeals, if they are again visited by the fever, unless now and henceforth they sedulously strive to protect themselves against it by observing the elementary teachings of sanitary doctrine.

MEDICINE AND MEDICAL MEN IN RUSSIA.

The condition of Russia, in a medical point of view, has been attracting the earnest attention of the rest of Europe since the close of the late war, and the outbreak of the plague and of malignant forms of typhus, and cholera, and

other epidemics in various districts. Thus, the Paris *Gazette Hebdomadaire*, of March 14th, observes that while the plague at Astrachan is exciting such widespread terror, diphtheria at the present time is causing still more terrible ravages, sweeping off nearly all the children of some of the villages of the rural districts; and the epidemic has prevailed in some of the districts in this manner since 1875, passing from village to village. In the district of Mirgorod, up to December, 1878, there had been 11,598 persons attacked, with 6224 deaths; or 12 per cent. of the population of the district, with 5½ per cent. deaths.

Apart from any authoritative announcement on the subject, it may be fairly assumed that the much-dreaded outbreak of the plague in Russian territory has come to an end. Recent intelligence confirms the assertion that the quarantine which had been strictly maintained around the suspected villages has been entirely removed, and that all excitement at St. Petersburg on the subject has come to an end.

In this connection, foreign journals inform us that the number of medical practitioners in the Russian empire in 1877 is stated to have been 13,098, of whom 2027 were doctors in medicine. In the course of the same year 500 students completed their studies.

The number of pharmacies existing in 1877 was 1621, or one pharmacy for every 49,350 inhabitants. In these pharmacies were dispensed during the year 9,319,655 prescriptions, the gross cost amounting to 7,033,361 roubles, or at the rate of 34 copecks per prescription. (A copeck is equivalent to about three-fourths of our cent.)

In Russia the ranks of the medical men are, to a great extent, filled by men of a low social standing, who, moreover, are usually servants of a despotic military power, and are by no means well educated. It is a peculiarity of that country that everything seems to be given a political bearing. When Prof. Botkin thought he had discovered a mild case of true plague in St. Petersburg, in February last, he was assailed in the bitterest terms, and almost accused of treason and nihilism. It seems that the nihilists would be delighted to have everything and everybody wiped out, and the Professor was supposed, in some mysterious way, to be furthering their designs by his diagnosis.

Notes and Comments.

Pathology of Tetanus.

In an essay on this subject in the *Transactions* of the Bristol Medico-Chirurgical Society, Dr. L. Fox states that he has found in autopsies of patients dying of tetanus (1) areas of cord softened, so as to be almost diffluent; (2) hemorrhage outside the spinal dura mater, and gummy-looking fluid beneath the arachnoid; (3) distention of the vessels and thickening of the membranes; (4) fissures in the posterior white columns; (5) softening of cord and many amyloid bodies in the gray matter; (6) creamy posterior columns, the softening seeming to be composed of colloid bodies. The colloid masses of which he speaks, and which do not take the carmine dye, are probably degenerated nuclei of the neuroglia. Dr. Fox believes that none of the lesions yet found can be considered as in any way causes of tetanus. It is more likely, he thinks, that the blood itself is in fault. In strychnine poisoning—a condition so analogous to tetanus—Dr. Harley has shown that the blood is incapable of absorbing oxygen in the usual proportion. The immediately fatal phenomena of many cases of tetanus seem to point to some such explanation. This abnormal blood imperfectly nourishes the cord, and either thus, or by its distinctly toxic effects, diminishes the resistive power of that organ—in other words, a cord so conditioned is abnormally impressible.

The Value of Nutritive Enemata.

A Parisian correspondent reports that a discussion took place at the Société de Thérapeutique, on the value of Nutrient Enemata. Basing his opinion on MM. Carville and Bochefontaine's experiments on dogs, which show that when food is introduced by the rectum only, in the form of bouillon, the animals survive no longer than when water alone is injected, M. Dujardin-Beaumetz maintains that feeding by the bowel is a delusion. If, as is no doubt the case, patients who receive nourishment by no other portal do live for a considerable time, this is no proof that the intestine absorbs what is intro-

duced. Hysterical subjects, and those suffering from cancer of the cardia, vomit all they swallow, and yet continue to exist notwithstanding. These views have met with much opposition; it was objected that what might be true of the dog did not necessarily follow in man; and most of the speakers who took part in the debate quoted cases tending to prove the efficiency of this way of feeding.

A Sign of Approaching Death.

An Italian physician, Dr. Chiappelli, states that he has frequently noticed in patients who were apparently very far from death an extraordinary opening of the eyelids, so as to give the eyes the appearance of protruding from the orbits, which was invariably a sign that death would occur within twenty-four hours. In some cases only one eye is wide open, while the other remains normal; here death will not follow quite so rapidly, but in about a week or so. It is easy to observe this phenomenon when the eyes are wide open; but when, as is generally the case, the eyes are half shut, and only opened from time to time, it will be found advisable to fix the patient's attention on some point or light, so as to make him open his eyes, when the phenomenon will be seen. The author is utterly at a loss to explain this symptom, and ascribes it to some diseased state of the sympathetic nerve.

Sunstroke Weather.

Dr. Fyffe, in the *Transactions* of the Bristol Medico-Chirurgical Society (vol. 1) has some observations on Sunstroke, which are valuable and practical. In his experience he has found that it was not upon bright days that cases of sunstroke generally occurred, but rather during cloudy, moist weather, with little movement of the air, even though the temperature was not so high—a circumstance which he believes explains the greater frequency of insolation on the continent of America than in the West Indian Islands.

Equine Virus for Vaccination.

Professor Chauveau, a distinguished European veterinarian, states, in the *Revue für Thierheilkunde*, No. 11, 1878, that he has obtained a pure and excellent lymph for inoculation by cultivating the virus on horses. He employs either sex and at any age, planting the virus on the nose, lips, belly or feet. He believes that the horse is better adapted for the propagation of the lymph than the heifer.

Vegetable Pepsin.

We have, on a previous occasion, called attention to the remarkable power of the juice of the *Carica papaya* as a digestive of animal tissue. In a recent number of the *British Medical Journal* we note a letter on the subject, from Dr. R. Neale. He says:—

"When in Batavia, I had constant opportunities of testing the value of the leaves, wrapped round chops and steaks during the cooking process, and can add my testimony to the exquisite tenderness thus imparted to the meat. For several years I have endeavored to induce my friends abroad to obtain me some of the dried juice, but the Batavian climate does not conduce to scientific research, and as the preparation of the dried juice is attended with some amount of trouble, I find it impossible to obtain a supply. The fruit itself is very wholesome, and is freely eaten as a dessert fruit; the Malays themselves swallowing the seeds also, when they wish to produce a purgative action.

Cutaneous Eruptions caused by Chloral.

In *La France Médical*, Dr. Mayer records five cases in which the administration of chloral in affections of various nature was followed by definite symptoms in uniform order. These came on after eating, beginning with redness of the face, excited action of the heart, and dyspnœa. The redness spreads to the neck; the palms, and sometimes the soles, being also affected. The eruption then appears on other parts of the body, and especially on the dorsal surface of the hands and wrists, the superior and anterior part of the thorax, the extensor surfaces of the knees and elbows, and the dorsum of the foot. It lasts from half an hour to a few hours, with itchiness of the part affected, and is followed the next day by slight desquamation. The spots are of a deep rose color, are sometimes slightly elevated, and have sometimes a sinuous border.

Is Intermittent Fever Hereditary?

This query is answered in the affirmative by Dr. Archambault, in the *Journal de Médecine*. He quotes a case where an infant of three months had enlarged spleen and other symptoms of the malarial cachexia. Its mother was healthy, but the father's constitution was saturated with malarial poison. This interesting question ought to be satisfactorily settled by physicians in this country, many of whom have extensive opportunities of studying miasmatic disease.

A Theory and Therapeusis for Chorea.

Dr. Hayden, in the Dublin *Journal of Medical Science*, suggests the theory that the choreic attack commences with vasomotor paresis, resulting from a profound emotional impression, and that the essential symptoms are due to defective polarity, or dynamic instability of the motor nerve tracts, both intracranial and spinal. On this hypothesis, the vascular congestion, central and peripheral, of the brain and cord, with occasional extravasation, and, in inveterate cases, cerebral sclerosis, noted by Dickinson, might be explained. The treatment of this disease with phosphorus and strychnia is strongly recommended, and a case quoted which, after resisting all treatment, and presenting the gravest symptoms, got well in fourteen days, under the use of five minims of "ethereal tincture of phosphorus," and three minims of liq. strych. every three hours.

The Cool Air and Water Treatment of Measles.

The *Allgemeine Med. Central Zeitung*, No. 29, 1879, contains an abstract of a long article by Dr. Kaczorowski, of Posen, on the discovery (!) made by him that cool air and sponging with cool water have no such disastrous effect in measles as old writers taught, but, on the contrary, relieve the distress of the disease and hasten recovery. This may be news in Poland, but we hope it is not in this country. Various able writers, among whom we signalize, for his earnest statements, Dr. Hiram Corson, have for years advocated it in this journal and in the *Transactions* of the Medical Society of this State. The old treatment of close rooms and warm drinks ought forever to be banished. They cause a more intractable form of disease, retard convalescence, and render the sequelæ more serious.

A New Method of Reducing a Retroflected Uterus.

Professor Schultze employs the following manipulation in the reduction of obstinate cases of retroflexion. The index and middle fingers of one hand are passed into the vagina; the middle finger is then passed into the retroflected uterus as far as the fundus; it is then bent back so as to reduce the flexion. The other hand, placed over the abdomen, takes note of any unevenness or adhesions on the peritoneal surface of the uterus. The uterine orifice is dilated with laminaria tents before the above manipulation is practiced.

CORRESPONDENCE.

FOREIGN.

Sea Sickness.

ED. MED. AND SURG. REPORTER:—

Our first day out, on April 1st, was a bright one, and the ocean waves were diminutive, even unto ripples, but in the night a heavy swell set in, with the effect of making almost all the passengers sick, but two appearing at breakfast.

After an experience of ten days, during which time only here and there I enjoyed a "lucid interval" from the woes of *mal de mer*, I can truly say no wretchedness is equal to that of sea sickness. There are many theories as to the cause of sea sickness. Wollaston suggested, sixty years ago, that the malady is due to the pressure of blood upon the brain. And it is well known that injury on pressure of the brain is almost invariably attended by vomiting, which is its earliest symptom. The sufferer from sea-sickness feels worst when the ship is descending. This is because the blood tends, by its inertia, to stay up when the brain is carried down, and the consequence is, crowding of blood into the vessels of the brain, and so pressing with increased force, producing a certain shock; this shock and the attendant pressure produce sickness and vomiting. In the case of sickness brought on by swinging, the nausea is most marked when descending forward, since the blood has then the greatest tendency to move from the feet toward the head. Upon this theory Sir James Alderson suggested the following treatment: "The first point is wholly to avoid the upright posture. Every one knows that it is a common practice to lie down, and this is done almost instinctively, but it is also known that to do so, though frequently successful, is not invariably so. The way in which the motion in a swing affects the brain affords the proper explanation why lying down is not invariably successful; and shows that it is necessary not only to take a recumbent position, but to lie in the right direction. A person lying down with the feet toward the bow of a ship is, while it descends in pitching, in the same position as a person in a swing descending forward, in which case we have seen that sickness is produced by blood being forced upon the brain. On the contrary, a person lying down with his head toward the bow is, during the descent of a ship, in the position of one descending backward in a swing, in which case the pressure by the blood will be toward the feet, and, therefore, relief rather than inconvenience will be experienced. It is highly desirable that this position should be assumed before the ship begins to move. There is a secondary advantage to be gained by closing the eyes, and so shutting out the confusion arising from the movement of surrounding objects."

My personal experience favors this plan. I would recommend its trial, provided that one does not sink into a chair at the very start with the full expectation—almost a determination—to be sick.

Treatment.—Dr. Rogers, our ship surgeon, says: "Sea sickness don't count," meaning by this that no drug treatment is used by him. He thinks the advice given by Prof. Parker, of New York, and Sir James Alderson, of England, good enough in certain stages and under certain restrictions; but he knows these plans are so easily overdone. He and the captain have actually carried patients from their rooms to the deck, to get fresh air and exercise. "Why," says he, "they would lie in their berths and rot." No air, no sunshine, no exercise, the blood leaves the surface, seeking the internal organs, the skin becoming cold, waxy, clammy, the muscles like wet rags. One must, as far as possible, resist, and try, by all means, to get on deck—crawl there, if necessary, but get where the air will refresh and alleviate the suffering. If feeling very badly, the reclining position may be sought after getting on deck. This is just where he thinks Prof. Parker's advice does harm—his followers go to bed, or recline in the state room. Whenever it is at all possible, Dr. Rogers advises the sick person to walk the deck, even if support is required to accomplish it. Thus, the blood is equably circulated, and the bad feelings are often driven off. I followed his advice myself, and feel certain that I should have been much worse if I had not kept on deck, and if I had not walked about, fighting my very best against the wretchedness. One of my worst days—a "black Friday," long to be remembered, it took me one and a half hours to dress myself, being compelled to lie down every few moments, while attempting to arrange my toilet. Finally, leaving undone about one half, leaving my gaiters unbuttoned, and hair uncombed, etc., I crawled on deck, then getting down in an easy quarter deck chair, head bow forward, letting the cool, moist wind fan my cheeks, and feverish head, I felt much better, and by evening could again walk the quarter deck.

It is my firm conviction that one can be preached into sea sickness; there is undoubtedly a nervous element in these cases. A child or a baby may sicken, it is true, but it occurs less frequently, and is sooner over. This is the common experience of the ship surgeons. Dr. Rogers says they are not "preached up" to the idea of being sick. Two children seated opposite to me at table were a continual mystery to us all. The richest foods, mixed with pies, cakes and nuts, eating between meals as well, were continually indulged in by them, and the boy complained only for a few hours of a little frontal headache.

Just a word in regard to eating on shipboard. The bill of fare on our first-class steamers compares favorably with that of first-class hotels, the food and cooking for the most part, being excellent. The sea air gives keenness to the appetite, and the danger is that one may be tempted to eat a little (or much) of everything on the list, making a good mixing up. The true way to do is, eat as much as you do at home. Don't let the "table d' hôte" lead you to indulgence. Eat faithfully, but do not mix too much.

C. C. V.

Dublin, Ireland, April 15th, 1879.

DOMESTIC.

The Pleuro-Pneumonia of Cattle.

Ed. Med. and Surg. Reporter:—

The disease called by veterinary surgeons "pleuro-pneumonia" has recently given rise to so much discussion, that a description of its true character will be opportune.

Bovine pleuro-pneumonia is *not* ordinary inflammation of the lungs; it is a *malignant fever*, introduced by contagion into the system of a healthy animal. This disease is different from all other known diseases of man or beast. It is of a subacute or chronic character. It consists essentially in a pulmonary interstitial exudation of lymph, one or both lungs being involved. This disease does not extend to other species; it *spreads only through contagion.* It is a *specific disease*, *peculiar* to cattle, slow and insidious.

The first, or incubative stage, lasts several weeks. In every country in which it has appeared it has caused great destruction, perhaps, greater, on the whole, than "rinderpest." As a rule, the disease is more rapid in its course as the animals are young, vigorous and in good condition. Those which are old, weak or sickly linger longer.

The duration of the malady varies according to the promptness with which the febrile symptoms supervene. Should these be late in appearing it may continue for several months.

This disease is *distinguished* from *ordinary* pneumonia by the insidiousness of its course; its incubative stage; its being *un*influenced to any notable extent by food, climate, exposure, bad hygiene, or modification of these; its not being affected by medical treatment; its great fatality; its *obvious contagiousness* and dissemination by movement of cattle, and its slow progress toward a fatal termination or imperfect recovery. The infecting principle of this disease is fixed and volatile, and exists in its greatest intensity in the air expired by a sick animal, and also in the lymph exudat. It is likewise present in the cutaneous emanations, and probably in the secretions and excretions, as well as in the blood. It is produced during the whole course of the malady, but is most abundant and virulent during the febrile stage. For a certain period after convalescence animals may transmit the affection. The contagium is also present for some time after death. The tenacity of the contagium does not appear to be well ascertained, but from the evidence at hand, it is very probable that it may retain its activity for several months—three to six months, if we are to credit good observers. Healthy cattle have been contaminated after being lodged in stables which were occupied by diseased ones three or four months previously. Hay soiled by sick animals has induced this disease after a longer period, and pasture grazed upon three months before has infected healthy stock. The flesh of diseased animals has also conveyed the malady.

We have no proof that any *other than bovine* animals will receive the infection of pleuro-pneumonia; breed does not afford any immunity,

neither does age nor sex, though, as in other contagious diseases all are not susceptible at a given time; often 20 per cent. escape. The incubatory period of this disease is variable; in the larger number of instances there is an interval of from three to six weeks, or two months, from the reception of the contagium to the primary manifestations of the affection. The *extension* of this lung plague is due to its *contagious properties.* Whenever it appears, it spreads in proportion to the opportunities for transmission, and its comparatively long period of incubation and duration renders its conveyance to immense distancees perfectly possible. In *winter*, when the cattle are confined to the stables, and but little communication with other herds takes place, this malady diminishes in severity, but in fine weather, when grazing commences, and different herds meet, if there is a diseased animal among them, it soon spreads; this *fact* is noticed every summer in Alexandria, Virginia, where the cattle are turned out on the commons together. A suspension of cattle traffic and movement in an infected country quickly reduces the number of attacks. *Calves* are often affected, and become carriers of the contagion. *I have seen* this fact several times proved in my practice, in England: about eighteen years ago, in Berkshire, I remember a large dairy of fine cows swept away by this disease, through buying one sick calf, and employing an ignorant "cow doctor," who did not believe in contagion or infection. *If this is true*, contagious pleuro-pneumonia is one of the most disastrous plagues that can afflict a cattle producing country.

The truth of this may be easily verified in the history and literature of the malady, particularly in England and Holland. When this disease appears in a herd, the most active measures should be adopted for its prompt extinction. Any person concealing the existence of the malady, and disposing of the infected animals, should be severely punished, and even compelled to make good the damage his dishonesty may cause; the diseased should be removed from the healthy, and the suspected also from the latter, the three classes being kept separate, and placed in quarantine. Scarcely any pains are too great to suppress such a plague, and when it appears on a farm, or in a locality, great sacrifices must be made to extinguish it on the spot, and prevent its spread; of course, the owners of the stock must be compensated for this great loss, for the public good.

Inoculation should only be practiced where there is the most *urgent necessity* for it; then it must be properly performed. The number of unsuccessful inoculations is about ten per cent. The *medical treatment* of this contagious disease is, in the majority of cases, unsatisfactory and unprofitable. When only one lung is involved (left to nature even) many of these will recover, but they will infect other cattle for a long time afterward. They ought to be fattened and killed as soon as possible.

Now, as to this disease existing in the State of Pennsylvania at the present time, I have made examinations of affected animals, both before and after death, in the counties of Philadelphia and Dauphin, and I declare the *disease there prevailing to be the same* which occasioned such great losses in England; and also the *same* which prevailed to a considerable extent in the vicinity of Brooklyn, N. Y., and Alexandria, Va., in all of which localities I have *personally examined* it, and made post-mortems.

Prof. Gamgee, in his excellent report, made nearly ten years ago, to the Department of Agriculture, at Washington, says that the first notice of the lung plague in the United States dates back to 1843, and is traced to a cow imported from Germany, and taken from shipboard into a Brooklyn cattle shed; from it the disease was communicated, and it is said and believed to have prevailed more or less in Kings Co., L. I., ever since.

In 1847, Mr. Thos. Richardson, N. J., imported some English stock; the disease was soon discovered among them, and he had slaughtered his whole stock, valued at $10,000, to prevent an extension of the plague. In 1850 a fresh supply of the lung plague poison reached Brooklyn, from England, in the system of an imported cow. In 1859 this disease was introduced into Massachusetts from Holland, by four cows, shipped at Rotterdam; one was killed, two died, and the fourth continued in a thriving condition. Several other animals were taken sick in rapid succession, and then it was that the idea was first advanced that the disease was identical with that known in Europe as *epizootic pleuro-pneumonia.* The disease was gaining ground rapidly, and the people of Massachusetts established a commission, for the purpose of exterminating it, as their report will show they succeeded. Prof. Gamgee also says this disease travels wherever sick animals are introduced, and that the great cattle rearing States of the West have been protected by the fact that they sell rather than buy or import "horned stock."

Prof. Law, of Cornell University, describes this disease as a specific contagious fever of cattle, with extensive exudations into the chest or lungs.

Mr. George Fleming, F.R.G.S., describes this pleuro-pneumonia of cattle as a specific and contagious disease peculiar to bovine animals.

Prof. Williams' definition does not vary; he says it is a contagious febrile disease peculiar to horned cattle, having an incubative period of from two to three weeks to as many months.

Prof. Liautard, of New York, says contagious pleuro-pueumonia has at last forced itself upon the attention of the American public. This dread danger has for years been lurking in our midst, gaining strength day by day, as it quickly spread from numerous foci of propagation, waiting only for the opportunity, which would some time come, to spread like wildfire throughout our land.

Dr. Tellor, of Philadelphia, says "pleuro-pneumonia in cattle is a contagious fever of cattle, accompanied by great prostration, together with local inflammation, and other diseased changes in the lungs and their envelopes. Cause—this, no doubt, is a specific blood poison."

I could go on, Mr. Editor, for a long time, giving you the views of many more men equally as learned, that this disease is *contagious* and *infectious*, and has no characteristics similar to

those that mark the disease known as pleuro-pneumonia in man.

JOHN W. GADSDEN, M.R.C.V.S.
Philadelphia. *Veterinary Surgeon.*

On Veratrum Viride.

ED. MED. AND SURG. REPORTER:—

It has been remarked that probably veratrum viride had never been given to a patient who would not have been as well off without it. I think that is correct. But whether correct or not, it is certainly very injudiciously used sometimes.

A few years since, in a case of great prostration and exhaustion from pneumonia, a counseling physician prescribed and administered a mixture of veratrum viride, gelsemium and aconite. He seemed to think it a very wise prescription, and to expect some miraculous effects from it, and was very much disappointed when, as a natural consequence, the patient sank with increased rapidity and soon all was over. I might cite other instances of the same character, but hoping that others will agitate this subject more, I will not do so now.

Mendon, Ill. W. SIGSBEE, M.D.

Tapeworm.

ED. MED. AND SURG. REPORTER:—

In your issue of March 22d, 1879, I notice a request for a "recipe for tapeworm," and as the following prescription proved most efficacious in the treatment of a patient who suffered for more than three years with tapeworm, I enclose it for the benefit of "D., of Pa."—

℞.	Bark of pomegranate root,	℥ ss
	Pumpkin seed,	℥ ss
	Ethereal extract male fern,	℥ j
	Powdered ergot,	℥ ss
	" gum arabic,	℥ ij
	Croton oil,	gtt. ij.

The pomegranate root and pumpkin seed must be thoroughly bruised, and with the ergot boiled in eight ounces of water for fifteen minutes, then strained through a coarse cloth. The croton oil must be rubbed up with the gum arabic and ext. male fern, and then formed into an emulsion with the decoction. This is a prescription of A. J. Schafish, of Washington; he employs no preliminary provisions beyond forbidding the patient to take any breakfast the day on which it is intended to remove the worm, and giving a large dose of Rochelle salts the preceding night. No unpleasant effects follow this remedy.

Duncansley, Miss. R. J. TURNBULL, M.D.

Remedies for Hiccup.

ED. MED. AND SURG. REPORTER:—

In the REPORTER of March 15th, page 238, I notice the long-known simple remedies for hiccup, such as sugar saturated with vinegar, and looking fixedly on the blade of an open penknife.

There is also an old remedy, known for years in this part of the country, viz.: Swallow nine mouthfuls of cold water without taking breath. These remedies prove effectual in the ordinary hiccup; but there are cases requiring severer treatment. Permit me to mention one that resisted these mild methods.

H. B., after a debauch, took catarrhal fever, and on the approach of the second cold stage had hiccup, which resisted all the ordinary means, the paroxysm lasting twenty hours before I was called to see him. Being close by, I took no medicine with me, save a vial of chloroform. Finding him in so low a condition, I saw that without relief he could live only a short time. I gave him 30 drops of chloroform in a little water, which acted like a charm; after a few minutes' respite the hiccup returned, and I repeated the dose, with a little increase, say 40 drops, which effectually relieved all symptoms. An active cathartic next day set him all right.

R. C. GIM, M.D.

NEWS AND MISCELLANY.

The Meetings at Atlanta.

We have received partial reports of the meetings, at Atlanta, of the American Medical Association, the Association of American Medical Colleges, etc., and in our next number will give full details.

The decision has been reached that a three years' course should be agreed upon by all colleges of the first class.

Medical Society of New Jersey.

The One Hundred and Thirteenth Annual Meeting of the Medical Society of New Jersey will be held in the Palisade House, Englewood Cliff, on Tuesday, the 27th inst., at 7.30 o'clock, and will continue in session the following day.

Steamers will be in readiness at Pier 34, on 24th Street, North River, New York, on Tuesday afternoon, to convey all physicians and their families who may wish to attend the meeting, free of charge.

Steamer "Idlewild" will leave at 3.30 o'clock, and "Chrystenah" at 4 o'clock, P.M.

WM. PIERSON, JR.,
Orange, May 1, 1879. *Secretary.*

Bulletin of Public Health.

The Bulletins for weeks ending April 19th and 26th report that in New York there was one death from smallpox, being the second from that cause during the present year.

The mortality at Philadelphia and Providence was materially increased, probably on account of the inclement weather prevailing.

Numerous cases of measles were reported at Pittsburgh.

In Baltimore there were 16 decedents of the average age of 79½ years; 38 per cent. of the deaths in that city were of children under 5 years of age.

The Savannah Board of Health report that "the city continues very healthy."

The Board of Health of Memphis report "pneumonia and malarial fevers prevalent."

The city physician of Vicksburg reports "health of city remarkably good"—11 deaths during past two weeks.

The bark Midas, from Rio de Janeiro, arrived at Boston April 18, and was placed under observation, and subjected to the usual sanitary measures at quarantine for a few days, most of the crew having been sick, and three having died at Rio de Janeiro and on the passage, from a disease reported by the captain to be yellow fever.

The commissioners appointed by the Governor of New York for securing the extermination of contagious pleuro-pneumonia, have prohibited the transportation of live cattle within the State, except by permission of the proper authorities; and the authorities of New Jersey having declared the eastern counties of that State to be infected with the disease, importations of cattle from thence into the State of New York have been prohibited, except for purposes of slaughter.

The Department of State has received information that the plague appears to have been extirpated within the district where it lately prevailed, and that the German Government have modified the quarantine regulations for Russian ships so far as to apply only to vessels coming from the Black Sea and the Sea of Azof.

The burning of sixty-seven of the infected houses condemned at Wetlyanka was completed during the past month.

The people of the district are resuming their usual pursuits of agriculture and fishing.

The U. S. Consul General at Constantinople reports, under date of April 4th, that the International Sanitary Council at Pera have decided to continue quarantine measures for the present. Sporadic cases of plague were reported at Kirzlan, a port on the Caspian Sea. The condition of Roumelli is reported as "very much improved." He invites attention to the danger from importation into the United States of carpets, rugs, and other woolen fabrics from Turkey. Many of them are old, and come from remote parts of Asia, Bokhara, Khoordistan, Afghanistan, and most frequently from Persia. "They are bought up by itinerant merchants, from individuals who have had them in use probably for years; * * * such an occasion as the death of one or all the members of the family causes the dispersion of their property, and among the rest their rugs and carpets. These articles are exported, not only by merchants, but also by travelers, who take them to the United States as luggage, and thus escape the sanitary examination to which they would be subjected as merchandise. * * * I have forbidden traders in carpets to bring their wares to my house, for I suspect that some of the mysterious cases of plague at points quite remote from the original places of infection may have been transmitted by some such agent."

Fluid Extracts of Wahoo Bark.

In reference to the statement made by Dr. J. R. Black in the REPORTER, page 335, col. 1, Messrs. Parke, Davis & Co. write us as follows:

"We would state that never since we have been in the business have we used one pound of the bark of the wahoo *tree*, for the preparation of the fluid extract or any other medicinal article. On the contrary, we use for this purpose a superior and selected article of the bark of the root.

"Furthermore, we use the full amount prescribed, of the root, and we thoroughly exhaust the drug of what the best authorities deem to be the medicinal principles thereof."

QUERIES AND REPLIES.

Dr. J. N. D., of Ill.—Dr. Binkerd's formula for burns is—

R.	Yellow wax,	ʒj
	Linseed oil,	f.ʒiij
	Tannic acid,	ʒj
	Subnitrate of bismuth,	ʒj

Heat the wax, add the oil and stir; when cold, add the tannin, and lastly the bismuth.

Dr. L. D. B., of N. J.—A variety of mechanical means for the support of prolapsus recti have been suggested. The pad and T bandage is sufficient in most cases. A well-fitting rectal supporter or truss can be obtained without difficulty.

Dr. L. M. T., of Ill.—*Wright* on Headaches, $1.25; *Day* on Headaches, $2.00.

Dr. W. V. M. T., of Pa.—Meigs & Pepper, "Diseases of Children," $6.00.

Dr. M. A. W., of Pa.—We have read your comment, and we still maintain that *scarlet rash*, *scarlet fever* and *scarlatina* are all synonyms of one disease. Scarlet rash is *scarlatina benigna*, or *sine angina*. Wood's *Practice* is too antiquated an authority.

MARRIAGES.

CHEESMAN—HANNOLD.—In Swedesboro, N. J., April 10th 1879, by Rev. A. M. Lake, John P. Cheesman, M.D., of Camden, N. J., and Miss Sue B. Hannold, of Swedesboro, N. J.

PRICE—BLUNT.—In Hinds county, Miss., April 9th, by Rev. Robert Price, D.D., Dr. Thomas M. Price, son of the officiating minister, and Fannie E., daughter of the late Beverly Blunt, Esq.

RUDGERS—PHELPS.—On April 9th, at Pavilion, N. Y., by Rev. A. Plumley, Mr. Denton W. Rudgers, M.D., and Miss Ella M. Phelps, both of Pavilion.

YOUNG—DOW.—In Wilkesbarre, Pa., April 16th, by Rev. F. B. Hodge, Dr. H. Newton Young, of Milford, N. J., and R. Ella Dow, of Wilkesbarre.

DEATHS.

ARMOR—In Brooklyn, N. Y., on Friday, April 25th, Mary M., wife of S. G. Armor, M.D.

BAKER.—In Youngstown, N. Y. on April 23d, Hattie A., wife of Dr. F. J. Baker, aged 35 years.

EVANS.—On the morning of Second-day, the 21st ult., at his late residence, No. 702 Race street, Philadelphia, Charles Evans, M.D., in the 77th year of his age.

HOOPES.—In this city, on the 25th ult., Pascal J. Hoopes, M.D., in the 52d year of his age.

JEWETT.—In Norwich Town, Conn., April 3d, of heart disease, Dr. Charles Jewett, aged 72 years.

KNOWER.—In New York, on April 13th, Mary Ludlow Gray, wife of Benj. Knower, and daughter of Dr. John F. Gray.

TAYLOR.—In Cincinnati, Ohio, on April 7th, 1879, Dr. D. E. Taylor, aged 44 years and 9 months.

QUINN.—In Cincinnati, Ohio, April 13th, Maria Louisa Slevin, wife of Dr. J. J. Quinn.

SYRUP-GLYCEROLE
OF
FERROUS CHLORIDE.

The Combination which all Forms of Iron must assume before Assimilation.

Superior to all other Iron Salts in that, while it is readily taken into the circulation, and does referruginate the blood, it does not ordinarily cause constipation nor headache. It is very pleasant to the taste, and is unalterable.

Ferrous Chloride is a neutral salt, consequently it has no action upon the teeth, and may be administered fearlessly. This fact and the delightful taste of my preparation render it an advantageous form for administration to children. Each fluid drachm contains one grain of Ferrous Chloride, which, owing to the certainty of its assimilation, is a full, active, adult dose.

McKELWAY, APOTHECARY,
Successor to O. S. HUBBELL.
1410 CHESTNUT ST., PHILADELPHIA.

WYETH'S
DIALYSED IRON.

(FERRUM DIALYSATUM.)

A Pure Neutral Solution of Peroxide of Iron in the Colloid Form. The Result of Endosmosis and Diffusion with Distilled Water.

PREPARED SOLELY BY

JOHN WYETH & BRO.,

PHILADELPHIA.

This article possesses great advantages over every other ferruginous preparation heretofore introduced, as it is a solution of iron in as nearly as possible the form in which it exists in the blood. It is a preparation of invariable strength and purity, obtained by a process of dialysation, the iron being separated from its combinations by endosmosis, according to the law of diffusion of liquids. It has no styptic taste, does not blacken the teeth, disturb the stomach, or constipate the bowels.

It affords, therefore, the *very best* mode of administering

IRON

in cases where the use of this remedy is indicated.

The advantages claimed for this form of Iron are due to the absence of free acid, which is dependent upon the perfect dialysation of the solution. The samples of German, French and American Liquor Ferri Oxidi Dialys. which we have examined give acid reaction to test paper. If the dialysation is continued sufficiently long, it should be tasteless and neutral.

Our dialysed Iron is not a saline compound, and is easily distinguished from Salts of Iron, by not giving rise to a blood-red color on the addition of an Alkaline Sulpho-Cyanide, or a blue precipitate with Ferro-Cyanide of Potassium. It does not become cloudy when boiled. When agitated with one part of Alcohol and two parts of Ether (fortior), the Ether layer is not made yellow.

Physicians and Apothecaries will appreciate how important is the fact that, as an antidote for Poisoning by Arsenic, Dialysed Iron is quite as efficient as the Hydrated Sesquioxide (hitherto the best remedy known in such cases), and has the great advantage of being always ready for immediate use. It will now doubtless be found in every drug store, to supply such an emergency.

Full directions accompany each bottle.

Physicians will find our DIALYSED IRON in all the leading drug stores in the United States and Canada.

It is put up in bottles retailing for **ONE DOLLAR**, containing sufficient for four months' treatment Large size is intended for hospitals and dispensing. Retail at $1.50. Price Lists, etc., sent on application.

NEURASTHENIA.

A paper read before the Albany (N. Y.) Academy of Medicine, March 4th, 1879,

BY DR. W. O. STILLMAN.

(*Concluded from p.* 400.)

Languor and General or Local Weakness.—We now come to an altogether different class of symptoms, embracing the motor apparatus, the sensory department of the nervous system, and glandular organs. The preceding conditions which we have considered were entirely connected with the cerebrum and the exercise of the higher faculties; the present ones with the grosser animal functions. A sense of general fatigue is very common. At times it disappears. It comes and goes, like a will o' the wisp. At one moment feeling as though possessed of the strength of an athlete, at the next as weak and impatient as a babe in arms. This sense of sudden and profound exhaustion will come on without any premonition, seizing a patient when in the midst of the performance of his or her duties. I have known patients who were able to take walks of considerable extent at one hour, with no sense of fatigue being apparent, and at another could make no exertion without great effort. Sometimes there is a peculiar leg weakness; this is associated with certain forms of myelasthenia, and especially with that growing out of sexual indulgence. As a rule, the general strength is impaired, even in pure cases of cerebrasthenia, and markedly and invariably so in myelasthenia. Aside from the general sense of weariness and lassitude, a muscular trembling is very frequently present, and sometimes muscular spasm, although the last but rarely in my experience, and then confined to twitching of the orbicularis palpebrarum muscle. The trembling becomes apparent upon any unaccustomed exertion, or upon strong, or even slight, mental impressions being made. These phenomena connected with the muscles naturally arise from the diminished nervous force, and vary with the individual, the stage of the affection, and the more or less impairment of the functions of the cord. Again, the nerves of

Sensation are affected, and we have impressions of heat and cold, or, indeed, actual heat and cold present. Flashes of heat are met with occasionally in nervous asthenia. Localized spots of cold occur, which resist all efforts at warming, and remain cold, whatever the surrounding temperature. *Creeping* and *crawling* sensations, on or just beneath the skin, occur also. I met with a case of this nature, in which nothing afforded relief so completely and promptly as electricity, applied by means of the interrupted current. It would recur whenever any special drain had been made upon the nervous system, but always yielded, for the time at least, to the electric current. Sometimes it is itching on the arm, side, or any other portion of the body. Again, *ticklishness* is abnormally present. *Hyperœsthesia* and *anœsthesia*, local or general, are occasionally found. The former, in connection with flying neuralgias, is not at all uncommon. Neuralgia flitting from part to part constitutes a portion of the stock in trade of the neurasthenic patient, and may be expected to be met with. It will be in the arm, in the head, in the neck, or the toe, and no sooner is the foe vanquished in

one direction than it peeps out and develops itself in another. Poverty of nerve force, causing pain, has been suggested as an explanation of the rationale of what are known as growing pains in children. Coldness of the extremities is very common, as is also cerebral and spinal pain. Nervous irritation is so frequently linked in with neurasthenia that localized points of tenderness along the spine and on the head are met with in a large percentage of cases, indeed, in an astonishingly large ratio. This condition is vastly more common in modern society than is currently supposed, even in the profession. Cold increases the inconvenience felt from this affection, and labor, mental or physical, adds to the discomfort. Sometimes the head pain involves the whole head, but more frequently it is unilateral, and seems to have a decided predilection for the supra-orbital region, preferably the right side, in my experience. Shaking the head, or jar, usually make it worse. Beard mentions soreness of the gums, but I have not met it.

Nutrition, in these cases, is frequently good, and their robust, hearty appearance excites smiles of incredulity on the countenances of friends when any ailment in connection with them is mentioned. I have known them to gain steadily in weight, even when in the very midst of the slough of despond, and at their worst. Quite as frequently, however, they are in but indifferent condition, and are troubled with a nervous dyspepsia, which, like Oliver Twist, constantly cries for more food, and yet, when that is secured, it only adds to their misery. The wants of their system demand supply, but the weak stomach is inadequate to its duty. Meals frequent, and small in quantity, best meet the requirements of the case. Flatulence and oxaluria are also met with. The latter I am familiar with in but one case in this connection. A case of the former was under my observation for some time, in which it existed to a very annoying degree; so much so as to necessitate the individual leaving the room to relieve himself. It finally disappeared under treatment.

Redness of the face, and irritable eye also occur. The redness is nearly always synchronous with the development of an attack of depression, and sometimes precedes it. The eyes will become injected and painful, and the redness frequently intense. There may be a tendency here to confound the relation of the hyperæmia to the nervous state. It would seem that hyperæmia and anæmia must cease to be regarded as a cause in disease. Many times when the diagnosis of hyperæmia or anæmia, especially local, has been made, the practitioner rests confident that he has reached the root of the matter. But I think the opinion is gaining ground that it is a result, not a cause—a symptom, not a disease; that it is secondary to preceding conditions which have their origin in the nervous system. This view is maintained by Erb and Vulpian, and many of the best neurologists of the day. When, therefore, this hyperæmia of the cutaneous vessels of the face and eye exists, predicating a similar condition in the capillaries of the brain, it would seem that it is a mistake to assume that afflux of blood is a cause of the depression, but that it is necessary rather to go further back and examine into preceding psychical and neurotic conditions.

Even when the face did not show the congestion, the conjunctiva, the more delicate indicator of vascular states in the head, would be strongly hyperæmic. This has led to the form of the affection known as irritable eye. I have met with some marked cases illustrating this feature. The eye would cause much pain and annoyance, and though local measures would control it, it would only disappear finally as the nervous condition improved. Photophobia and diplopia are also met with, the former not infrequently. Muscæ volitantes are common; as they are to any form of nervous debility or optic overwork.

Sounds in the ears frequently occur, especially of a roaring character; also abnormalities of taste and odor. There is now a case under observation at the Institute, who for several weeks complained of a most intolerable taste in her mouth, which disappeared under electrical treatment. The

Secretions are frequently at fault or affected, in this disease; such as those of the lachrymal and salivary glands; the sudoriferous follicles; the intestines and testes. Tears may be induced by the melancholy which seizes upon the patient, but many times they flow without their knowing why. Quite copious lachrymation occurred in two of the cases, male patients, referred to before. The salivary gland is more or less affected in the case of the lady recently mentioned, in connection with abnormalities of taste. The bowels are seldom affected, except in myelasthenia. I have one case of that nature now under observation. In concluding the history of symptoms, reference should be made to

Spermatorrhœa: an important feature in many cases of neurasthenia. Affections of the genitals may occur in the relation of cause or effect. Thus, impotence not infrequently results from nervous debility; and nervous debility occurs from too frequent emissions. The impotence may

be caused by suppression of the secretion of sperm, due to deficient nervous force modifying the activity of the glandular tissue of the testes, or to loss of desire. In either case it will usually disappear upon the recovery of health, without the employment of local or special measures. But more commonly it appears in the relation of a cause, and constitutes what the Germans call "an irritable weakness" of the organs of generation. There is great desire, with little ability for gratification. The emission is inclined to be premature, and often followed by great prostration. The general system is much weakened, and the myelasthenic type of the disease more likely to predominate over the cerebrasthenic. Weakness of the back, and a loss of muscular tone in the limbs and trunk are then found. This prevails to a large degree throughout society, and is altogether too common for the good of humanity. I believe it is the general opinion of observers that masturbation does not produce this disease nearly as frequently as sexual connection; that it is found most commonly in illegitimate commerce and the early months of marriage. Then, moderation and time will usually restore the lost health, and allow the evil effects to disappear. Unconscious nocturnal emissions are productive of a good deal of mischief in many cases. They will occur in excessive quantities, several times a week, rendering the patient weak and pale, and dejected. When genital affections appear as a cause, the recovery is likely to be obstinate, and it is not nearly so favorable as when they come secondarily.

In concluding a review of the symptoms, I feel compelled to remark upon the great rapidity with which they may interchange one for another. Unlike organic affections, they are not local or permanent in their nature, but come and go, like clouds in summer. A patient may ring the changes on three-fourths of the possible symptoms in twenty-four hours, and introduce several novel, gratuitious phenomena for which you are not prepared. No sooner is one series of troubles subjugated than a whole crop of others spring up. Like Pandora's box, the lid once off, there is no end of possible embarrassments.

The *course*, *duration* and *termination* or sequelæ, demand a brief attention, and may be quickly summarized. Its approach is usually insidious. There may be weeks and months of sleeplessness by night and worry by day, and fits of depression gradually increasing in severity, in duration and frequency. The other symptoms enumerated gradually make their appearance, and at last we have a fully developed case of neurasthenia before us. There may be periods of cessation of symptoms during its incipiency, or of temporary improvement after full development has been reached, but the individual does not realize the danger in whose presence he walks, or if he has been warned, neglects the signal or is pressed irresistibly on by force of circumstances. Too many cases give this history. Another method by which it makes its advent is by a sudden entree. Some great mental or physical shock prostrates the patient; it may be grief, it may be some other violent emotion, or it may be excessive exertion; and then there is a rapid development of all the symptoms. It takes a long time to recover from these bankrupt, nervous states; the capital is almost gone; only sufficient is left to make life miserable, many times, and not enough to start anew. It may be for years, and it may be while life endures. Some slowly recover after the lapse of a few months; others take years; but an incurable debility frequently hangs around them the remainder of their days. Under judicious treatment, however, they often greatly improve, and nearly all the symptoms may be ameliorated. Business men, as well as professional ones, after a few months' treatment, frequently resume their avocations, not what they were before, perhaps, for that is a work of time, but materially benefited. Relapses occur; this is a disease, unfortunately, which does not ensure security against a second attack. Among the sequelæ may be mentioned derangement, associated with hypochondria. The weakness of the system favors the development of diseases to which the person may be predisposed. Suicide occurs, and a tendency to desire stimulants is very common. This, together with the opium, chloral, cannabis indica and chloroform habit, needs to be very carefully guarded against. I have met with some distressing cases of this class.

Pathology.—The pathology of neurasthenia, if there be any, has received little or no attention. It is undoubtedly a functional derangement, and affections of that class are at present enveloped in a good deal of obscurity. Erb, who has written upon it, ventures to say but little, and seems to incline favorably to the suggestion of a condition of anæmia. My experience, which embraces quite a large number of cases, does not support this hypothesis, and as before remarked, I think it our duty to go further back, and not confound the symptom with the disease. A rational explanation appears to be that it is a debility affecting the nerve cells; that there is a deficiency in vigor in the gray matter of the brain and cord.

This cell debility arises, as is frequently the case elsewhere, from functional overwork, which weakens and enfeebles cell life, thereby interfering with the power of assimilation and nutrition, and, as a consequence, with capability of performing physiological duty. Hence, the condition and symptoms found in neurasthenia. Just as overdrain upon physical strength may shatter and permanently weaken the muscular system, so great draughts upon nervous energy may produce a similar result in the nervous system. Whether this functional affection may change to an organic disease does not here require discussion. There may be coincident conditions of hyperæmia and anæmia, but I think it has been found that they disappear upon treatment being directed to the nervous system, particularly nerve foods. Certainly local variations in circulation are subservient to nerve control, as has been repeatedly demonstrated by ample experiment. We have now reached a point at which diagnosis may be taken up.

Diagnosis becomes comparatively easy. It requires a consideration of the history of the case, in connection with the symptoms enumerated, and a differentiation from a few affections with which it may possibly be confounded. The condition which immediately excites attention is the vast disproportion between the subjective and objective signs. Thus, it may usually be distinguished from commencing tabes, active hyperæmia, incipient inflammations and irritation, and organic affections of the cerebro-spinal system generally, by the absence of the appropriate objective signs which are characteristic of these affections, and by the prolonged or chronic type of this malady. Also from the fact that the subjective symptoms of neurasthenia are more transient and fluctuating than those pertaining to organic diseases. It must also be distinguished from general anæmia and hysteria. It is not necessarily connected with anæmia, and very frequently is not; less mental depression is associated with anæmia; it also yields readily to iron, whereas neurasthenia does not. Anæmia is more common to females, and occurs in connection with a history of indoor confinement and bad nutrition. The other with great intellectual labor and worry, or emotional or sexual exhaustion. In hysteria, there is found the globus hystericus, ovarian tenderness, local or general anæsthesia, particularly of the epiglottis, and a non-balanced mind without the usual history, and more acute symptoms generally. Some of the after effects of sunstroke bear some resemblance to neurasthenic symptoms. In neurasthenia, a due regard must be paid to temperament and family history, and the fact that certain of the just mentioned maladies may be combined, and inextricably mixed up with it. As far as differential diagnosis itself is concerned, perhaps enough has been said. It remains to speak of the two divisions made of neurasthenia, into cerebrasthenia and myelasthenia. The division is important, especially as regards hygiene and treatment. Dr. G. M. Beard has given a very succint description of the symptoms peculiar to each (as reported in the *Medical Record*, No. 433), which I can do no better than to quote. He says, in regard to

Cerebrasthenia: "The symptoms of exhaustion of the brain are, tenderness of the scalp; a feeling of fullness in the ears and head; vertigo; tenderness of the gums; fluctuating disorders of the special senses, such as a morbid, subjective smell, noises in the ears, flashes of light before the eyes, muscæ volitantes; morbid desire for stimulants and narcotics; deficient thirst; gaping, yawning; congestion of the conjunctiva; tendency to shed tears; mental depression; impairment of memory and intellectual control.

"*Myelasthenia:* The symptoms which suggest myelasthenia or spinal exhaustion are, local spasms of muscles; local chills and flashes of heat; shooting pains in the limbs; startings and jerkings on falling to sleep; morbid sensations at the bottoms of the feet, as burning or tenderness, vague pains in the feet, podalgia; sexual debility in its various phases; pains in the back, any part of it, from the nape of the neck to the tip of the coccyx, with or without the accompaniment of spinal irritation; creeping and crawling sensations up and down the spine; incontinence of urine; paresis of the bladder; feeling of pressure in the chest, with or without ticklishness of that region; heaviness and stiffness of the muscles, simulating rheumatism; great sensitiveness to cold and changes in the weather; hyperæsthesia of mucous membranes, as of the throat, urethra, or larynx; morbid dryness of the skin, or morbid perspiration; dryness of the joints and dilated pupils. There are certain other symptoms, such as nervous dyspepsia; constipation, flatulence, sick headache, in all its phases, numbness, hyperæsthesia, insomnia, which manifest themselves both in connection with cerebrasthenia, or brain exhaustion, and myelasthenia or spinal exhaustion." It will be observed that he mentions several symptoms which I have not enumerated. I did not, for the reason that some of them I had not met with, and others were inconsequential, possessing no special significance. On the whole,

my observations confirm his as regards the manifestations peculiar to this disease. The

Prognosis, as has been intimated in the remarks on course, duration and termination, is not of the most favorable nature, commonly. It depends upon the degree of severity to which the disease is advanced, upon the wreck that has been made in the nervous system. At the best, it will take considerable time to get the system in a condition approximating the normal. The effects of the attack may linger for years, and perhaps, through life. It also depends largely upon the temperament of the individual, his environment, and the means adopted for his or her recovery. And this brings us to regard the treatment; the last and most important feature for us to consider.

Treatment may be divided under two general heads, both important ones: hygienic, including a very broad ground, and medicinal. Correct hygiene is very necessary, and includes diet, sleep, exercise, social life, environment, rest and bathing. The diet should be generous and varied, for it is desirable to cultivate the physical health, both that it may not be a burden to the impoverished nervous system, but rather a means of regulating the same and raising its lowered tone. It is especially desirable that the diet should embrace the phosphates, including fish, fats, etc., and that it should be easily digestible. The stomach and alimentary canal have shared in the universal debility, and regard must be paid to their idiosyncrasies and weakness. In order that appetite and physique may be encouraged, open air life and exercise are invaluable. Climate must be considered, and both mountain air and sea coast are superior, in many respects, to that ordinarily experienced. At this point, the distinction between cerebrasthenia and myelasthenia must be considered. In the former, physical exercise is usually of much benefit, and may be practiced without detriment, but in the latter it is often well nigh impossible and disastrous. In both, open, fresh air is desirable, and in severe forms of myelasthenia it may be best merely to sit in the outdoor air, and in that way get as much as possible. Or, perhaps, riding may be indulged in discriminatingly. Open air exercise should never be practiced to the point of positive fatigue or exhaustion. In moderation it strengthens the body and limbs, improves the appetite and helps digestion, promotes better blood, by assisting metamorphosis and elimination, and best of all, exercises a healthful influence upon the brain and intellect. In some cases absolute rest may be desirable, but in all, good sleep is imperative. Sound, natural sleep is the best medicine for the morbid, nervous system in the world. Early and regular hours for retiring should be observed, and a cool, airy, well-ventilated apartment for sleeping purposes secured. A change in scene and surroundings from time to time is salutary, and the social atmosphere should not be neglected. It is of the highest importance what the domestic and social life may be. Light, cheerful and joyful surroundings will pull a man out of the slough of despond in spite of himself. And it is noticeable that during these hard times the comedies are all the run, and amusement is at a premium. Nothing is so popular as a laugh. Amusements, to succeed, must avoid the tragic and seek the comic; the farce is most patronized of all. The lyceum calls for comic, and even the pulpit prospers most that wedges in the jest. * * * In Paris, during the reign of terror, the comedies drew great crowds. So much for the social environment. Relief from care and responsibility is necessary, and stimulation or gratification of the sexual appetite should be strictly avoided."

In connection with exercise and gymnastics come baths. The Germans recommend them in various forms, particularly the sea baths and sponging. It has been my experience that great good has resulted from the warm baths, particularly when combined with electricity. Erb, vide Ziemssen, recommends sitz baths, and I have seen valuable results, especially in insomnia, where sleep has been procured, which had resisted electricity and strong medication. It also assists in warming up the extremities, quieting the brain and tranquillizing the system. The salt baths are stimulating and protective against cold. Turkish and Russian baths are useful from their alterative action and stimulation of the functions of the skin, and I know of nothing which will break up a cold quicker, not even quinine, than a Russian bath. Some authorities condemn cold, but I must say that I have seen good results from the cold spray and douche, directed against the spine, in rousing up the dormant energies of the nervous system. Massage and shampooing is beneficial; both are good for the circulation, and to a certain extent take the place of mild exercise. Massage, combined with faradic electricity, I have seen work out excellent results in the constipation of myelasthenia. Counter-irritation, such as blisters and capsicum plasters, are also occasionally necessary. And in the spermatorrhœa forms of the disease, the cooling catheter or passage of

the sound are extremely valuable and almost indispensable.

Medication, strictly so called, is not so useful in my experience in this affection, as substances which more properly come under the head of foods. Thus some of the best results have come from the phosphates. The malt and cod-liver oil have done well. Malt, in combination with phosphates of iron, quinia and strychnia has seemed a valuable preparation. Of the phosphatic preparations, Prof. Horsford's Acid Phosphate has rather claimed the palm, although Crosby's Vitalized Phosphate, and a pill of phosphorus and nux vomica, manufactured by Schieffelin, have been very useful. Phosphoric acid, dilute, has also been used. Under the head of medicines strictly, the bromides have, with me, been the most prominent. A combination of the bromide of potash with Fowler's solution and tincture of nux vomica has been very useful. As a sedative direct, the bromides appear to be without an equal in this affection, and I have seen excellent results from the use of the bromides of potash, soda, ammonium, lithium and camphor. The latter especially in the headaches associated with a low state of the nervous system. Next to the bromides, strychnia seems to hold the leading position in the estimate of the profession. In the form of nux vomica I have seen it used much, but always in combination. The Germans speak very highly of iron and quinine, and little of anything else. The indications seem to point to sedative as well as tonic measures. In tonic treatment, quinia has rather taken the precedence. Gross' pill, without the morphia, has met other indications and proved useful; also well known preparations of bark. To meet certain manifestations, preparations of caffeine, cocoa and guarana have been used. Beard speaks of calabar bean and zinc, but I have had no experience with them, except with the latter, with little result. Alcohol is comparatively little used. As a hypnotic in the insomnia of neurasthenia, opium has little value, and I have seen the best effects from a combination of the bromides and chloral. The various symptoms must be met as they appear, and receive their appropriate treatment.

In conclusion, I will speak of *Electricity*. I have seen much of its use, both of the galvanic and faradic currents. The galvanic I have usually applied, in either the central or general methods, such as are recognized by specialists and electricians, or locally for the relief of neuralgias, the trembling, and crawling, and itching, and other symptoms found in neurasthenia. It has yielded excellent results, both as a tonic and sedative, and has relieved some severe cases of insomnia. The faradic current, in connection with the thermal bath, is one of the best tonic and stimulant means with which I have met. Its effects have been marvelous in certain cases, and it seldom fails to yield satisfactory results. Occasionally there have been cases which possessed an idiosyncrasy contraindicating the use of electricity, but they are few and far between, and when met with other measures have to be resorted to.

Hospital Reports.

COLLEGE OF PHYSICIANS AND SURGEONS, NEW YORK.

CLINIC OF PROF. T. GAILLARD THOMAS, M.D.

REPORTED BY P. BRYNBERG PORTER, M.D.

Case 1.—Adeno-Sarcoma of the Ovary Removed by Laparatomy.

GENTLEMEN:—You all doubtless remember the case of the patient with an abdominal tumor, who came before us two weeks ago to-day, accompanied by her two physicians, and who was afterward to be sent to the Woman's Hospital for operation. She had been ill, as you will recall, for three weeks, and during the last year had been failing rapidly; so that she appeared so weak that it seemed probable that she could not last much longer unless something was done for her relief. Consequently, I advised an operation, and on Saturday last (six days ago), I performed it at the hospital.

The patient having been anæsthetized and lying upon her back, a very long incision was made through the abdominal walls, extending almost from the umbilicus to the symphysis pubis. As soon as the peritoneal cavity was reached, I perceived that it contained a large quantity of clear, straw-colored fluid; and this having been removed, I found the tumor, which was so large that, notwithstanding the length of the abdominal incision, I was obliged to increase the size of the latter still further with the scissors, in order that it might be extracted. It was a solid mass, and on attempting to lift it up, I ascertained that three loops of intestine were, unfortunately, attached to it. I did not dare to attempt to pull off the intestine by tearing the adhesions binding it, for fear of meeting with an accident which has not infrequently happened under similar circumstances while ovariotomy was being performed, and which almost necessarily gives rise to fatal peritonitis, viz.: causing an opening into the intestine. When this does occur, the only chance at all of saving the patient's life is to make an artificial anus, if the orifice is sufficiently large, and fasten the intestines to the edges of the latter; but such an anus is sure to render the patient miserable ever afterward, and in my opinion it is a little worse than death itself.

I therefore adopted a procedure in regard to the loops of intestine which I am in the habit of resorting to under similar circumstances, when performing the ordinary operation of ovariotomy. As the adhesions between the intestine and the tumor were very firm, instead of attempting to separate them, I simply cut off a small portion of the tumor with the knife, and allowed it to remain connected with the intestine, and then fastened this piece of the tumor between the lips of the external wound. By thus allowing the piece to remain, I avoided the risk of peritonitis, which, as I said, would have been almost certain to follow the attempt to pull off the intestine from the tumor; and by securing it between the lips of the wound I avoided the risk of septicæmia from putrefaction, which would undoubtedly have resulted had it been allowed to remain in the abdominal cavity. By this means, whatever effusive discharge might occur, would be poured, not into the latter, but outside of the body, and would consequently be innocuous. As the tumor was possessed of a pedicle, this was secured by means of a clamp, and the abdominal wound was then closed with sutures.

Before going on with the history of the patient after the operation, I will first speak to you of the tumor itself, which I now present to you for inspection. When first removed, nearly a week ago, it was fully of the size of an adult head; although, owing to the action of the strong alcohol in which it has been preserved, it is now perhaps one-third smaller than it was then. It was also quite vascular, and the drainage from it has likewise tended to reduce its dimensions. On the lower surface of the mass I discovered a cyst of some little size, which was, of course, unappreciable before the removal of the tumor, on account of its position. With this exception, the tumor was perfectly solid.

When the patient was before you at the clinic, a fortnight ago, I told you that I was of the opinion that it was a uterine fibroid, with a long pedicle, and gave you my reasons for supposing it to be of this nature. In the first place, as I said, ovarian fibroids, and, indeed, solid tumors of the ovary of all kinds, are exceedingly rare; and as this was evidently a solid tumor, the great probability was that it was connected with the uterus. It was, however, one of those very rare exceptions to the general rule; so that when I got my hands into the abdominal cavity, I discovered that the tumor was in reality the left ovary. I had, of course, made an error of diagnosis; but if twenty similar cases were presented to me I should certainly make the same diagnosis again; simply because a tumor of the ovary such as this is so exceptionally rare. I have now performed ovariotomy considerably over one hundred times, and yet this is the very first case that I have ever met with in my operations, and only the second case that I have ever seen at all. The other case was one in which I made the diagnosis of solid tumor of the ovary, and when it was afterward removed by Dr. Atlee the diagnosis was confirmed. Dr. Peaslee, in his work, as I before mentioned, was able to cite only two instances as having occurred in this city; one a case of Dr. Van Buren's, and the other a case of mine. In the latter, however, there was good reason to suppose afterward that the tumor was really uterine, and not ovarian at all.

This, then, you will understand, is an extremely rare case. The tumor is not a pure fibroid in its nature, but is of the character of what is known as adeno-sarcoma. It has been at least three years in growth, and is a striking instance of that interesting condition, which is, as I say, so exceedingly uncommon.

Now, with regard to the patient. For the first forty-eight hours she did perfectly well, and this, I must confess, was somewhat of a surprise to me; for, on account of the intestinal complication and the patient's very weak condition, I apprehended the most serious results. At the end of the forty-eight hours, however, it was noticed that the temperature was as high as 100 to 100½, and that the pulse ranged from 100 to 110. From that time the temperature went steadily up. By the first hour later it had reached 101½ degrees; by the second, 102; by the third, 102½; by the fourth, 103; and by the fifth hour, 103½. Although any one who has had much experience in ovariotomy and other similar operations can never feel very sure about anything in regard to the subsequent condition of the patient, I was then quite certain that this woman was going to die. She was seen by a number of experienced surgeons connected with the Woman's Hospital, and we all believed that she was about to have peritonitis, that during the night the temperature would run up to 106, and the pulse to 160, and that the next morning she would be dead.

For some time past it has been my practice to have all patients upon whom I perform ovariotomy placed on Kibbee's fever cot immediately after the operation, so that we may be at once prepared in case alarming symptoms begin to develop. So in this instance no time was lost in making cold affusions. The body having been stripped from the axillæ to the hips, some mosquito netting was wrapped around the trunk, and a rubber cloth placed over the chest, in order to avoid any pulmonary complication. In this case this precaution was especially important, because one of the patient's lungs was completely consolidated. Water at the temperature of 75° was then poured steadily, for ten minutes, upon the mosquito netting enveloping the body, and when at the end of that time a thermometer was placed in the water (which, by means of the rubber trough beneath the cot, had been emptied into the tub at its foot), its temperature was found to be 83°. The additional heat had all been derived from the patient's body.

Word was left that the affusions should be repeated every hour during the night, and next morning it was gratifying to note that the temperature had gone down to 99½, and that the pulse was only 110.

What other measures could have accomplished such a result as this? In my opinion, nothing else whatever that is known to science. I am quite aware that some of those present are ready to tell me that large doses of quinine, salicylic acid, or other so-called apyretic, would have done the same. But I must respectfully beg leave to differ; for I have tried all such agents over and over again, and found them to utterly

fail me. They have been weighed in the balance and found wanting. I do not forget the old saying, that "one swallow does not make a summer;" but this is not an isolated case, but one out of many. I have repeatedly resorted to this procedure in cases of ovariotomy, and always with the happiest results, so far as the reduction of temperature was concerned. It is only three weeks since a patient of mine, suffering from an ovarian cyst, with intestinal complications, was threatened with symptoms of the most violent peritonitis after the operation for its removal; and yet they were all promptly dissipated by an early resort to this plan of treatment. But, it may be asked, how do I know that the reduction of temperature and pulse is the result of the cold affusions? I judge only by experience; and I have seen such a result immediately follow the application of cold in far too large a number of cases to attribute it merely to a coincidence. Therefore, I lay great stress upon this method of treatment; believing it, as I do, to be by far the best that has yet been devised for the reduction of high temperature following ovariotomy and other similar operations.

After this the patient did very well again, up to the day before yesterday (Wednesday), when she was suddenly seized with the most violent retching and vomiting, and was unable to retain anything whatever upon the stomach. This prostrated her very much, and her pulse, which ran up to 150, was exceedingly small and feeble. There was, however, no increase in the temperature. In consequence of the patient's great exhaustion, the attempt was made to nourish her by the rectum, although the difficulty of introducing food by this method is so great in such cases as to constitute a very serious objection to it. In addition, therefore, I directed the house surgeon to inject half an ounce of brandy into the cellular tissue of the arms, by means of the hypodermic syringe, every two hours. This was kept up all through the night, and by yesterday morning it was noted that the pulse had become greatly reduced, and the heart's action was much stronger, while the temperature still remained low. To-day it gives me great pleasure to report the favorable condition of the patient, as stated in a note which I have just received from the house surgeon. In it he says that she is doing well. The pulse is 106, the temperature 99; she is able to take a fair amount of nourishment, and is comparatively free from pain. From this account I am encouraged to believe that our patient is now entirely out of danger, because she has successfully passed through the period when peritonitis is likely to occur, and there is no risk of septicæmia, for the reason that, this being a solid tumor, no fluid was left in the abdominal cavity.

Case 2.—Cyst of Vulvo-vaginal Gland.

The first patient whom I present to-day is Minnie S., a native of Germany, and twenty-six years of age. She has been married four and a half years, and has had three children, but no miscarriages. Her youngest child is now fifteen months old; and she tells me that it is three and a half years since she first noticed that anything was wrong with her. At that time she discovered a little lump, about the size of a bean, at the entrance of the vulva. This afterward increased in size, until it reached the dimensions of a hen's egg, and it has remained up to the present time. As one might naturally expect, it has given her a great deal of trouble, in coition, pregnancy, and parturition, and has always been a particular annoyance to her in walking; so that she is extremely anxious to get rid of it, if possible. This is in reality a very simple case, but the affection here present is one that is exceedingly liable to be misunderstood; and I want to impress its characteristics so forcibly upon you that you will never have any difficulty in recognizing, or be at a loss as to the proper treatment of, any similar one that you may meet in your practice.

When I made an examination here, I discovered just within the left labium majus a cyst of the size and in the position which I now represent for you upon the blackboard. This, as I said, has given her a great deal of pain and trouble, for three and a half years, and yet, although she has consulted medical advice, it is still as bad as ever. She states that she has been to two physicians, and that they opened the lump and let out matter. Since then, she says, it fills up all the time, and she has to squeeze it out every day.

Now let me tell you what this cyst is. In each labium majus there is a gland of about the size and shape of an apricot seed, which secretes a glairy sort of mucus and pours it out through a little duct opening exactly behind the hymen. On the cadaver a bristle can readily be inserted into the orifice of the duct. These constitute what are known as the vulvo-vaginal glands, and are sometimes called the glands of Bartholine. About twenty-five years ago they were described by a French observer, Huguet, and in honor of him were given his name; but not long afterward it was discovered that a detailed account of them had been given to the profession hundreds of years before, by an old anatomist named Bartholinus.

They are so easily recognized that almost any dissector ought to have detected their presence, and yet their existence was wholly forgotten from the time of Bartholinus to that of Huguet. Thus it is that discoveries are constantly repeating themselves in medicine, and we often hit upon some idea which we imagine to be entirely new, when in reality it was well known to our forefathers. Still I have not told you what the trouble is here. These glands are not infrequently the seat of inflammatory action which is transmitted to them by means of their ducts, just as the testicle often becomes swollen in gonorrhœa, on account of an irritation conveyed from the urethra through the *vas deferens*. So here the vulvo-vaginal gland on the left side became affected through an inflammatory process, which caused stenosis of its duct and created an abscess in the gland itself.

In many works on surgery you will find an elaborate description of the method of cutting out this gland; but let me advise you never to attempt it. I once performed the operation, but it is a very difficult one, and I never expect to do it again. The principal trouble in it is that one is almost sure to sever a branch of the pubic ar-

tery, and it is very difficult to control the hemorrhage which ensues. You will think, perhaps, that you have secured the vessel; but when you call to see your patient the next day it is more than likely that you will find that she has been losing an enormous quantity of blood. In my experience the extirpation of the gland is an utterly useless operation. In the present instance the two physicians made incisions into the cyst; but that was by no means sufficient to effect a cure.

The proper method of proceeding in such a case is as follows: The patient having been well anæsthetized, let an assistant seize and make firm compression upon the enlarged gland. Then further securing it by means of a tenaculum, lay it open with the scissors throughout its entire length, from above downward. Having done this, you should pack it completely, with thymolized or carbolized cotton, or if you please, cotton that has been saturated with a solution of persulphate of iron. In forty-eight hours this dressing should be removed, and the surfaces may then be brushed over with persulphate of iron, so that they will not unite too soon. There is then no further trouble, because the cyst will become completely obliterated in a short time. The result is perfectly certain, and I can promise our patient here, with the greatest assurance, that if she will return to the clinic next Friday, to have the operation performed, she can be entirely cured without the slightest difficulty.

Case 3.—Phlegmon in Douglas' Cul-de-sac, from Recent Pubic Peritonitis.

Elizabeth B., a native of the United States, and twenty-four years of age. She has been married nine years, and has had one child and a number of miscarriages. Two weeks ago she had the last miscarriage, and afterward she was quite ill, and suffered a great deal of pain, which her physician told her was due to inflammation of the bowels. She still continues to feel considerable pain, and is also suffering from weakness and loss of appetite, she says.

On making an examination in this case I found the vagina somewhat relaxed, as we would naturally expect to find it so soon after a miscarriage, and my finger easily passed up to the cervix, which was in its normal position. When conjoined manipulation was employed, I ascertained that the body of the uterus was also in good position; but just behind the organ was a hard lump, which was quite large and exquisitely sensitive to the touch, so that the patient could not keep from wincing during the examination, on account of the pain it caused her. The uterus was found to be moderately movable; but the mass behind it (which was in immediate juxtaposition to it) could be moved but very slightly.

The first question that occurs to any one who discerns such a mass is this: is it a fibroid? But this cannot be a fibroid, from the fact that she was perfectly well up to two weeks ago, when she had the attack of so-called inflammation of the bowels. It it were a fibroid, why should it become developed or begin to give rise to trouble so suddenly? If such were its character, there would undoubtedly have been symptoms before. Then, again, if simply a fibroid, why should it be so sensitive (this tenderness on pressure being exceedingly rare in fibroids), and why should it not move as freely as the uterus, being in reality a portion of that organ?

What else, then, might it be? Not a cyst of the ovary; for in that case it could readily be pushed up out of the pelvis, and this is impossible here. Neither can it be a mass of fæces in the rectum, for if it were so, a depression could be made in it with the finger, which would remain afterward, and would be appreciable by passing the hand over it; just as the feet and legs will pit on pressure when œdematous. Such is not the case, however, with this mass. If it is none of these, what, then, is it?

Just between the rectum and the uterus there is a pouch which is known as Douglas' cul-de-sac. As a result of the abortion mentioned, this patient has undoubtedly had an inflammation of the peritoneum in this part; and it is just this sort of peritonitis which causes the death of many women after miscarriages, although to septicæmia, also, is to be attributed a considerable portion of the mortality occurring under these circumstances. In consequence of the inflammatory action, an effusion of organizable lymph was poured into Douglas' cul-de-sac, and as it is still there all the pain and distress are fully accounted for.

As to the prognosis in this case, I should be perfectly willing to tell the patient that she will be well in from four to six weeks, if she will only take proper care of herself. She should also be warned not to consult any other medical man, for if she goes around from one physician to another, and one or more of them should introduce a sound into the uterus, a second attack of peritonitis might be set up, which might be even more serious than the first. Nothing would have induced me to pass even the delicate uterine probe in this case, for fear of doing irreparable mischief. The patient should keep in bed, or, at all events, in a reclining posture, as much as possible, and especially at the time of her menstrual period. She should also keep her bowels pretty free, by means of laxatives, and should make use of copious vaginal injections of warm water. In a month, if this course is pursued, I believe that the mass of lymph, if not altogether absorbed, will give her so little trouble that she will feel perfectly able to go about all her usual avocations. There is one question which arises, in connection with this case, and that is, whether the abortion was artificially induced or not; for the symptoms here certainly resemble very closely those which not unfrequently exhibit themselves after an induced abortion. (By this time the patient had left the room.)

Case 4.—Probable Fibro-cystic Tumor of the Uterus, Complicated with Pregnancy.

Isabella W. born in Ireland, and thirty-six years old. She has been married three years, and has had one child. This patient first presented herself at the clinic in June last, and the diagnosis was then made of utero-fibroid cyst, together with probably commencing pregnancy. She was directed to return in July, and it was then determined positively that she was pregnant.

As to the cyst, which was also present, it could not be determined with certainty whether it was ovarian or of a utero-fibroid character, although the probability was that it was of the latter variety.

She now expects to be confined next month, and I would call your attention to the enormous size of the abdomen, in which the uterus with its living contents can be made out in the upper portion. Were a woman as large as this in pregnancy, without any tumor, which is here present in addition, I should be very much afraid that she was troubled with dropsy of the amnion. The patient states that she feels the movements of the child distinctly, and when I ask her how long she has had the abdominal enlargement, she replies four years before her pregnancy, which was no doubt one of the points which induced us to suppose formerly that it was probably a fibro-cyst. The average duration of cysts of the ovary is, as I have had occasion to remark before, just about three years.

The question of most importance that arises in connection with this case is, is this tumor going to interfere with delivery? I imagine not, because there is no obstruction resulting from it, either in the pelvis or vagina. It may probably, however, interfere somewhat with the third stage of labor, by preventing tonic contraction of the uterus, and so give rise to considerable hemorrhage.

There are two or three points relating to such a case as this to which I should like to call your attention before dismissing it. The first is, that the most serious mistakes have not unfrequently been made in regard to the diagnosis of tumors complicating pregnancy. In some instances both ovaries may be affected, and the great danger always is that pregnancy may be overlooked altogether. Wherever there is any doubt whatever in a case, therefore, the most extreme care should be used in making the diagnosis.

The next is, as to how a cyst is to be dealt with when it is found as a complication of pregnancy, and vice versa. In the first place, it may be deemed advisable to tap the cyst. Secondly, it may be best to empty the uterus and allow the cyst to remain undisturbed. Thirdly, both cyst and uterus may be left alone until the term of utero-gestation is completed; and this is what has been done here. No one course is always to be pursued; but in every case we should be guided by the individual circumstances of it, as to which plan we shall follow. Some years ago I saw in Jersey City a patient who, like the one now before us, had two tumors in her abdomen, one physiological and the other pathological. She objected to having any interference made in her case, and in the eighth month of her pregnancy the cyst (which was ovarian in character) ruptured; the accident giving rise to fatal peritonitis. In this instance the walls of the cyst were probably unusually thin, and there was not enough room in the abdomen for the accommodation of the two large masses. In some cases the dyspnœa of the patient becomes so great under these circumstances that it is necessary to resort either to tapping the cyst or to emptying the uterus, in order to relieve her.

Before the patient leaves the room I would call your attention to her facies. You can at once perceive that she is very haggard and worn, and that something decidedly more serious than ordinary pregnancy must be the matter with her. Now that she has withdrawn, I will tell you frankly that I look upon the danger of the woman as very great in her approaching confinement. In the first place, she is in danger on account of her extreme exhaustion, and secondly, there is the strongest probability that serious or even fatal hemorrhage may occur in the third stage of labor.

Case 5.—Laceration of the Cervix, with Subinvolution of the Perineum.

Our last patient to-day is Rosanna McG., native of Ireland, and thirty-eight years of age. She has been married eighteen years, and has had ten children, but no miscarriages. (This is quite remarkable, for it is certainly very rare to find a woman who has borne as many children as she has, and yet has never had any miscarriages.) Her last child is now eighteen months old.

How long has it been since anything has been the matter with you? "Fourteen years." Of what do you complain? "Of my back and side (placing her hand over the left hip) and bearing down pains." How are you troubled in the back and side? "I suffer from them all the time when I stand up." Does it hurt you to lift or carry any weight? "Yes; very much." Now, I will put a few direct questions. Do you have the whites? "Very bad." Do you differ much at your monthly periods? "No." You have no trouble, then? "None at all." Do you have any difficulty about your bladder? "No."

There is one other symptom of which the patient has told me privately, and that is painful coition, or, as Barnes has termed it, dyspareunia. It is a very prominent one in the case. The symptoms, then, are, in brief:—

1. Severe pain in the back, increased when any marked exertion is made, and accompanied by "bearing down."
2. Pain in the left side.
3. Leucorrhœa.
4. Dyspareunia.

Such being the symptoms, it becomes an all important question to the patient whether she can be cured.

Having obtained the history, as it has now been given to you, I instituted a physical examination, not for the purpose of finding out a number of interesting pathological facts, but to discover what was the matter with the patient, in order that something might be done for her relief or cure. As soon as my finger had passed into the vagina, I detected the fact that the cervix was very severely lacerated. Not only was it torn through on each side, but, in addition to this lateral division, there was a deep slit down the anterior wall of the cervix. It is impossible now to say whether this extensive laceration was all accomplished at the time of one labor, or whether it was the result of more than one.

There is one peculiarity about this cervix, which is never met with when the part is in its normal condition, and that is, that the moment

the finger touches it the patient knows of it, from the marked pain which it excites. This tenderness is not uncommon in lacerations of the cervix, just, as it is quite frequently associated with ruptured perineum. In certain cases a neuralgic condition of the part ensues, from injury inflicted during parturition, and, being aware of this fact, the cause of the dyspareunia which has been noted in this patient is at once apparent. We can already say, therefore, that if we cannot do anything else for the patient, we can certainly cure her dyspareunia. As sure as the pain occasioned by having a pebble in one's shoe can be relieved by the removal of that pebble, just so surely can the suffering caused by coition in this patient be abolished by an appropriate operation upon the lacerated cervix.

Now let us go on a little further. As the examination was continued, it was found that the patient's perineum was utterly worthless. It had been ruptured to a certain extent, but besides this it was evident that in some of her numerous labors it had not undergone involution, and consequently, it was not difficult to see that the "bearing down" of which the woman complains was due to this cause. The term bearing down ought properly to mean something like tenesmus, but our patients use it to describe a number of different feelings. Here a sense of dragging and giving way in the pelvic organs seems to be meant, and this is undoubtedly due to the abnormal condition of the perineum. Instead of affording support to the walls of the vagina, and through these to the uterus and bladder, all these parts are permitted to drag down to a certain extent, and hence the great discomfort which the patient experiences in consequence.

As to the pain in the back, that is satisfactorily explained by the dragging upon the utero-sacral ligament (one of very great importance), which is kept continually upon the stretch. To any one who understands the anatomy and physiology of the parts, it is not difficult to see how the tension produced by the down-coming uterus should give rise to a constant backache.

Finally, how about the leucorrhœa? When a speculum is introduced, pus can at once be seen pouring out freely from the lacerated surfaces of the cervix, the secretion of whose innumerable glands has become completely perverted. This discharge is not pure pus, but is of a muco-purulent character. When we remember that Tyler Smith has estimated the number of muciparous follicles in the cervix at ten thousand, we need not be surprised that there is a considerable discharge from them under such conditions as are here presented.

Sufficient has now been offered, I think, to account in a satisfactory manner for all the symptoms that have been noticed in the case, and the only thing that remains for us to do is to adopt the best measures for the cure of our patient. The first procedure to be undertaken is undoubtedly the sewing up of the lacerated cervix, which will restore it to its normal condition, and effectually get rid of both the dyspareunia and the leucorrhœa. Having done this, the completion of the cure is to be effected by repairing the perineum, or, in other words, putting back the perineal body, which has been destroyed. When this has been accomplished, instead of the anterior wall of the vagina being pulled out, and the posterior wall rolling out of the body, all the parts will be kept up perfectly in position; and we shall then have the satisfaction of discharging the patient, completely relieved of all the troubles which are now so distressing to her.

Periscope.

Smallpox and Great Pox.

The occasional similarity of syphilis to variola, which has led to their bearing a common name, is well illustrated by the following cases, given by Mr. Jonathan Hutchinson, F.R.C.S., in a recent lecture:—

One of the most remarkable examples of this eruption came under my notice about twelve years ago. A young gentleman called on me with a conspicuous papular eruption on his face and other parts. "I have just had smallpox," he said; "and Mr. —— says that I am cured; but the spots don't go away." He added that Mr. ——, a gentleman of large experience, had kept him in bed a fortnight, and had since sent him into the country for a fortnight, and now said that he might return to his desk at a bank; "but," he continued, "the other clerks won't sit near me, and declare that I have smallpox still." He had a chancre, and the eruption was syphilitic. I have seen several cases which had been treated in the smallpox hospital for eruptions which were undoubtedly syphilitic. But I must not mention the mistakes of others, unless I am prepared to be candid about my own. I had many a time, in clinical lecture, mentioned the preceding facts, and enlarged upon the importance of distinguishing between the syphilitic simular of smallpox and the reality, when my own turn came. One day in the summer of 1877 I was hastily summoned to see a gentleman at his own house, who had just been landed from a sea voyage, during the whole of which he had been very ill. He had been carried from the vessel to his house, and put to bed; and I found him covered from head to foot with crusts exactly like those of variola in the third stage. Some had fallen, and where this had happened, deep scars were left. The eruption had begun to come out on the day that he went on board, and he had been feeling ill a few days before. The stages had been unusually long, but still had not

exceeded possible limits. I questioned him as to syphilis, and examined his penis and his throat, but without finding any reason to doubt his denial. In a word, after a careful and skeptical investigation, I thought that the eruption was variola. The sequel proved that it was syphilis; the scabs took months to fall; and just when he was recovering from the eruption he had iritis, which I could not doubt was specific. At this stage, three or four months after I had seen him at home, in bed, he came to Moorfields Hospital. His face was pitted all over, and I had much difficulty in convincing those who then saw him that he had not really had smallpox. I could not quote an instance more conclusive in support of the assertion that one of the forms of syphilitic eruption is exactly like smallpox in all its stages, and in its resulting scars. Slow progress is the one difference between the two exanthems. The similarity is produced, no doubt, by the fact that syphilis in these cases attacks precisely the same anatomical structures as those in which the variolous pustule is developed. It is scarcely needful to remark that this form of eruption always occurs in the secondary stage.

Treatment of Diphtheria.

Dr. A. J. Shaffer writes to the Atlanta *Medical and Surgical Journal*—

In 1877 diphtheria prevailed to an alarming extent in and along the lines of Hall and Gwinnett counties. I prescribed for a great many cases, and not one case that used the following prescription ended fatally:—

To a child six years old I gave six grains of sulphate of quinia and four drops of hydrochloric acid every hour, until the symptoms gave way, diminishing or increasing according to the age of the patient. In a large majority of cases the grave condition was improved, and the little patient passed into a quiet, refreshing sleep.

℞.	Sulph. of quinia,	gr.xlviij	
	Hydrochloric acid,	♏.xxxij	
	Water,	f.℥j.	M.

Sig.—One teaspoonful to be given every hour, until the grave symptoms give way.

The following is the easiest way to give the medicine, and more palatable for a child:—

℞.	Sulph. of quinia,	gr.vj	
	Acid hydrochloric,	♏.iv	
	Honey, half teaspoonful.		M.

Sig.—Repeat the dose every hour, in severe cases, until the symptoms give way.

Irritation of the Sympathetic, through the Pharynx.

A valuable suggestion is taken from Dr. Bitot, in a translation in the N. Y. *Med. Journal.* Dr. Bitot emphazises the favorable effect of cauterizations of the pharyngeal mucous membrane in cases of cranial neuroses with amnesia, due to affections of the superior cervical ganglion of the sympathetic. His conclusions are: 1. The head is the seat of certain nervous derangements whose localization has not yet been determined. 2. In these the cranial portion of the sympathetic must participate. 3. The assumption is justifiable, that the superior cervical ganglion of the sympathetic, which forms the chief seat of the derangement, is the starting point. 4. When this neurotic condition resists the usual therapeutic measures, the relations of this ganglion to the pharyngeal mucous membrane make the latter especially adapted to the counter-irritation. 5. The application of iodine to this mucous membrane has furnished remarkably favorable results in essentially nervous derangement; on the other hand, it is inert in the consecutive phenomena of apoplexy. 6. Under this treatment many of the cases complicated with amnesia have regained the power of memory.

Effects of Quinine on the Organs of Circulation.

An Italian observer, Dr. G. Cavazzani, has studied this subject recently, and his observations are given in the London *Medical Record.* He finds that the action of quinine upon the heart is not very marked, but if it is contracting very rapidly, the muscle becomes pale, the cavity is completely emptied, the heart remains contracted in systole. The ventricular diastole occurs slowly, so that the auricles impel but little blood. Quinine causes great constriction of the arterial and venous capillaries, the constriction bearing a definite relation to the amount injected. The circulation of the blood corpuscles is hindered in many of the capillaries, but the author has been unable to decide whether the circulation of the plasma likewise ceases. In moderate doses quinine may accelerate the peripheral circulation, while in larger quantities it impedes, by reason of its constricting action upon the terminal vessels. Quinine has a paralyzing influence upon the respiration. From these observations it may be deduced, *à priori*, that quinine in considerable doses is of use to stimulate the peripheral circulation by limiting the vascular area. In energetic doses it is useful in phlogosis by modifying vaso-motor paresis.

Œdema of the Feet and Legs in Consumption.

Dr. Pachot, of Paris, in a recent *Thesis*, states that œdema of the lower limbs may arise in consumption from different causes, the principal of which are renal alterations, amyloid degenerations, tuberculosis, venous thrombii and cachexia. Another form, which has not been much studied hitherto, is due to irregularities in the cardio-pulmonary circulation which originate in chronic peritubercuious pneumonia.

This latter complication has been noticed as well in the above-mentioned case as in a simple chronic pulmonary induration; the œdema is persistent, not painful, and does not increase the cachectic state of the patient to any extent. In all the cases quoted by M. Pachot, the sclerosis of the lungs was very considerable, and continued with a considerable thickening of the pleura. The right ventricle has never been dilated, although dilatation has often occurred, together with hypertrophy, in simple broncho-pneumonic cirrhosis.

Nitrous Oxide in Asthma.

Dr. D. Crofton has an article in the *Med. Press and Circular*, on the therapeutic effect of the inhalation of the fumes of burning nitre paper in asthma. He writes—

It will be well to examine the method, or presumed method, of relief. This we believe to be due to two factors—first, the effect of the liberated nitrous oxide upon the nervous system, having its secondary effect upon the muscular one, and so relaxing the spasm which contracts the bronchial rings, thereby opening them, and allowing inspiration and expiration to go on freely. Next to this comes the benefit derivable from the oxygen also liberated, which can now, through the enlarged diameters of the tubes, be freely inspired to aerate the blood, and afterward freely expired as carbonic acid and watery vapor.

If our hypothesis be correct, it would appear that nitrous oxide alone (or properly diluted) would produce the beneficial effect, although more slowly, by doing for atmospheric air what it does when liberated from the burning paper for its associated oxygen, and that oxygen alone (or properly diluted) without nitrous oxide, could not be expected to confer the same benefit, as the tubes might remain contracted, and so offer an impediment to expiration of the generated carbonic acid.

In illustration of these two positions, we have heard a remarkable instance. A young geologist of our acquaintance, happening in India to live in the house with an old gentleman who was asthmatic—upon the latter being seized with an attack at night, made a bagful of nitrous oxide, which he caused the patient to inhale, and which brought immediate relief. Subsequently, on another attack occurring, he gave him oxygen, but with little or no benefit.

In what we have said about nitrous oxide, we have spoken of it in its topical, or presumed topical effects. Its constitutional action should also be taken into account. This is known to be great, from the symptoms which it produces when inhaled by healthy persons, in whom it often brings on the effects of laughing, pugnacity, etc.

Reviews and Book Notices.

NOTES ON CURRENT MEDICAL LITERATURE.

——Part II of the Atlas of Histology, by Dr. E. Klein and E. Noble Smith, is taken up with endothelium, and presents several plates, containing figures drawn and colored in the most exquisite style of the art, and with a fidelity that leaves nothing to be desired. For sale by J. B. Lippincott & Co. Price $2.50.

——"Rhymes of Science," is the title of a collection of humerous poems relating to various branches of science, and by different authors, collected and published by the Industrial Publication Co., New York City (small 8vo, pp. 66, cloth, price 50 cents). Dr. O. W. Holmes, Bret Harte, J. G. Saxe, and others, are represented.

——In Circular No. 1, 1879, of the Bureau of Education, Washington, the Hon. John Eaton, Commissioner, prints an address to the Training School for Nurses in that city, summarizing much of the information desired from that office by those who seek to promote the establishment of such schools. To be had of the Commissioner.

——"Neurological Contributions," by William A. Hammond, M.D., assisted by W. J. Morton, M.D., is the title of a publication issued by G. P. Putnam's Sons, New York city, the first number of which is before us. Four numbers are to be issued yearly, each of 96 pages, and each complete in itself, and will be sold for $1.00. The numbers are to be made up of memoirs and reports on subjects connected with the mind and nervous system, by the two gentlemen mentioned, and will be freely illustrated. The first number contains articles on the non-asylum treatment of the insane, on arrest of development, on mysophobia, and a series of records of practice, by Dr. Hammond, and various clinical cases, by Dr. Morton. The description of the toxic effects of tea, by Dr. Morton, is a very valuable report. The essays by Dr. Hammond are able and lucid, as we should expect; his description of mysophobia is very striking. The paper and presswork are exceptionally fine, and the publication deserves popularity.

——The first annual report of the State Board of Health of Rhode Island makes a volume of two hundred pages. About one half is occupied with the report of the Secretary, Dr. Charles H. Fisher. It is followed by papers on hygiene in the public schools, by Dr. George W. Jenckes; on the dangers arising from poisonous wall papers, by Dr. E. Dyer; on the prevention of kerosene accidents, by Prof. J. H. Appleton; on the medical topography of Rhode Island, by Dr. Charles W. Parsons; on diphtheria, by Dr. James H. Eldredge; on causes of ill health among women, by Dr. Anita E. Tyng; a one-sided attack on beer and wine as table drinks, by Dr. L. F. C. Garvin; and a study of the causation of typhoid fever, by George E. Waring, Jr. Several of these papers are not above the common place; and it is to be hoped that future volumes, instead of being made a medium for trite writers to air pet theories of a narrow character, will become the receptacles of able and scientific investigations.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	**$5.00**
Half-Yearly Compendium of Med. Science,	**2.50**
Reporter and Compendium, - - -	**7.00**
Physician's Daily Pocket Record, - -	**1.50**
Reporter and Pocket Record, - - -	**6.25**
Reporter, Comp. and Pocket Record, - -	**8.25**

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

D. G. BRINTON, M.D.,
115 South Seventh Street,
PHILADELPHIA, PA.

REMARKS ON COMPARATIVE EPIDEMIOLOGY.

The diseases of the lower animals are receiving at present a great deal of attention from legislators in this country. The immense pecuniary interests at stake have led to the necessity becoming more and more apparent, that these diseases must be studied in a scientific manner, and the most enlightened sanitary and therapeutic means be adopted to prevent and cure them. Every year the United States is looked to more and more, by Europe, as the source of its food supply, and there is no economic point of greater importance for our future welfare than to secure and maintain this position.

England, Germany and Norway have this spring passed laws forbidding the introduction of American beef "on the hoof," on account of the prevalence in the Atlantic States of an infectious disease of cattle, called "pleuro-pneumonia." Of this disease we gave a description last week, from the pen of an able veterinary surgeon. The need of such a description is only too apparent from the discussions of the bills which have been introduced into the legislatures of Pennsylvania and other States to authorize measures to "stamp out" the disease. Not only did various lay members, but actually several who were physicians arose and argued that because pleuro-pneumonia in the human subject is neither contagious nor infectious, it certainly could not be among cattle, and hence they opposed the bill! The ignorance they thus exposed is, we are afraid, too general among the profession. It illustrates what we have before stated in reference to the importance of medical men acquainting themselves with comparative pathology and comparative epidemiology. At any rate, until they have given some study to these subjects, it is to be hoped, for their own credit and the good of the people, they will keep quiet in legislative halls and other public places.

The public naturally expects of a physician that he has studied the great subject of *Disease*; not merely disease of this or that character, in this or that species, but in a general way, as the deviation of organic life from its normal progress. Only when a professional man takes this wide and philosophical view of his profession, does he deserve to have it said of him that he has studied it profoundly, that he knows it thoroughly; only from such thorough and general knowledge can we expect to arrive at those fundamental laws of aberration from normal development, an acquaintance with which will confer upon us the mastery of diseased processes.

Hence, we hail as one of the good signs of the times that various medical schools, the University of Penna. among the number, contemplate adding to their course of instruction a department for the teaching of veterinary or comparative medicine and surgery. We need such an addition to the curriculum; the profession needs it, the country needs it.

For this reason, without designing or intending to depart from the range of topics strictly connected with practical medicine, we have at various times introduced discussions of veterin-

ary subjects. If we required a defence for this, we could easily find it in the debates last month in the Legislature of this State, on the Bill to prevent the spread of pleuro-pneumonia. The confusion and want of knowledge which prevails on these subjects among medical legislators were there made apparent. We hope that our endeavors will lead readers to acquaint themselves sufficiently with such subjects to avoid a public display of their ignorance when these topics are brought forward for public discussion.

Notes and Comments.

Therapeutical Notes.

CREASOTE IN CONSUMPTION.

Dr. Bonnefontaine recommends to consumptives creasote, in the shape of Dartais' capsules. These are very small globules, containing each about five centigrams of creasote, and quite tasteless. The drug must be taken three times a day, before every meal, in doses of three globules each time, and followed by a cup of chocolate or milk, a glass of wine, or some soup.

BROMIDE OF POTASSIUM IN CROUP.

In the *British Medical Journal*, February, 1879, p. 234, Dr. Redenbacher reports two cases in which this agent apparently produced most valuable results. Two little girls, aged respectively five and seven, were ordered the drug, combined with small doses of bromine. When next seen the change was most marked, and death, that seemed imminent, was averted. Dyspnœa had passed, expectoration was free, and pieces of croupal membrane were coughed up, perfect recovery following in a few days.

Rabies Treated and Cured by Oxygen.

We learn, says the *Medical Press and Circular*, from the *Gazette des Hôpitaux*, that two Russian physicians, Schmidt and Lebedew, have lately cured, by the above means, a young girl, aged twelve, who had been bitten on the hand by a mad dog. The wound had engaged the skin and subcutaneous cellular tissue, and had been immediately cauterized by nitrate of silver; and at the end of eight days cicatrization was complete.

Seventeen days after the bite the first symptoms of hydrophobia developed. The physicians prescribed the inhalation of oxygen, with the result of producing a complete state of calm. On the next day fresh symptoms came on—dysphagia, dyspnœa, tonic convulsions, spasm of the respiratory muscles, and complete absence of sensibility. A fresh inhalation of oxygen, for forty-five minutes, relieved all the symptoms, with the exception of a slight degree of dyspnœa, which was overcome by the use of the monobromide of camphor. The patient ultimately recovered.

Treatment of Diarrhœa by the Hot-Water Douche.

The London *Medical Record* informs us that Dr. Schorstein, of Vienna, advises the application of a douche of hot water, under strong pressure, to the umbilical region, in cases of diarrhœa. The temperature is at first 50°, but may be raised to 72°. The duration of the application lasts from three to five minutes; after it the patient takes a hip bath of 50 to 62°. This treatment is generally repeated not more than twice daily. Dysenteric diarrhœas, combined with tenesmus, and dysentery itself, if not inveterate, are treated in the same way. The effect is very rapid, and lasts much longer than opium treatment does; the pain is also calmed very quickly. The author has also found this hot douche answer in cases of colic caused by biliary calculus, many kinds of neuralgia, sciatica excepted, where it was desirable to remove renal calculi and gravel, or long accumulated fecal matter.

Iron as a Blood Enricher.

We have read the reprint of an article by Dr. Robert Amory, of Longwood, near Boston, Mass., originally published in the Boston *Medical and Surgical Journal*, on the subject of the hæmatinic properties of dialysed iron. It is not only interesting in itself, as an instance of one of the vastly improved methods of modern research, but as affording striking evidence of the value of iron as a therapeutic agent. Twenty-eight heliotype plates of specimens of blood microscopically examined, before and after the exhibition of this remedy, enable the reader to judge for himself of the results arrived at; another illustration of the recent improvement in the means of promoting science.

Moreover, this article aids us in determining as to the best form in which this drug may be administered so as to obtain its tonic effect; and explains, in the variable quality of the article as furnished, why it has sometimes disappointed the expectations of those who have prescribed it.

Dr. Amory's testimony to the efficacy of this excellent analeptic is based upon observations made with the preparation furnished by Messrs. Wyeth & Brother, of this city, whose form of dialysed iron has met general commendation.

Correspondence.

Jaborandi in Night Sweats.

Ed. Med. and Surg. Reporter:—

About one year ago, Dr. Charles H. Weikel, then Resident Physician in the Philadelphia Hospital, told me that they had been using in that institution jaborandi for the purpose of stopping the night sweats of phthisical patients, and almost invariably with success. Since then I have prescribed it with the same intention in four cases, and Dr. S. Mason McCollin tells me that he has employed it lately in three of his cases. In all these cases, with the exception of one, the night sweats ceased after the first dose, almost totally. As mentioned, it had no effect in one of my cases, but here I think its employment came too late, as the individual died a few days later. The way I used it was the following:—

℞. Extracti jaborandi fluid., f. ℥ ss
Tinct. cardamomi,
Syrup. pruni. virginian., āā f. ℥ ij. M.

Sig.—One teaspoonful, in half a wineglassful of water, the first night, then half a teaspoonful every following night, until cessation of sweats.

It will rarely be necessary to give the medicine oftener than four consecutive nights. If, after some weeks, the sweats should return, which is frequently the case, one or two of the smaller doses have, in my cases, been sufficient to stop them again. If, after repeated trials, and a larger number of observations, the fact should be established, that jaborandi in small doses always has the effect of suppressing that which it produces when administered in larger quantities, and especially if it should prove, as it seems to do, to be specific against the night sweats of phthisical patients, then we would have one remedy more to alleviate the suffering of those unfortunate beings who fall a victim to the tubercular diathesis. The remedies we know, so far, to stop these night sweats, have all some kind of drawback. Sulphuric acid disturbs rapidly the digestion; the external application of tonic astringents is of no use, and atropia produces such a disagreeable dryness in the throat, and after a few doses, frequently, such an exhausting diarrhœa, besides its effects on the eyes, that we would have won in jaborandi a really very valuable addition to our stock of palliative remedies, besides its usefulness in many other diseases where a strong diaphoresis or increase of the salivary secretions is our object. What dose of the muriate of pilocarpia, hypodermically, might be necessary to stop these sweats I am not able to say, having found no occasion yet for using jaborandi in this form, but I should judge one-thirty-second of a grain might answer the purpose.

There is another remedy which is often used in the Philadelphia Hospital, and which, outside of that institution, is very little employed, and almost considered obsolete. That is the fluid extract of hamamelis. According to my experience with this drug, it is far superior to ergot, gallic acid, terebinthine, cupri sulphas, plumbi acetas, and all others recommended against hæmoptysis. The fault that it might have occasionally disappointed in its effect, lies in the dose and not in the medicine. In cases of hæmoptysis I give two teaspoonfuls of the fluid extract of hamamelis right away, and repeat the dose every half hour till the severe bleeding stops, and continue it later, in the dose of one or half a teaspoonful three times daily, until all signs of the spitting of blood have disappeared. I have seen no remedy yet so certain in its effect as hamamelis, and I mention it here to induce others to try it. If hamamelis is used in the following way, patients like to take it:—

℞. Extract. hamamelis, fluid, f. ℥ iij
Tinct. radicis aconiti,
Acid. hydrocyanic., dilut., āā ♏ xv
Extract glycyrrhiz., fluid, f. ℥ ss
Syrup. limonis, f. ℥ vij. M.

Sig.—One to two teaspoonfuls, in water, three times daily, or as directed.

Hugo Engel, A.M., M.D.
319 *North Fifth street, Philadelphia.*

Pneumonia in Mississippi.

Ed. Med. and Surg. Reporter:—

We have just passed through what we call the pneumonia season, the unusually long, cold winter, and the unguarded habits of our people, working up many cases through the country. Capillary bronchitis, or catarrhal fever, croup, coryzas, bilious remittent, and so-called typho-malarious fevers prevailed in some districts to an alarming extent, especially among children. Fortunately, however, they have been quite amenable to treatment, few cases having died when treated in time and properly nursed. In this country we expect all the forms of malarial fever in the summer and fall, but it is something very unusual for them to continue with such severity through the winter. As to treatment, that which was earliest and most accurately directed against the biliary and gastric complications, even when there were lung troubles, together with counter irritation, seemed to succeed best.

Dialysed Iron as an Antidote to Arsenic.

Ed. Med. and Surg. Reporter:—

An elderly gentleman and his wife were poisoned, last week, by arsenious acid put in their coffee, from which they suffered very severely. Mr. C. drank a cup of the coffee, and also a glass of sweet milk, at the table, and immediately after rising from the table he drank two more glasses of milk, with cream, not apprehending poison. In less than thirty minutes he became sick, nauseated, and threw up his dinner. Supposing he was bilious, or had eaten something indigestible, he took a dose of calcined magnesia, and soon threw that up, then drank a solution of soda carb., which was likewise thrown up. Mrs. C. was also seized with nausea and vomiting, when a physician was called in, who treated

the nausea and irritability of the stomach, not apprehending poison, for the lady was not well before taking the poison. Mr. C. did not suffer many hours, as he had unwittingly taken three very good remedies. Mrs. C. was extremely prostrated; she is about sixty years old, and in poor health generally. The poison was taken on Monday, at noon, and she continued to vomit and suffer till Thursday, when I sent her, in the evening, two ounces of dialysed iron, prepared by Wyeth, of which she took nearly a fluid drachm, and experienced great relief in a few moments. She repeated the dose before bedtime, and rested better than she had since Sunday night. I saw her on Friday, when she was able to sit up, and expressed her thanks for the medicine, and the prompt relief it gave her, for she vomited no more after the first dose. She continued to use the iron till restored to health.

Navasota, Texas. A. R. KILPATRICK, M.D.

NEWS AND MISCELLANY.

AMERICAN MEDICAL ASSOCIATION.

THIRTIETH ANNUAL MEETING.

The Association met at eleven o'clock, May 6th, the President, Dr. Parvin, of Indianapolis, in the chair. Prayer was offered by the Rev. Dr. Gwinn. Dr. J. P. Logan, of Atlanta, Chairman of the Committee of Arrangements, followed with a cordial and happily phrased address of welcome, from which we make the following extract:—

"Let me beg you not to be precipitate in leaving us, but look into the mystery of this town; and in accordance with one of the most prominent characteristics of our people, who are always looking out for population, and as it must be supposed that we have a great deficiency of medical men, from the constant accession to our numbers, I would suggest that we may yet claim many of you as our fellow citizens.

"To you, as physicians, it must be interesting to know that there is found an almost entire exemption from malaria and tuberculosis (originating in this region), as well as freedom from any apprehension of a visitation of the awful scourge to which so many of our southern towns have been subjected. Our gates have time and again been thrown wide open to the fleeing thousands, who have found safety from pestilence, and sympathy with misfortune, the benevolence involved, it may be, mixed with the selfishness that springs of a security from danger.

"And this brings me to remark that if we cannot offer you much in the way of attractive recreation, we can at least point you to this favorable opportunity for the consideration of the great question of the hour, upon the wise solution of which depends the most momentous and vital interests of health, happiness and treasure to the whole people of this vast country.

"The grand results which have been accomplished in the past in originating and building up sanitary science have been due to the medical profession, and you have now, in addition to the many other important and interesting investigations which demand your attention, in the impress you may make upon the action of the national sanitary body now in contemporaneous session (to which you are invited), accustomed as you are to self-sacrificing toil, an opportunity to engage in a 'labor of love' and a work of mercy, far transcending the gratification of landscape, art or social life, in this solemn period, when the people of a large portion of the land, having just emerged from the ravages of the deadly plague, are now waiting, as it were, on tiptoe, with deep apprehension, the approach of another season which may renew the horrors of the past year.

"As equally appropriate to the present occasion, and to the intervening history of this desolating plague, craving your patience, I have to detain you a moment in repeating a brief extract from what I had the honor to write in the conclusions of a report from the State Board of Health to the Governor and Legislature of Georgia, in the winter of 1876, in reference to the visitation of that year upon our own immediate coast and connecting cities. I then said, and now say with equal confidence, that, 'for all practical purposes, it is not necessary to demonstrate whether yellow fever is always imported, or whether, under certain peculiar and exceptional circumstances, it arises upon our coast from local causes alone. That it can be imported, and will or can become epidemic, from the neglect of proper sanitary regulations in certain localities, will not be questioned. That it may be imported and not become epidemic, in the absence of the circumstances which favor its propagation, will also be admitted without discussion. The very warm contest, therefore, which has been carried on for many years in regard to the exotic or local causes of yellow fever does not seem to be justified by the necessities of the case, or the importance of arriving at conclusions of a definite character with reference to the possibility of excluding it altogether, as an epidemic, from our shores. Let the facts of importation or local origin, or of both, be as they may, no argument is needed to establish the proposition that no means of preventing the occurrence of yellow fever should be neglected, which could, by possibility, be brought into requisition.'"

At the conclusion of the address there was hearty applause. The announcement of the list of registration of members by the Committee on Arrangements was made.

Dr. Logan announced that the citizens of Augusta had tendered the Association an excursion to that city, and the only objection he had to its acceptance was the great beauty of that city.

Dr. Campbell, of Augusta, rose and made a few remarks, urging the acceptance of the invitation, and promised the Association a real old Georgia barbecue. [Applause.] "Some of you don't know what that means, but if you will just come down and see us, we will show you how elegant we can make it. We will not take no for an answer." [Applause.]

Communications from members unavoidably absent were read.

The next business was the annual address of the president, Dr. Theophilus Parvin, of Indian-

apolis. The address was beautiful in words, and deep in thought, and was received with frequent applause.

On motion of Dr. Logan, the ex-presidents of the Association were invited to seats on the stage. In response, Dr. Davis, of Chicago, Dr. Gross, of Philadelphia, Dr. Richardson, of New Orleans, and Dr. Toner, of Washington, came forward and took seats on the stage. Dr. Fuller, of Maine, presided during this stage of the proceedings.

Some papers on various medical problems and experiments were offered and referred to appropriate Sections.

Dr. E. Seguin, of New York, presented the report of the Committee on the Metric System. The report briefly sketched the success of the system, and offered in conclusion a resolution, declaring that the Association adopt the metric system, and that in future all correspondents adopt it, and that druggists and physicians endorse and promote its popular use. The adoption of the report and resolutions was moved.

Some discussion was had as to whether the resolutions should be adopted at once or delayed until some absent members should come in. The motion to postpone the consideration of the report was carried.

An amendment to the constitution providing for the consolidation of the Sections on medical jurisprudence, chemistry, and psychology, and the department of state medicine and public hygiene was adopted. The section was placed as number four.

After some further business, the Association adjourned to the following day, the afternoon being devoted to the meetings of the Sections.

[The report of the proceedings will be continued next week, in order to give space in this number for the proceedings of other bodies which met at the same time.]

THE CONVENTION OF AMERICAN MEDICAL COLLEGES.

The Convention met, according to notice, at Atlanta, May 2d. The meeting was called to order by Dr. N. S. Davis, and the chair taken by Prof. S. D. Gross. Dr. Sterling Loveing, of Columbus, Ohio, was elected Secretary. A committee on credentials was appointed, who reported as follows:—

State University of Iowa—Dr. Thomas S. Parr, D. F. Peck.

Starling Medical College, of Columbus, Ohio—Prof. S. Loveing.

Miami Medical College, of Cincinnati—Prof. John A. Murphy.

Medical Department, University of Michigan—Prof. E. S. Dunster.

College of Physicians and Surgeons, of Baltimore—Dr. John S. Lynch and Prof. E. Lloyd Howard.

Kentucky School of Medicine—Dr. A. B. Cook.

Medical Department, University of Louisiana,—Dr. E. S. Lewis.

Woman's Medical College, of Pennsylvania—Prof. Frances Emily White, M.D.

Rush Medical College, of Chicago—Prof. Moses Gunn.

Medical College of South Carolina—J. Ford Prioleau, J. P. Cnazal.

Detroit Medical College—Dr. L. Connor.

University of Louisville—Dr. John D. Crowe, Dr. John M. Bodine.

Vanderbilt University (Medical Department)—D. C. Kelley, of Trustees; Dr. T. Menees, of Faculty; also representing Nashville Medical College.

Louisville Medical College—Dr. C. W. Kelly, Dr. W. B. Fleming.

Medical College of Indiana—Dr. J. F. Hibbard.

Atlanta Medical College—Dr. John G. Westmoreland, Dr. John T. Johnson.

Medical Department, Central University of Louisville—Dr. Dudley Reynolds.

Jefferson Medical College—Dr. Samuel D. Gross.

Chicago Medical College—Dr. N. S. Davis.

Medical College of Ohio—Dr. W. W. Dawson.

Medical Department, University of Maryland—Dr. S. McLean Tiffany.

Southern Medical College—Dr. T. S. Powell, for Trustees.

Medical College of Evansville, Ind.—Dr. H. G. Jones and Dr. G. B. Walker.

Nashville Medical College—Dr. D. J. Roberts, for Faculty, and Dr. Duncan Eve, for Councillors; Judge A. L. DeMass for Trustees.

College of Physicians and Surgeons, of Keokuk, Iowa—Dr. J. C. Hughes.

Dr. N. S. Davis stated the object of the meeting to be the establishment of a uniform course of study, in accordance with the advanced state of medical science. One of the great objects of this Convention was to ascertain if all the colleges in the country could not be induced to take at least one step forward—a step which would require all medical students not only to study three full years, but also to attend three regular annual courses of college instruction. This point must be settled by the Convention. The students should also be required to furnish evidence that they are well educated in ordinary English branches. The latter point is as vital as the former. The doctor said both points were vital, and nothing less would do credit to such a body.

Dr. E. S. Dunster, of Michigan, favored the adoption of the course suggested, and said he spoke for the University of Michigan. That school would adopt such a course, no matter what the Convention should do.

Dr. Davis, of the Chicago Medical College, moved that a committee of five, on propositions, be appointed to bring matters before the body in regular form.

After some desultory discussion, this motion was carried, and the committee was appointed, to report in the afternoon.

At the hour appointed the Committee submitted the following report:—

Your Committee, after due deliberation, have decided to submit for the consideration of the Convention only two propositions, and those without any expression of opinion concerning their merits by your Committee. The propositions are as follows:—

First. That all medical colleges should require attendance upon three regular courses of lectures during three separate years, before admitting students to become candidates for the degree of M.D.

Second. That the medical colleges should require, before admitting to matriculation, a preliminary examination—such examination to embrace, at least, the elements of the physical sciences in addition to a fair English education. All of which is respectfully submitted.

N. S. Davis, *President.*
J. T. Johnson, *Secretary.*

The report was received, and after considerable discussion, was carried, by a large majority. It was also moved and carried, that the report be referred to the Association of American Medical Colleges.

The Convention then adjourned *sine die.*

THE ASSOCIATION OF AMERICAN MEDICAL COLLEGES.

The third annual meeting of this Association was held in Atlanta, May 3d.

At ten o'clock, Dr. N. S. Davis, of Chicago, Vice President, called the meeting to order. He announced the death of Dr. Biddle, of Jefferson Medical College, the late President of the Association, and paid a brief but beautiful tribute to his memory. He hoped that a committee would soon be appointed to prepare suitable resolutions on the death of this distinguished physician and estimable man.

The credentials of the members were presented to the Secretary.

Several amendments to the By-Laws of the Association were presented and acted on, and the members passed to the consideration of the following proposed additional Section to the By-Laws:—

Additional Section to Article VII of the By-Laws: Every college member and every affiliated college shall print each year a true list of matriculants of the college for the year, and their preceptors, or the names of the colleges at which the matriculants have graduated, in the cases of those matriculants who are graduates, and every such college shall also print a true list of the graduates for the year.

The object of this additional section is to provide that every college member of the Association shall have proper means of information with regard to the matriculants and their preceptors, and the graduates of each college.

This additional clause was adopted by the requisite two-thirds vote—yeas, 13; nays, 1.

The charges against the Louisville Medical School were then read, and decided to be null, as they were not brought in in the regular manner, and, moreover, the colleges in question had now so arranged their courses as to be free from the charge of irregularity.

The report of the Committee on Registration of medical colleges in good standing was read. It stated that there were fifty-nine regular medical colleges in the United States, and the grand total of their graduates for 1878, was 2708. The report was full and complete, giving a list of the colleges which were in the Association, and stating whether or not any of them had violated any of the articles of confederation.

The reading of the long report occupied the body until it adjourned for dinner, to meet at three o'clock in the afternoon.

After considerable discussion, a motion was carried, to recommit the report for corrections and presentation again next year. This was deemed advisable, as it reflected severely on several colleges in Louisville and Nashville, whereas those colleges had now so modified their courses as not to be justly chargeable with the irregularities stated.

This was followed by the report of the Secretary, in reference to the reports of the colleges: The total membership of the Association consists of twenty-eight active colleges; twenty of these have reported; there is one affiliating college; five colleges have joined since the last meeting; four applications are now pending.

The points of the reports from the various colleges, and the manner in which they had observed the articles of confederation, were read by the Secretary.

The Secretary stated that the Faculty of Dartmouth Medical College insisted on withdrawing from the Association, because they could not lengthen their term.

The application of Dartmouth College was granted.

A resolution that gratuitous instruction to medical students, by any member of the Association, except as provided by law, be declared unlawful, was adopted.

An adjournment was had until Monday, May 5th.

At the session on that day resolutions of respect to the late Dr. J. B. Biddle were read.

The election of officers being next in order, Dr. Samuel D. Gross, of Philadelphia, was nominated for President, and received fifteen votes, seventeen being the whole number cast. Elected.

Dr. N. S. Davis, of the Chicago Medical College, was nominated for Vice President, and received fifteen votes, nineteen being the whole number cast. Elected.

Dr. Leartus Connor, of the Detroit Medical College, was elected Secretary and Treasurer, receiving fourteen votes out of seventeen cast.

Next in order was the reading of a communication from the "Convention of Medical Colleges." At that convention, as above stated, the questions discussed were: (1.) Should all medical colleges require three regular courses of lectures in three separate years as one of the requirements for conferring the degree of M.D.? (2.) Should all medical colleges require, before admitting to matriculation, a preliminary examination—such examination embracing at least the elements of the physical sciences in addition to a fair English education?

The first of the questions thus referred was disposed of by an amendment to the articles of confederation, proposed by Professor Menees, by which said question was answered affirmatively. Under the rules of the Association the amendment was tabled till the next session. The second of the referred questions was laid upon the table for one year.

The following amendment to act I of the articles of confederation was then offered by Professor Bodine: The majority of the members of one faculty shall not constitute the majority of the members of another faculty, unless the sessions of the two schools are held simultaneously.

The amendment was seconded, and under the rules lies over till next year.

Professor Chaille called from the table the following resolution: That it shall be considered derogatory to the dignity and good standing of any medical college represented in this Association to advertise, in any other than a strictly medical publication, the names of its professors, with their respective chairs.

This resolution does not apply to the annual circulars and catalogues issued by the colleges, but to advertising in non-professional periodicals, newspapers and other like publications, in which only a card calling attention to the advantages of the school, length of session, fees, etc., with the names of the executive officer or secretary appended, should be permitted.

After full discussion by Professors Chaille, Dawson, Murphy, Lankford and others, the resolution was adopted.

Professor Chaille offered the following amendment to the articles of confederation: "No college shall advertise in any other than a strictly medical publication the names of its professors, with their respective chairs." The amendment was seconded and laid on the table till next year.

After some formal proceedings the Association adjourned.

THE NATIONAL BOARD OF HEALTH.

The Board met at Atlanta, May 5th.

The following is a full roll of the members.

President, Dr. J. L. Cabell, of the University of Virginia; Vice president, Dr. J. S. Billings, surgeon of the United States Army; Secretary, Dr. T. J. Turner, of the United States Navy.

Members—Dr. S. Smith, of New York; Dr. H. J. Bowditch, of Boston; Dr. R. W. Mitchell of Memphis; Dr. S. M. Bemiss, of New Orleans; Dr. T. S. Verdi, of Washington; Dr. P. H. Bailhache, of the United States Marine Hospital; Dr. H. A. Johnson, of Chicago. Hon. S. L. Phillips, of the Attorney-general's office, is the legal adviser of the Board. There was a full attendance, except Dr. Bowditch and Mr. Phillips. Many distinguished physicians were present by invitation. Dr. Cabell called the meeting to order, and said:—

"In behalf of the National Board of Health, I desire to say that in asking a conference with leading sanitarians from various States, we were animated by a sincere desire to have the benefit of the counsel and advice, as well as the sympathy, of all whose studies have led them to the investigation of sanitary questions. The constituting act looks to such a course, for after declaring that the board shall consist of seven members from civil life and four from the departments of the United States, it goes on to contemplate and direct a general conference with students of sanitary laws and observers of their action in various parts of the country. The president here read an exposition as to the studies and methods of the Board. He then mapped out the course of a general consultation with sanitarians from all parts of the Union, by which the Board hoped to be more efficacious.

Dr. Billings was asked to read the programme which had been arranged by the committee appointed to prepare a schedule for the present meeting.

He announced that the meeting of the day would be restricted to the subject of a maritime quarantine, and would not touch on those other subjects, which would be reserved for other sessions and separate schedules.

The chair called on Dr. Vanderpoel, of New York, to open the debate. The points touched upon were the sanitary history of a vessel in a foreign port, and its sanitary treatment when it arrives from an infected port. These questions were ably discussed by Drs. Vanderpoel, of New York, Cleemann, of Philadelphia, Howard, of Baltimore, Bemiss, of New Orleans, G. Dowell, of Galveston, Blaine, of Brunswick, and others.

The President announced that Dr. Chancellor, of Baltimore, had offered a paper on "the plague," with special reference to the quarantine. On motion, Dr. Chancellor was requested to read his paper, and he complied. He said the assembly was not to consider one epidemic disease. Last year the yellow fever carried death into the households of the Mississippi valley. This epidemic has attacked alternately the Atlantic coast and then the Mississippi valley. He said there are other dangers than yellow fever. There are cholera and the plague to be dreaded. He had investigated the question of the plague, and wished to bring to notice a danger which might press itself on us within six months. He had different ideas of quarantine from those generally received. The great need is not to stop commerce, but to enforce strict sanitary laws in cities. His paper was an inquiry into the history of the plague, but referred especially to the proper methods of quarantine against it. The position taken in the paper was that no epidemics like yellow fever and the plague are contagious from the person or the clothing. They can only spread when the condition of the air is favorable, and, therefore, there is no reason for a quarantine. The source is back of this. It is in the condition of the cities where the epidemic is to spread. He said the support of a great national quarantine would be stupendous folly if it tried to keep out epidemics by excluding merchandise.

On the following day, among the topics considered were—

1. River transportation.

(*a*) How to secure a steamer freedom from infection at New Orleans.

(*b*) How to deal with steamers at ports along the Mississippi and its tributaries.

These subjects were discussed by Drs. White and Chaille, of New Orleans, Dr. Mitchell, of Tennessee, Dr. Pinckney, of Ky., and others. At the request of several members, Dr. A. N. Bell, of New York, cited the experiments that he had made in heat disinfection. He stated that thirty-one years ago he was called upon to take

measures against the yellow fever on a schooner that came from a point where the disease had been raging two years. For three hours he steamed the ship, under as intense heat as the boilers would give; then he scraped and painted the vessel, and three weeks later no case of sickness was on board. A year later the ship went on a cruise in the worst fever ports of the West Indies, and no case of fever was developed on board. At the same time and place he treated a gunboat in the same manner, with the same results. Some time later two boats were taken from the same squadron to New York, passed quarantine, but though no cases of fever had been aboard for some months, the men engaged in remodeling them, in a New York dock, were infected with the fever. These boats had not been disinfected by the steam process. Other experiments in steam disinfection, which Dr. Bell has since made in person, were cited, and though there have been failures, he attributes them to a lack of thoroughness in the process. Steam heat is preferable to dry heat, because the former can be used with less damage to goods.

The third day of the session was largely occupied with the debate on river transportation. Among other subjects the destruction of the yellow fever germ was considered.

Dr. A. N. Bell expressed himself against some suggestions that had been casually made in one of the speeches of the debate about whitewashing as a prevention against yellow fever. If lime must be used, use it unslaked. In measures against yellow fever dead lime should be done away with, as well as all other dead matter.

This remark turned the debate upon the subject of disinfectants, and several gentlemen expressed a belief that dry steam was the most potent of disinfectants. One speaker remarked that only a temperature of 250° would destroy germs of yellow fever.

Dr. Plunkett, President of the Sanitary Council of the Mississippi Valley, said the idea was general in the Mississippi Valley that the "Plymouth" had been frozen out, and that cold would exterminate germs of yellow fever. It would pacify the public mind if the question of cold as a disinfectant was settled.

Dr. Turner replied that the disinfection of the "Plymouth" was made by breaking up her decks, cleansing and freezing her, but temperature was not noted by medical officers; the lowest recorded temperature was 7° C. Yet a case originated on her in March last, on the starboard side of the vessel, and quite recently a case has occurred in a corresponding quarter of the vessel on the opposite side. It is probable that the water was frozen in the bilges and thawed out by steam.

Dr. Rauch suggested that if the medical officer of a vessel was responsible for her condition, instead of the captain, the fever would be prevented. He thought that it was important that the Board should take some action toward instituting the change.

Dr. Guion, of the United States Navy, said Dr. Rauch was right. The medical officer of a vessel could only make suggestions. The captain is responsible for the sanitary condition of the ship, and even puts men on the sick list.

Dr. Plunkett here insisted on an answer to his question, whether or not the Plymouth had been frozen out?

Dr. Guion replied that she probably had, though he could not answer until an official report has been made.

The next subject of discussion was announced by President Cabell.

2. Railroads—(*a*) Sanitary condition of depots and stations. (*b*) Quarantine stations on railroads, their position and organization; specify for passenger trains, sleeping cars, car construction, freight trains, construction trains. (*c*) Mails. (*d*) Expressage.

Dr. Kedzie offered on this subject the following resolution:—

The depots and stations of railroads and their surroundings shall be kept in a sanitary condition, free from all stagnant water and decomposing organic matter; the local railroad agent or official shall daily inspect the water closets, and shall cause the floor, seats and urinals of such water closets to be kept clean; he shall cause the vaults to be emptied at least every three months, and from the first of May to the first of November he shall cause the privy vaults to be disinfected every week, by pouring into every vault a solution of twenty to fifty pounds of sulphate of iron or sulphate of zinc, or ten to fifteen pounds of chloride of lime.

These resolutions elicited general assent.

The next subject of discussion was announced to be, "System of notification of occurrence of first cases of dangerous diseases, especially of yellow fever. When is it proper to say yellow fever is epidemic in a town?"

Deciding that this question had already been settled by State and local authorities, the Board adjourned to meet in conjunction with the Sanitary Council of Mississippi Valley.

The final session was held on Friday.

Dr. Rauch, Secretary of the Sanitary Council of the Mississippi Valley, requested, before the regular routine of business was entered upon, to be permitted to report to the Board a series of propositions which had been adopted by the Sanitary Council on the preceding evening. The propositions were read and left with the National Board of Health for future consideration. A plan, the arrangement of which had some time ago been referred to a committee, was then adopted, securing coöperation between the National Board of Health, the Sanitary Council of the Mississippi Valley and the American Public Health Association, in collating knowledge of the actual sanitary condition of every city in the United States, particularly in the southwestern States along the Mississippi river. It is designed to ascertain as far as possible everything that will tend to effect the sanitary condition, whether for good or evil, of the various cities, the systems of sewerage, the condition of vaults, and the disposition that is made of refuse matter, and from these data to compile the best sanitary regulations and correct existing abuses. After adopting these measures, the National Board of Health adjourned to meet in Convention at Nashville, on the 8th of November.

From this it is not to be understood that the National Board of Health has literally adjourned

until that date; they will, on the other hand, hold sessions during the entire summer. The stenographic report of the debates, and the proceedings at this, the Atlanta Convention, will be written out, and together with the propositions reported to the Board by the Sanitary Council, will be thoroughly discussed. From these discussions will be ascertained, as far as possible, the best sanitary measures for the prevention as well as the eradication of epidemics; these results, when obtained, will be furnished to local and State sanitary bodies. Then, on the eighth of November, the Board will again meet in Nashville, there to hold a conference similar to the one just held in Atlanta, with leading sanitarians invited from every quarter of the Union. Should the Board obtain an appropriation of six hundred and fifty thousand dollars from Congress, as they desire, they would be enabled themselves to put into effect the results of their deliberations; but with their present means they can only accumulate knowledge, deduce sanitary measures from it, and refer them to local and State authorities to be put into effect.

The Sanitary Council of the Mississippi Valley and the American Health Association then adjourned, to meet in Nashville on the eighth of November.

THE ASSOCIATION OF AMERICAN MEDICAL EDITORS.

This Association met on the evening of May 5th.

The President, Dr. William Brodie, of Detroit, read a full and able paper on American medical journalism.

Resolutions declaring that the advertising of patent medicines be considered a violation of the code of ethics, were approved.

It was proposed to pass an amendment to the constitution, admitting all authors as members, the name of the Association to be changed to correspond with this. Under the rule, this was laid on the table for one year.

Various suggestions were made as to the means of increasing the interest taken in the Association, and to enlarge the scope of its usefulness.

On the election for officers, the following were chosen:—

For President—Dr. Thomas S. Powell, of the *Southern Medical Record.*

Vice president—Dr. Frank Woodbury, of the Boston *Medical Journal.*

The Secretary is a permanent officer. Dr. Frank Davis, of Chicago, fills this office.

After adjournment, the Association was handsomely entertained by Dr. T. S. Powell, editor of the Southern *Medical Record*, at his residence.

The Public Health.

Under date of April 30, Consul-General Heap transmits a copy of a despatch from Dr. Mattiosian, the U. S. Delegate to the International Sanitary Council at Pera, by which it appears that the discussion of the origin, as well as the character, of the plague is still going on, some of the delegates maintaining the disease to be true Asiatic bubonic plague, and others an "inexplicable glandular engorgement;" in consequence of this divergence of opinion, the protocol releasing quarantine restrictions has not yet been signed. The epidemic has almost disappeared in Astrachan. The city of Constantinople is in a healthy condition.

U. S. Marine Hospital Service.

The following gentlemen having passed the examination required by the regulations governing the Marine Hospital service, have been appointed Assistant Surgeons in that service, by the Secretary of the Treasury:—Drs. Charles L. Dana, H. P. Cooke, H. R. Carter, and W. H. Heath.

Assistant Surgeon Charles L. Dana ordered to New York City; Assistant Surgeon W. H. Heath to Washington, D. C.; and Assistant Surgeon H. R. Carter to Boston, Mass., for temporary duty. Assistant Surgeon H. P. Cooke ordered to New Orleans, La.

Items.

—At a recent meeting of the Northwestern Medical Association, of this city, it was resolved that bills should be rendered when services were ended, or at the end of each month, and that the Society endorse a financial agent, who should be employed by the year, on salary, to attend to collection of moneys and keep physicians' accounts when desired.

—The clinic of Dr. Arnold, in the REPORTER of May 10th, was attributed to New York, instead of Baltimore, where it was held.

Personal.

—The Faculty of the Chicago Medical College announce that Professor Edward W. Jenks, M.D., of the Detroit Medical College, has accepted an appointment to the Chair of Medical and Surgical Diseases of Women and Clinical Gynecology.

MARRIAGES.

BRASSARD—TRAINOR.—In St. Johnsbury, Vt., on April 22d, by Rev. J. Boissonnault, Dr. P. H. Brassard and Emma Jane Trainor.

DUNHAM—SLOSSON.—On the 23d ult., in Belford, O., at the residence of the bride's grandmother, by the Rev. Jabez Hall, D. B. Dunham, Jr., late of Chicago, and Miss Cariana Slosson, daughter of Dr. M. H. Slosson.

HEDSTROM—GETTY.—On Wednesday, April 30th, at Jersey City, N. J., by the Rev. James Montgomery, Wilbur F. Hedstrom, M.D., of Cape May City, N. J., and Mrs. Sarah K. Getty, of Philadelphia.

LEWIS—ADAMS.—Near Pleasant Hill, Mo., April 2d, by Rev. John A. McAfee, William E. Lewis, M.D., of White Cloud, Kansas, and Maggie J. Adams.

DEATHS.

GHANDLER.—In Woodstock, Vt., on April 19th, Clayton F., youngest son of Dr. M. H. Ghandler, aged 1 year, 7 months and 19 days.

HOOPES.—In this city, on the 25th, ult., Pascal J. Hoopes, M.D., in his 52d year.

HUTCHISON—At Brooklyn, N. Y., April 29th, Marian Benedict, second daughter of Dr. Jos. C. and S. B. Hutchison, aged 22 years.

SYRUP-GLYCEROLE
OF
FERROUS CHLORIDE.

The Combination which all Forms of Iron must assume before Assimilation.

Superior to all other Iron Salts in that, while it is readily taken into the circulation, and does referruginate the blood, it does not ordinarily cause constipation nor headache. It is very pleasant to the taste, and is unalterable.

Ferrous Chloride is a neutral salt, consequently it has no action upon the teeth, and may be administered fearlessly. This fact and the delightful taste of my preparation render it an advantageous form for administration to children. Each fluid drachm contains one grain of Ferrous Chloride, which, owing to the certainty of its assimilation, is a full, active, adult dose.

HINTS IN THE OBSTETRIC PROCEDURE.

BY

WILLIAM B. ATKINSON, A.M., M.D.,

Lecturer on Diseases of Children, at the Jefferson Medical College; Physician to the Department of Obstetrics and Diseases of Women, Howard Hospital, Philad'a.

SECOND EDITION. ENTIRELY RE-WRITTEN AND ENLARGED. 12MO, CLOTH. PRICE, $1.00.

—o—

The very gratifying reception given this handbook of the essentials of the obstetrical art has led the author to submit it to a careful revision, and increase its size by adding a number of new topics.

It may safely be characterized as the most convenient, compact, reliable and handy *vade mecum* on obstetrics in the language; as the following personal and editorial statements sufficiently attest.

OPINIONS OF PHYSICIANS AND THE PRESS.

"It is really a '*multum in parvo*,' and will, I am sure, be of great service to multitudes in the profession who have hitherto followed the routine of old traditions."—*Prof. Fordyce Barker.*

"It is as good for the old as for the young practitioner."—*Dr. J. Marion Sims.*

"It abounds in extremely valuable hints, and is calculated to do much good."—*Prof. Goodell.*

"Founded upon the personal experience of the author, it must prove of value to the very wide circle of the profession who will be led to purchase it by their acquaintance with the author and his reputation."—(Philadelphia) *Medical Times.*

A SUCCESSFUL CASE OF OVARIOTOMY.

BY A. R. SMART, M.D.,
Of Hudson, Mich.

Ovariotomy is now so frequently practiced, that it seems useless and unnecessary to report instances of its performance. Still there are some questions connected with the operation which are yet open and unsettled. Among these is the best method of dealing with the pedicle. It is with the view of adding to the testimony in favor of the plan pursued in the following case, that it is reported.

Mrs. J. D. B. presented herself for examination, January 31st, 1879. Is twenty-seven years of age; has always been healthy prior to the development of present disease. Has two children, one four years and the other eighteen months old. Has been married seven years. During the last pregnancy she noticed unusual abdominal distention. Before this had discovered nothing unusual. At the time of confinement, after the birth of the child, the abdomen remaining large, the attending physician supposed for some time that another child was yet to be delivered. From this time the growth steadily increased, until, at the present examination, she is fully as large as a woman at full term. Her general health is good. No pain is complained of, except at intervals, in the right iliac region. Diagnosis, a unilocular cyst of right ovary, with few, if any, adhesions. On the third day succeeding the examination I removed, by tapping, thirteen quarts of a dark chocolate-colored fluid, strongly albuminous, and of the consistence of thin syrup. The cyst rapidly refilled, and on March 6th, a few days over four weeks from date of tapping, was nearly as full as when first seen. On this day, having thoroughly cleansed out the bowels by castor oil thirty-six hours previous to operation, at eleven A.M., assisted by Drs. W. N. Smart, E. Eaton, Wm. Town, Lorenzo Town, J. S. Power, and Jos. Welch, I proceeded to the removal of the cyst by abdominal section. The incision was about five inches long, extending from the pubes upward. The cyst was reached with no difficulty, and with very trifling hemorrhage. After tapping with a Wells' trocar, first having ascertained freedom from adhesions, the cyst was slowly withdrawn. Some difficulty was here experienced from the tendency of the omentum and intestines to roll out of the wound, and from the solid portion of the cyst, which was rather large to pass through the opening made. The cyst was found to be unilocular, with a solid portion occupying the site of the degenerated ovary. The pedicle was thin, broad and short, and composed of the broad ligament. This was split in halves by passing a needle, armed with a stout, double silk ligature, and each half ligated, the ligatures being cut short, and the pedicle severed at one-half inch outside the ligatures. The other ovary was found healthy. No hemorrhage having occurred, the pedicle was returned, and the abdominal wound closed with six deep sutures (silk) passed through the peritoneum. The wound was dressed with broad bands of adhesive plaster passing round the body, the abdomen being then covered with a layer of cotton wool, and over all a firm flannel bandage. Time of operation thirty minutes. Patient removed to bed in good condi-

tion. Visited patient three hours later. Had recovered from anæsthetic; no nausea; slight abdominal pain; expressed herself as feeling very comfortable. One-fourth of a grain of morphia had been injected into the arm at the completion of dressing. Ordered one-fourth of a grain of morphia with bismuth if pain was complained of. To have iced milk in small quantities. Urine to be drawn off with catheter every six hours. The subsequent progress of the case was all that could be desired. The wound was undisturbed for three days. One-half of the stitches were removed on the fourth day, and the remainder on the eighth day. The bowels were kept confined for ten days, and then evacuated by enema. The catheter was used for ten days. No disturbance of the stomach was noticed. The pulse never rose above a hundred per minute, but once on the fourth day, and then but a few hours; the temperature once reached one hundred and three, but for the first week ranged from one hundred to one hundred and two, going down to natural during the second week. On the fourteenth day she began to sit up, and on the twenty-first day she walked three-fourths of a mile, and up a flight of stairs, with no pain or inconvenience. At present writing, April 21st, patient declares herself as well and able to endure as much fatigue as ever in her life.

TREATMENT OF STRICTURE AND GLEET WITH GALVANISM—REPORT OF TWO CASES.

BY O. E. HERRICK, M.D.,
Of Greenville, Mich.

The use of galvanism in the treatment of uterine diseases (the application of which was described in the REPORTER, vol. xxxix, p. 175) suggested to my mind that it might be equally efficacious in treating diseases of the male urethra. I well know that galvanism as heretofore tried is a very old remedy in the treatment of stricture; and the manner of its application is all the novelty I claim for it. The treatment of stricture with galvanism has always been with a battery, and could only be tried by sittings of from a few moments to an hour, at the longest. The method which I pursued was similar to that described by me for the relief of ulceration of the os uteri and vaginal leucorrhœa, to which I have above referred. The apparatus is a copper wire attached to a silver catheter or bougie at one end, and to a zinc plate at the other, which is held in contact with the body by a bandage, and an acidulated sponge placed upon the zinc plate produces a current sufficiently strong for the purpose. I have found that my patients are enabled to wear this appliance twelve hours out of the twenty-four, six hours during the day and six at night, thus keeping the tissues composing the stricture under the influence of galvanism for a much longer time than is possible with a battery; and therein is the advantage of this method.

CASE 1.—Mr. P., aged about 50 years, had contracted his first gonorrhœa about twenty years ago, which was followed by stricture; about that time he submitted to an operation of some kind, which he says relieved it, until he contracted a second gonorrhœa, when he was again troubled with the stricture, but did not submit to another operation, and the stricture has troubled him at intervals ever since. He had learned to introduce the catheter himself, and got along without serious trouble until about six months ago, when it became so bad that he could no longer introduce the catheter himself; he then called a physician, and he failed, and in turn called another, for counsel; they then concluded to administer chloroform, which they did; and after operating for two hours and failing to pass the instrument, they left the case for the day, but returned the next, and after again chloroforming the patient, succeeded in making a *false passage*, but did not get the catheter into the bladder. They then desisted, and again left the patient to himself, who during the night succeeded in emptying the bladder, probably from the relaxing influence of the chloroform. He continued to have more or less trouble in voiding his urine for a couple of months, when I was called in. I found him in great pain and discharging large quantities of pus from the false passage, with the stricture as bad as ever. I attempted to pass a No. 6 catheter, but the parts were so tender that I desisted and applied the apparatus described above, putting it on about 4 o'clock P.M.; he wore it until 12 o'clock, when I again saw him; the pain had almost entirely subsided, and when I removed the catheter (which had only been introduced as far as the stricture) he was able to pass his urine with little trouble. I left it out until morning, when I again applied it and left it until 2 o'clock in the afternoon, at which time I again saw him; he had suffered no pain, and the discharge had almost ceased. At this time I found no trouble in passing the catheter on through the stricture into the bladder. This treatment was followed up for five days, when I discharged my patient; and he has had neither stricture nor discharge since; he con-

tinues to occasionally wear the instrument for a few hours, once or twice a week, but declares himself well.

Case 2.—Mr. V., aged forty, contracted gonorrhœa about fifteen years ago; has suffered from stricture at intervals ever since. This patient, like the preceding one, had also learned to introduce the catheter himself, and had got along without serious trouble until about four months ago, when, after taking a long and cold ride, he found that upon getting out of his cutter he could not void his urine. He attempted to pass the catheter as usual, but after repeated efforts failed to do so. He then fomented the parts with applications of warm hops during the night, and again attempted to pass the catheter, but failed. After working at it at intervals during the day without success, I was sent for in the evening. Found the patient suffering considerable pain and just recovering from a fever chill. The urethra was swollen and tender, so much so that I, after a slight effort, abandoned the attempt to pass the catheter through the stricture, and, as in the first case, applied the galvanic attachment. This was about seven o'clock in the evening; at twelve o'clock I again called, and after a slight effort succeeded in passing the catheter into the bladder, and left it there, with the wires attached, until morning. At eight o'clock, when I called, I found that the inflammatory action had almost entirely subsided, and that the catheter was perfectly loose in the urethra. From that time until this the patient has had no further trouble with his stricture, although he wore the apparatus for about ten days longer. I have treated quite a number of cases of gleet of long standing by this method, with equally good results, taking from five to ten days to effect a cure.

A CASE OF PUERPERAL CONVULSIONS.

BY N. B. KENNEDY, M.D.,
Of Hillsboro, Texas.

I was called in great haste, four miles in the country, on the morning of the 22d March last, to see Mrs. Carroll. On reaching her home I learned she had had seven convulsions. The patient, a primipara, 17 years of age, short neck and very fat, had always been healthy, and was now in the very bloom of youth and beauty. I was informed that she was at the end of her term. An intelligent old lady present stated she had not detected any labor pains. An examination *per vaginam* revealed a rigid and undilated os uteri, and almost out of reach of the finger. She lay in a semi-comatose condition, pupils dilated, pulse 65 per minute, hard and cordy. Bowels and bladder had both acted; mind very much confused; did not recognize her husband and attendants; could not answer questions at all.

I informed her husband that she was in a very critical condition, and asked that Dr. J. S. Scofield be sent for. In the meantime I opened the median basilic vein of both arms, but obtained only a few ounces of blood. Gave her chloral hydrate, chloroform and morphia hypodermically, in large doses, without any effect whatever, the convulsions coming on at regular intervals, and with increasing violence. On the arrival of Dr. Scofield we decided to sever the temporal artery, which we did, on the right side, and took away about a quart of arterial blood, which failed to produce any impression upon the convulsions. A vaginal examination now being had, we found the os soft and dilated to two inches in diameter, and that feeble pains had set up. From the flaccid condition of the head, and no pulsation in the brain, we decided that the child was dead. We now continued the fluid extract of ergot, in drachm doses, with the hope of increasing the pains, and also severed the left temporal artery, and obtained about two quarts of blood. After this the convulsions ceased, the breathing became more tranquil; the face less suffused; pulse 60, and more compressible; mind still confused; pupils dilated; she took nourishment readily. We decided to give her a night's rest and remove the child next morning. A half grain of morphia was administered in some toddy, and she slept soundly and sweetly until morning, when she was awakened by another convulsion.

We at once put her under chloroform and proceeded to remove the child. With much labor we succeeded in puncturing the brain through the fontanel, evacuated the cerebral substance, and then with the forceps removed the frontal and parietal bones. Steady traction soon delivered the remaining portion of the head, followed by the body. The child had the appearance of having been dead some time. After waiting twenty minutes, I introduced my hand to remove the placenta, and found an hour-glass contraction of the uterus, but with very little trouble removed the placenta. I then applied cold cloths to the pelvic region, and found the uterus to contract into a hard, firm ball. Patient reacted finely from the chloroform and took nourishment readily. We gave her whisky and carbonate of ammonia, and had begun to congratulate ourselves on a successful termination of

the case, when suddenly another frightful convulsion came on, from which the patient never reacted. She became profoundly comatose, pupils largely dilated, the circulation very much depressed, the extremities cold, but the uterus remaining firmly contracted all the time. For four or five hours we applied restoratives and gave stimulants by the mouth, by the rectum and hypodermically, but all to no purpose, the compression on the brain becoming more and more pronounced, caused, in our opinion, by the giving away of one of the meningeal arteries. Finally death closed the scene, and her young husband was left desolate.

It is much to be regretted that an autopsy could not be had. If the public mind could be educated to the all important necessity of *post-mortem* examinations, science would make more rapid strides forward.

While I must admit that blood letting pushed *ad deliquium* is our best remedy in this fearful malady, yet I must say it is not the *sine qua non*, a great many physicians would have us believe.

Hospital Reports.

COLLEGE OF PHYSICIANS AND SURGEONS, NEW YORK.

CLINIC OF PROF. T. GAILLARD THOMAS, M.D.

REPORTED BY P. BRYNBERG PORTER, M.D.

Case 1.—Chronic Ovaritis—Prolapse of Left Ovary, with Retroversion and Dysmenorrhœa.

Gentlemen:—The first patient to whose case I ask your attention to-day is Catherine H., a native of the United States, twenty-four years of age, and unmarried. It will not take us long to get her history, as it is a brief, but very significant one.

How long have you been sick? "One year." What happened at that time? Did you meet with any accident? "No." What troubled you, then? "Severe pain." And this has continued ever since? "Yes." Where is it located? "In my left side, low down." (The patient placed her hand on the left iliac fossa.) Has it always been confined to this one region? "Yes." What else have you complained of? "Nothing, except some trouble about the throat." Did that come on about the same time? "A little before the other trouble." (I may here explain that what she speaks of seems to be some laryngeal difficulty, about the exact nature of which we need not concern ourselves at present.) Are you never free from this pain in the left side? "No." Is the pain increased at all at the time of your monthly sickness? "Yes." But is it still confined to the same spot? "Yes." Do you have any backache? "Sometimes." Do you have the whites? "Yes, quite badly." Are you able to stand and walk with ease? "No, if I stand or walk for any length of time, it gives me great pain." Where is this situated? "Down the thighs." Do you have any difficulty about passing your water? "No."

Here, you perceive, is a very straightforward history. This young woman was perfectly well up to a year ago, with the exception of some laryngeal trouble, which commenced a short time before; but at that time, without any apparent cause, a very severe pain in the left iliac fossa came on suddenly, and has never left her since. As you have heard her relate, this pain is considerably aggravated at the time of her menstrual periods; and on inquiring a little more particularly in regard to this point, I find that it begins to grow worse three or four days before the flow commences, that it is most severe of all during the flow, and that after the latter ceases, it once more diminishes to the ordinary degree of acuteness which she habitually suffers all through the inter-menstrual period.

Now, our design is to find out, if possible, the cause of the symptoms of which she complains, viz: fixed pain in the left iliac fossa, pain at times extending down the thighs, and leucorrhœa. Accordingly, I proposed a physical examination, and the first thing that I detected that was abnormal, after introducing my finger into the vagina, was a hard ridge extending backward from the cervix. Conjoined manipulation showed this to be the body of the uterus, the organ being in the second degree of retroversion; and it then occurred to me that the latter (retroversion) might be the true diagnosis of the case. Why? Because the symptoms present might thus be explained. The pain in the iliac fossa, might be due to the dragging of the displaced uterus upon the broad ligament, and the pain extending down the thighs to its pressure upon the sacral nerves, while the passive congestion resulting from the retroversion would explain the leucorrhœa complained of.

But on continuing my exploration of the pelvic organs, I discovered something else. Upon the left side of the uterus there was a mass of considerable size, which was tender on pressure, and the moment that I touched it with my finger the patient exclaimed, "that is the pain I have."

I could, however, readily push it up out of the way; practicing a kind of *ballottement* upon it. On the right side I was not able to make out the ovary at all; nor could I discover anything abnormal there. Finally, I placed the patient on her side, and introduced the uterine sound, in order to make complete the demonstration of retroversion.

Now, what was the diagnosis? Certainly not the same as was at first suggested. To begin at the most important element in it: "Congestion, enlargement, sensitiveness, and prolapsus of the left ovary." Is that the cause of all the trouble? I think so. Then, of course, that is the diagnosis. If it is not the cause of the trouble, then we have made "an error of diagnosis," and retroversion of the uterus will probably be found to be the correct diagnosis. But I take it for granted that the symptoms noted here depend on the condition of the ovary, because in determining affections of internal organs, such as it, we often have to depend on a process of exclusion. What, for instance, might this sensitive mass

by the side of the uterus be if it were not the ovary? A fibroid at once suggests itself. But it is too soft, and also too movable, for a fibroid, unless the latter had a long pedicle. It is a well ascertained fact, however, that fibroids with long pedicles are, as a rule, by no means sensitive. But suppose, in spite of all the evidence to the contrary, it were a fibroid with a long pedicle. Many instances are on record of uterine fibroids, with such long pedicles that they have been enabled to rise entirely out of the pelvis, to float in the abdominal cavity, and sometimes to attach themselves, by adhesive inflammatory action, to the liver, spleen, and other distant organs. But if a fibroid of this character, why should it be so sensitive, and give rise to so much pain, and why should this pain always begin to increase three or four days before the menstrual flow, and remain aggravated until the flow ceased? These are questions which cannot be answered satisfactorily. On the other hand, it cannot be a phlegmon, resulting from inflammatory trouble in the pelvis, because it is so movable; such masses of lymph always remaining perfectly fixed.

We conclude, therefore, that this is a case of what is called chronic ovaritis, and no other diagnosis will so satisfactorily explain the symptoms of the patient. When such ovaries are taken out and examined, it is sometimes found that the organ has undergone cystic degeneration; its whole mass having been converted into numerous small cysts, which do not seem ever to have shown any tendency to increase in size. More frequently, however, there is found simply an enlargement of the organ, due to congestion, or perhaps hyperplasia as well.

We come next to inquire what is the cause of the leucorrhœa, and what of the retroversion? It is a fact, which my experience amply attests, that we hardly ever find a case of this kind without a pretty well marked leucorrhœa, and we have Dr. Barnes' authority for saying that a displacement of the uterus, of greater or less degree, invariably exists in connection with such a condition of the ovary. Both are explained by the constant state of congestion in which the uterus is kept by reason of the diseased ovary; the displacement, which may be either forward or backward, being due to the increased weight of the organ causing it to depart from its normal position, and the increased supply of blood to the lining mucous membrane of the uterus giving rise to the leucorrhœa.

The prognosis in this case is by no means good. If you promise such a patient too much she will be sure to become discouraged, and to cast reflections upon you; and if you promise too little, she will not think it worth while to place herself under treatment at all; while she can really be benefited very considerably, if a judicious course is pursued in her case. How, then, are we to treat this condition of the ovary? In the same general way that you would proceed with a neuralgia existing without any assignable cause. In the first place, we should endeavor to improve the condition of the blood, and to build up the general health, which is usually considerably impaired under these circumstances. But something more must be done, for local treatment is unquestionably demanded. Unfortunately, the means at our disposal are not as efficient as could be desired; but, meagre as they are, they should be given a faithful trial.

For three or four days before the menstrual flow commences, as well as during the continuance of the same, this young woman should remain warmly covered up in bed. The bromides often seem to have a beneficial and soothing effect in such cases; and of these I prefer the bromide of ammonium, which may be given freely, with impunity, as much as fifteen or twenty grains at a dose. When she gets up, it would be well for her to wear an elastic pessary, for the purpose of keeping the prolapsed ovary up in position as well as possible; and twice a week, for twenty minutes at a time, the constant current from a battery should be made to pass through the diseased ovary, by placing one electrode immediately over it and the other against the spine. In addition, she should employ very copious and very frequent vaginal injections of warm water, for its soothing effect; and finally, a gentle counter-irritation might be kept up by means of compound tincture of iodine, painted over the region of the ovary.

The result will not be encouraging; but these are the best measures for the relief of such a case as this with which I am acquainted. I would not expect to cure the patient in the course of a year; but I think by the end of a year of treatment she would, in all probability, be greatly improved. Very often you will find that patients who suffer in the way that this young woman does have been subjected to cutting operations about the uterus, under the idea that the cervix was at fault; but, of course, all such procedures are futile under the circumstances, and I shall have something more to say in regard to their inappropriateness in connection with the next case. You observe that I have advised quite a number of measures for the relief of the patient; no less than five altogether, in addition to building up her general health and enjoining perfect rest before and during menstruation, viz: warm vaginal injections, the wearing of a pessary, bromide of ammonium, galvanism and counter-irritation. This is because they are all so comparatively inefficient; but any one of them is less valuable than all combined.

I regret to say that the next patient whom I had hoped to show you cannot be persuaded to come before the class. Her case, however, is identical with the one which you have just seen, with this exception, that the cervix uteri has been widely slit open, no doubt for the purpose of relieving the dysmenorrhœa present. It did not do any good, for the reason that incision of the cervix is not a good way of treating chronic ovaritis, which is the real difficulty here, as in the preceding case. The operation was simply a blunder on the part of the surgeon performing it; and yet it is so often done in these cases that I feel called upon to specially warn you against it. Such a mode of procedure, under the circumstances here present, is not only useless, but absurd, and only tends to bring a very good operation, in its proper place, into disrepute. Of course, the idea with which it is performed is to enlarge the cervical canal, so that the

menstrual blood may have free egress; but if a surgeon who contemplated the operation in such a case would take the trouble to make a vaginal examination, he would at once see that the flow of blood was not impeded in the least by any stenosis; as could also be proved by the introduction of the uterine sound. You see, therefore, how irrational the operation is. As well might a plumber, for the purpose of allowing a free escape of water, cut through the walls of a pipe when there was no obstruction of its calibre whatever. The operation, as I trust you now all perceive, can do no possible good unless we have positive evidence there is a stricture somewhere about the cervix.

In the second case of ovaritis the pain is not so circumscribed as in the first, but is spread over a considerable region of the pelvis. This, I think, must be due to a peculiarly hyperæsthetic condition of the nerves of the part, as there is no evidence of pelvic inflammation, in the shape of hard masses of lymph, such as we would have been likely to meet with had the latter occurred.

Case 2.—Sarcoma of the Uterus.

In the next case, as in the first, there is only one symptom of importance, although it is of an altogether different character. The patient's name is Caroline L., and she is a native of the United States. She is thirty-two years old, has been married twelve years, and is sterile. She says that she was in perfect health up to six months ago, when she was taken with a free uterine hemorrhage, not exactly at, but near, the regular time for the menstrual flow. This metrorrhagia has continued up to the present, with the exception of an intermission of a day or two at a time occasionally, but she has never suffered from pain until within the last two weeks. Her general health seems to have remained pretty good; although she suffers considerably from weakness and shortness of breath in going up stairs. The reason of this you can easily see by looking at her face (even if you had not heard the history), viz: loss of blood. As to the amount of the long continued hemorrhage, it is impossible to speak with any accuracy; we can only judge, from her present anæmic condition, that it has been excessive. The patient herself, on being interrogated in regard to this point, at first stated that she thought she must lose a gallon of blood a day; but afterward reduced her estimate to half a gallon a day. Of course, this is preposterous; but you can scarcely trust anybody whatever (not even the most careful physicians) to give a correct account of the quantity of blood lost in any given case, where hemorrhage occurs, as it is one of the most difficult things in the world to estimate. Here the patient is much more likely to have lost two ounces instead of two quarts, a day; but even that daily amount would, as you can see, be something enormous during the course of six months. At all events, the hemorrhage has been so free and so continuous, that she is entirely unable to tell when the menstrual period occurs. The whole history, then, is one simply of excessive loss of blood.

On resorting to an examination, I found, in the first place, that the cervix was greatly hypertrophied, and that its whole surface was very rough to the feel; as though it were covered with little eminences. Then, employing conjoined manipulation, I ascertained that the body of the uterus was also very much larger than normal, and that, in addition, it was bent forward to a considerable extent. When I examined the cervix by means of the speculum, its whole surface was very red, and presented the appearance of granular degeneration, with excessive enlargement. (The patient was now dismissed from the room.)

From the history which has been given, and the condition of affairs found by physical exploration, I feel as positive as I possibly can about anything, that the disease from which this woman is suffering will prove fatal. It is fully five years since we have had a similar case at the clinic, and I have never seen but two others during the whole course of my experience; but the disease is unmistakable when one is once familiar with its characteristics. Why, you may ask, do I call it malignant? But what, I may inquire in return, but malignant disease could cause the condition of affairs and give rise to the symptoms which we meet with here? In every case we must take both the rational and physical signs into consideration. There are several points that occur in connection with this one which it is necessary to dispose of before we can accept positively the diagnosis which, I think, is the only tenable one in this instance.

In the first place, could not the marked enlargement of the uterus be due to subinvolution? Undoubtedly, if the patient had ever been pregnant; but she is a woman of a much better class and much more intelligent than most of those which we meet here, and she is entirely positive that she has never either given birth to a child or had a miscarriage.

Again, there is no sign of fibroid here; for if there were a fibroid in the body of the uterus, there is no reason why the cervix should also be thus enormously enlarged.

Then, in proof of malignant disease, we have the extensive denudation upon the surface of the cervix. In addition, she is now beginning to suffer severe pain, and is growing weaker all the time, from excessive loss of blood, as indicated by the bellows murmur which is heard at the base of the heart, and is due to the watery condition of the blood. I think, therefore, that we cannot come to any other conclusion than that we have a malignant condition to deal with here.

But while nothing but malignant disease could have produced such a condition of the cervix as this, it by no means presents the characteristics (nor is the history of the case that) of cancer. It is an instance of a much rarer form of malignant disease, sarcoma of the uterus.

Sarcoma sometimes attacks the vagina instead of the uterus, and I once had a child, eighteen months old, under my charge, upon one of whose labia majora there was a sarcomatous tumor as large as a hen's egg. This was removed by means of the galvano-cautery; but in six months afterward the mother brought the child back to me with the growth the same size as before. It was again removed, and again returned; but I declined to operate again, as by this time some of the secondary tissue had become involved. It was once more as large as a hen's egg; and in two or three months after-

ward the patient died. The microscope showed that the tumor was a large-celled sarcoma; although this diagnosis had been made from its gross appearance before it was removed the first time. In this case the disease probably commenced in the body of the uterus, and the cervix became affected afterward.

Now, such being the diagnosis, what can we do for this patient? Almost nothing at all—even less than if it were a case of cancer. At first I thought of amputating the cervix, in order to control the hemorrhage more completely; but now, on maturer deliberation, I hesitate to adopt such a procedure, because the body of the uterus is also undoubtedly implicated in the disease. By so doing, we would expose the patient to the dangers of a capital operation, and yet still leave a large portion of diseased tissue entirely untouched. This question of operation is the only one of much importance in connection with the treatment; and on the whole, it now seems to me unadvisable. If it is not performed, a speculum should be introduced, and either chromic or chemically pure nitric acid applied thoroughly to the whole surface of the cervix. This would have the effect of destroying the superficial vessels, and thus checking hemorrhage; and the application should be repeated whenever the hemorrhage returned. Some prefer strong sulphuric acid; but I do not think it as useful as either of those mentioned. But, whatever method of treatment is adopted, the case is entirely hopeless.

Case 3.—Vesico-vaginal Fistula.

Our last patient to-day is Johanna O'D., a native of Ireland, and forty years of age. She has been married eighteen years, and has had nine children, but no miscarriages. Her last child was born four months ago.

Were all your children born at full term, Mrs. O'D.? "Yes." Did you ever have any trouble at the time of their births? "Yes. I have always had a very hard time of it when my children were born." How long do your labors usually last? "Always three days and three nights." Has the doctor ever had to use instruments in order to deliver you? "Yes; twice." Is the child that you had four months ago living? "No; it was stillborn." Now, how long have you been complaining? "For four months." (That is, as you will notice, ever since her last labor.) What has been the trouble? "My water keeps passing away from me all the time." How soon after labor did this trouble commence? "Two days after." Then for two days you passed your water naturally? "No. I did not pass any water at all for two days; and then it commenced to come away from me as it does now."

Now, here is a woman who has always enjoyed good health up to four months ago, except that she has had considerable difficulty in childbirth. This is probably due to some narrowing of the pelvis, as she says she always remains three days and three nights in labor. Ever since her last confinement, four months ago, she has suffered from an involuntary escape of urine.

On making a physical examination, we find that the lower part of the abdomen, the nates, the vulva, and a large portion of the inner surface of the thighs, are all denuded of epithelium, and that immediately anterior to the cervix uteri there is a solution of continuity in the roof of the vagina, through which the finger can pass directly into the bladder. A person not accustomed to making physical explorations in such cases, however, might possibly not have entered the bladder, as he would have found what is apparently a little soft polypus just at the spot mentioned. But this polypus is nothing more than a portion of the anterior wall of the bladder which has actually prolapsed through the opening in the posterior wall. Of course, if the bladder was full, such a condition of affairs would be impossible; but as, on account of the leakage here, this patient's bladder never is full, we have such a prolapsus occurring. It is not uncommon, when the fistula is large, to have the anterior wall protruding to such an extent that it looks like a tomato, through the speculum. It is undoubtedly an inexcusable blunder to remove a portion of the prolapsed bladder, under the impression that it is a polypus; and yet this has actually been done more than once.

Of course, the diagnosis is plain enough here. The case, however, is a somewhat more serious one, on account of the vesico-vaginal fistula being so close to the cervix uteri, than if it were at some little distance from it, since in any operation that is undertaken for its repair it will be necessary to pare a portion of the uterus itself. If there was any space between the fistula and the cervix, it would be a perfectly simple case.

Now, in regard to the etiology of this lesion, was it the forceps that did the mischief? On the contrary, I will venture to say that it was the absence of the forceps. It is exceedingly rare for this instrument to give rise to vesico-vaginal fistula, and even the operation of ovariotomy very seldom causes it. When this is the case, the fistula heals up immediately, without the slightest difficulty. When such a fistula results from scarlatina, however, it never closes without operative interference; and that is the case with the kind of fistula which is present here. Let me show you, by way of an illustration, how these fistulæ occur. There is a patient, for instance, with a broken thigh, who is obliged to lie on his back for a long time continuously, on a hard bed. After a while there is interference with the circulation at the point of greatest pressure, and a local death takes place there, in consequence. Presently, a piece of tissue sloughs off from the part, and then there is a bed-sore to annoy the negligent surgeon. In a critical case a large bed-sore will sometimes decide its issue against the patient. Now, what we may call a bed-sore occurs in the same way in the wall of the bladder, in certain cases of parturition, on account of the long-continued compression of the tissues between the bones of the pelvis and the child's head. The pressure under these circumstances is enormous, and in this case, as you have heard, it was kept up for three days and three nights. Consequently there was a slough formed, which came away in two days after the termination of the labor, and left the fistula which is still giving the patient so much annoyance. Of course, the urine should have been

drawn by means of the catheter, but the fact that the catheter was not employed, although there was retention for two days, did not, I think, have anything to do with the causation of the fistula. The period of time after parturition at which the sloughs come away in cases of this kind varies very greatly, and there is one well-authenticated instance on record in which this did not take place for thirty days. Fortunately, the prognosis is always a favorable one; although in the present case, as has been remarked, the operation will be more difficult than usual, on account of the proximity of the fistula to the cervix.

AMERICAN MEDICAL ASSOCIATION.

THIRTIETH ANNUAL MEETING.

SECOND DAY.

The Association reconvened at 9.30 A. M., and was called to order by Vice President Murphy. There was a full attendance, in spite of the rain. Communications from the Committee on Arrangements were in order, and several announcements were made.

A communication against the abolition of the duty on quinine created some sensation. There were cries of no! no!

The communication was tabled, and on motion of Dr. Roberts, of Nashville, the Association reiterated its request that Congress remove the duty from quinine. There were some nays, but the ayes had it. The next business was the address of Dr. Thomas F. Rochester, of Buffalo, N. Y., chairman of the Section on the Practice of Medicine. Dr. Atkinson, of Philadelphia, moved that the address just read be referred to the Section on Practice of Medicine.

An amendment, that portions of the paper referring to typhoid and yellow fevers be referred to the Section on State Medicine, was lost.

The original motion was adopted.

An address by Dr. John S. Billings, of Washington, was next in order, but President Parvin stated, with regret, that Dr. Billings was too unwell to read his own paper, but that it would be presented by Dr. J. J. Woodward, of the United States Army. The paper was on state medicine. It was a masterly treatment of a subject whose importance is just beginning to loom before the public. It explained fully the philosophy of the National Board of Health, and as it came from one of its leading members, was heard with great interest. The necessity for a national quarantine, and its advantages, were fully expounded.

The paper was referred to the Section on State Medicine, and a copy asked for publication.

Dr. N. S. Davis, of Chicago, made a report from a special committee on questions discussed by President T. G. Richardson, in his annual address of last year, which was received. They favored the amendments proposed for the present rules on prize essays. They recommended the expunging from section 3 all relating to prize essays, and to insert a clause declaring that there shall be four prizes of $250 for the best original contributions to medical knowledge. The chairmen of the Sections on Practice of Medicine, on Obstetrics, on Surgery and Anatomy, and on State Medicine, shall take charge of the competition and arrange its methods. The report was to lie over for action until next year, under the rule.

It was received, and the committee discharged.

The next business was the consideration of proposed plans of change in the plan of organization. The first was an amendment declaring that the Committee on Nominations should hereafter select the nominees only from those members of the Association present.

A motion to table this amendment was made.

The President stated that only delegates were voters. Permanent members and visiting members are not voters. A rising vote was called for. The yeas on the motion to table were 120, and the nays 5.

Dr. H. O. Hitchcock offered an amendment prescribing the method in which the choice of officers should be made, and enlarging the scope of nominating powers of the committee.

Dr. Reynolds, of Louisville, said the amendment implied an imputation on the fairness of the previous methods of the Association, and it was tabled.

An amendment by Dr. Caldwell, of Maryland, to create a new section, was tabled. An amendment offered by Dr. Maddox, to create a new section, on genital and urinary organs, was read. A motion to table it was made and a rising vote on it asked. The yeas were 73 and the nays 78. Applause. The amendment then came up for discussion. Dr. Davis said there was danger of making many sections which would not attract enough attention to make them interesting. But two sections had been consolidated yesterday, and he favored the trial of the new section proposed. If it did not work well it could easily be discontinued. He did not like the practice of some men, going about from section to section, trying to imbibe all without imparting anything.

Dr. Brown, of Texas, said the sections had too many long papers, and were not made as interesting or as useful as they might be.

It was moved that the amendment be referred to the Section on Surgery, with request that it report to the Association to-day. Agreed to.

Dr. N. S. Davis, of Chicago, offered an amendment to the code of ethics, declaring it to be against the ethics of the profession for any physician to teach or encourage any student of an irregular or exclusive system of medicine.

Dr. E. S. Dunster, of Ann Arbor, spoke in opposition to the amendment. He said he had no personal motive in opposing it, or any desire to shelter himself from the responsibility of any past teaching. He said he wished to remain in the Association, but not even membership would be a fitting price for the abandonment of scientific convictions. He feared the amendment would bring dishonor and disaster on the profession. The code says medicine is a liberal profession, but this amendment makes it close and exclusive. The whole spirit of the amendment is opposed to the broad principles of true science. He attacked the amendment on various grounds. Said it was impossible to enforce such a statute. It would be a dead-letter law, a reproach to the wisdom of the body that enacted it. A thorough enforcement of this law would close every clinic in the land. In nearly every

clinic, in large cities, are found homœopathic students. He said in the leading homœopathic colleges text books by leading allopaths are freely used. This is teaching the students of an "irregular" system, as it is called, and you can't help it. Legally, the amendment will be futile. If the student of an irregular system, as it is called, were to apply to a State school and be refused, he could obtain a mandamus in any State of this Union to give him an entrance and provide him tuition. What is the use of setting up limitations which cannot be carried out? He argued also on the merits of the question. It is based on an assumption of a most fallacious character. It assumes that the teaching of the students of irregular systems will tend to build up these systems. This is folly. It declares that the teachings of science lead to error—a proposition which no man in his senses will give his endorsement. Such a principle carried out would prevent a minister of Christ from preaching the gospel when there were atheists or sinners in his congregation. History has to-night nothing plainer than that truth is the antidote, and finally the victor, of error. The argument was not only masterly in its logic, but was marked throughout by a liberality of view, which is the honor of a true scientific man. Said he: "If national medicine cannot triumph in such a contest, she deserves to fall and be buried in dishonor." [Applause.] The address caused a sensation in the Association.

Dr. Dudley Reynolds moved to lay the amendment on the table; he said it had been killed.

A member appealed for free discussion on both sides. A voice: "The gentleman who moved to table the motion only a moment ago was for free discussion." [Laughter.] The motion to table was withdrawn.

Dr. Davis said he did not wish to discuss the matter, but he would state the reasons which led to the report which proposed the amendment. The Association had taken the steps which made the amendment a necessary result of its action. The judicial council, as a committee, was ordered to report just such a clause. The amendment was the best that could be done. It did not follow that the committee favored the amendment. He said it would be repugnant to him to teach students of an irregular college, who merely came in to catch what they could of his teaching. He admitted that there was a line beyond which the code of ethics could not be carried, without coming in contact with State and municipal laws.

Doctor Pratt said the argument against the amendment was specious. It was the argument of those who wanted to make money by teaching irregular pupils, and be considered ethical, while practitioners are considered non-ethical if they associate with such pupils after they become practitioners. He moved that the proposed amendment lie on the table until next year.

Dr. Brodie, of Detroit, moved to lay that motion on the table. The vote was taken by rising. The yeas were 72 and the nays 122; so Dr. Brodie's motion was lost. The announcement was received with applause. The motion to table till next year was carried.

The roll of States was called, for the purpose of allowing delegations to choose places where they would meet to choose members of the Nominating Committee.

After this was done, the Association adjourned.

THIRD DAY.

Dr. N. S. Davis, of Chicago, offered a brief but pointed report on ozone, which was referred to the Committee on Publication.

The report on necrology was presented by ex-President J. M. Toner, of Washington.

The report on the Catalogue of the National Library, by Dr. H. C. Wood, of Pennsylvania, was received. It stated that Congress had been induced at last to publish two of these valuable works.

Dr. Woodward, of the army, thanked the Association for the warm support it had given his colleague, Dr. Billings, in his efforts to complete a great and necessary work. The report was referred to the Committee on Publication.

Dr. Atkinson, the Secretary, presented the report of the Committee on Publication, which stated the entire work of that committee for the past year. The report was received and disposed of as those above.

The Treasurer's report was next read, and referred to the Committee on Publication.

The Librarian's report was also read, and referred to the same committee.

The next business in order was the presentation of a paper on state medicine, which Dr. Chaille, of New Orleans, had read in the Section of State Medicine, Tuesday afternoon. Dr. Chaille appealed for the thorough establishment of a sound system of state medicine, in which the general government should regulate without interfering with any necessary powers of the State. He argued that it lay in the power of the American Medical Association to effect the reforms needed in the present condition of state medicine. In England, state medicine is easily and judiciously regulated by the influence of the British Medical Association on one central legislative power; while in America this power must be frittered away on the local legislatures of forty-eight states and territories. He argued for a more permanent organization in minor medical societies, and the consequent increased efficacy of the American Medical Association. The paper was pregnant with theoretic principles, strengthened by sound practical suggestions.

Dr. Moses Gunn, of Chicago, Chairman of the Section on Surgery and Anatomy, delivered an address on the most advanced theories on the question and the discoveries of the true nature of "pus," in all of its various exhibitions.

The paper was referred to the Section on Surgery.

Dr. S. D. Gross, of Philadelphia, announced that the Committee on Nominations was ready to report. The following report was then received through the Secretary of the Committee, Dr. Eugene Grissom, of North Carolina:—

The Committee on Nominations present the following nominations:—

President—Dr. Lewis A. Sayre, of New York.

Vice Presidents—

First. Dr. R. Beverly Cole, of California.

Second. Dr. E. M. Hunt, of New Orleans.

Third. Dr. H. O. Marcy, of Massachusetts.

Fourth. Dr. F. Peyre Porcher, of South Carolina.

Treasurer—Dr. R. J. Dunglison, of Pennsylvania.

Librarian—Dr. Wm. Lee, of District of Columbia.

Committee on Library—Drs. Johnson, Eliot, of District of Columbia.

Assistant Secretary—Dr. Walter Gillette, of New York.

Next place of meeting—New York.

Committee of Arrangements—Drs. L. O. Vanderpoel, Stephen Smith, William M. Polk, Robert Weir, Charles I. Pardee, A. A. Smith, T. F. Sabine, of New York; Joseph Hutchinson, of Brooklyn; M. H. Burton, of Troy; and Dr. Parker, of Poughkeepsie.

Committee on Prize Essays—Not yet appointed.

Committee on Publication—Drs. W. B. Atkinson, T. M. Drysdale, A. Fricke, S. D. Gross, Caspar Wistar, R. J. Dunglison, of Pennsylvania; and William Lee, of District of Columbia.

The following nominations for chairmen and secretaries of Sections of 1880, are reported:—

1. Practice of Medicine, etc.—Dr. J. S. Lynch, of Maryland, Chairman; Dr. W. C. Glasgow, of Missouri, Secretary.

2. Obstetrics, etc.—Dr. Albert Smith, of Pennsylvania, Chairman; Dr. Robert Battey, of Georgia, Secretary.

3. Surgery and Anatomy—Dr. W. T. Briggs, of Tennessee, Chairman; Dr. J. Powell Adams, of Minnesota, Secretary.

4. State Medicine, Medical Jurisprudence, etc.—Dr. James F. Hibbard, of Indiana, Chairman; Dr. T. F. Wood, of North Carolina, Secretary.

5. Ophthalmology, etc.—Dr. Bolling A. Pope, of Louisiana, Chairman; Dr. Eugene Smith, of Michigan, Secretary.

6. Committee on Necrology—Dr. J. M. Toner, of District of Columbia, Chairman.

The next business was the reading of an address by Dr. E. S. Lewis, of New Orleans, Chairman of the Section on Obstetrics, etc.

The paper was referred to the Committee on Publication.

The next business was the consideration of Dr. Seguin's report on the metric system. The Doctor made a few remarks in support of his resolutions. They are as follows:—

Resolved, 1. That the American Medical Association adopts the International Metric System, and will use it in its Transactions.

2. Requests that those who present papers at its future meetings employ this system in their communications, or reprints thereof.

3. Requests the medical boards of the hospitals and dispensaries to adopt the metric system in prescribing and recording cases; and that the faculties of the medical and pharmaceutic schools adopt it in their didactic, clinical or dispensing departments.

4. Requests the physicians familiar with the metric system to help their confreres and the druggists in its application; and the delegates present at this session to work up the acceptance of the metric system by their respective county and State societies.

5. Requests our President to name a metric executive committee, of which he shall be the ex-officio chairman, and whose task will be to give unity and rapidity to this metric movement.

On motion they were adopted.

Dr. Chaille, of New Orleans, offered a resolution that Congress be petitioned to allow any student of scientific pursuits to import free of duty any one book for his own use. Adopted.

Dr. Brodie, of Detroit, referred to Judicial Council a query as to the propriety of the use of patent medicines, and a resolution declaring such use against the code of ethics.

Some amendments were laid over to next year.

FOURTH DAY.

The Convention met at 9.30, A.M., and was called to order by President Parvin.

Communications from the Committee of Arrangements were read.

Reports from all the five Sections were read.

A resolution passed by the Section on State Medicine, looking to the thorough organization of State Societies, and prescribing stricter rules for admission into the American Medical Association, was passed.

A communication from the California Medical Association, pressing the necessity of a national quarantine, was read and referred.

The President appointed the following committees:—

To represent the Association abroad—Drs. Seguin, Yandell, Da Costa, Gunn, Turnbull, Warren, and J. T. Hodgson.

Delegates to Canadian Association—Dr. H. Hutchins, Dr. W. Brodie.

On Dr. Chaille's resolution on Public Hygiene and its regulation by Congress—Drs. Pratt, Davis, Garcelon, Gross and Bell.

The Committee on Nominations reported their work complete, and presented the following report:—

Time of meeting—First Tuesday in June, 1880.

Place—New York.

Committee on Prize Essays—Drs. Austin Flint, Chairman; Alfred C. Post, Joseph Hutchinson, J. W. S. Gouley, Montrose H. Pallen.

Members of Section on State Medicine, Public Hygiene, etc.—Drs. W. H. Hawkins, Arkansas; Jerome Cochrane, Alabama; W. F. Cherry, California; C. Dennison, Colorado; C. A. Lindley, Connecticut; Wm. Marshall, Delaware; Thos. Antisell, District of Columbia; J. P. Wall, Florida; J. P. Logan, Georgia; S. Brandeis, Kentucky; S. E. Chaille, Louisiana; A. P. Snow, Maine; T. B. Evans, Maryland; H. I. Bowditch, Massachusetts; H. B. Baker, Michigan; C. N. Hewett, Minnesota; Wirt Johnston, Mississippi; H. H. Mudd, Missouri; J. Black, Nebraska; G. P. Conn, New Hampshire; D. O. English, New Jersey; A. N. Bell, New York; J. C. Walker, North Carolina; J. C. Reeve, Ohio; H. Carpenter, Oregon; Benjamin Lee, Pennsylvania; E. M. Snow, Rhode Island; R. A. Kinlock, South Carolina; Dr. T. A. Achison, Tennessee; H. W. Brown, Texas; F. D. Cunningham, Virginia; L. C. Butler, Vermont; E. A. Hildreth, West Virginia; J. T. Reese, Wisconsin; Joseph R. Smith, United States Army; A. L. Gihon, United States Army.

The Committee also reported regulations for printing the proceedings of the Association and the deposit of its funds.

The address of Dr. Hermann Knapp, of New York, the Chairman of the Committee on Ophthalmology, was next in order. The address was referred to the Committee on Publication.

The Committee on Prize Essays reported only one essay for a prize. This was written by Dr. A. McLane Hamilton, of New York, and was on the subject of Primary and Secondary (local) Degeneration of the Lateral Columns of the Spinal Cord. The Committee highly commend the essay, and recommend that a prize of $100 be awarded for it. An essay on "Explorations in Physiology" was highly commended, but the second prize was withheld.

Dr. N. S. Davis, of Chicago, said it gave him peculiar pleasure to offer one resolution. He then read a resolution of thanks.

The resolution was adopted by a unanimous rising vote of the Association.

The last business in order was the installment of the new officers.

Dr. Louis A. Sayre, of New York, the President elect, came forward, and Dr. Theophilus Parvin, of Indianapolis, the retiring President, addressed the body in a few well chosen words. He was followed by Dr. Sayre, and the meeting then adjourned.

Editorial Department.

Periscope.

Treatment of Internal Aneurism.

On this subject Dr. M'Call Anderson said, in a paper before the Glasgow Clinical Society, he would refer to three methods of treatment—1. That known as Tufnell's method. 2. The treatment by iodide of potassium; and 3. That by galvano-puncture. Tufnell's treatment, which was not original, but only a modification of Valsalva's plan, was to enforce the most absolute rest, with a starvation diet limited to ten ounces of solids and eight ounces of fluids in the twenty-four hours. Dr. Anderson then narrated a case of thoracic aneurism, showing the very marked improvement which had resulted from carrying out this plan of treatment. He would recommend that fluids should be sparingly drunk, and also the food should be very moderate in quantity, partly to avoid derangement of the digestive organs, and partly to prevent the augmentation of the volume of blood. But a starvation diet he did not approve of, and he believed that it would do more harm than good. The iodide of potassium treatment was introduced by Nélaton and Bouillaud, in 1859. In 1862, Dr. Chuckerbutty brought it prominently before the profession in the *British Medical Journal*; and more recently Dr. Balfour had given it a most thorough trial, his first case being treated in 1867. Dr. Balfour had expressed a very high opinion of it. He said, in his work on "Diseases of the Heart and Aorta," (p. 368), "When we find a drug relieving suffering, mitigating every other symptom, and restoring capacity for exertion when lost, and that not occasionally, but in every case in which it has been fully tried, all who know anything of aneurism will agree with me, that it must be a remedy deserving of the fullest confidence." In some cases of aneurism the disease was simply traumatic, but in the majority there existed degenerations of the coats of the vessel, such as are apt to occur in advancing years. There could be no doubt, however, that the disease was also sometimes syphilitic in its nature, and this was believed to be one reason why soldiers were so often the subjects of aneurism. Now he supposed they were all agreed that if there were reason to suspect a syphilitic basis, iodide of potassium was essential; and in most cases, if not in all, it relieved uneasiness and pain in a remarkable way. This was partly due to the fact that it diminished the heart's action, and lowered the blood pressure; it also sometimes acted as a diuretic, thereby diminishing the volume of the blood, allowing the aneurismal sac to contract, and thus taking off the pressure from the nerves implicated. But that it mitigated every symptom in every case, as Dr. Balfour held, was a different matter altogether, and he did not think that this sanguine view was ever borne out by Dr. Balfour's own published cases. Dr. Anderson then narrated two cases of thoracic aneurism, in which, after the failure of other remedial measures, including the use of iodide of potassium, in doses of half a drachm, three times a day, for five or six months, he had resorted to electrolysis. The one case (already published) was the first he had operated upon in this way; and, although the woman had died from rupture of the aneurism into the pleura, owing to her own subsequent recklessness, the relief to the patient was very great, and she had engaged in arduous work for more than a year after her dismissal. The preparation already shown to the Society (January 20th, 1874), and included in the collection of specimens at the present meeting, presented evidence of complete consolidation. The other case was that of a man, still alive (who was examined in one of the side rooms by several of the members and visitors, before the discussion began). He had been treated in the Western Infirmary, by galvano-puncture, about fifteen months ago; the tumor, formerly bulging in the third left intercostal space, had now nearly disappeared, and the presence of the aneurism could scarcely be recognized; the patient, too, said that now "he would not know that anything was the matter" with him. As regards galvano-puncture, he limited himself to mentioning the rules which at present guided him in carrying it out. First, as to the

battery. He used Stohrer's large-celled continuous current battery, with two drachms of a claret-colored solution of chromic acid added to the charge in each cell, as recommended by Althaus, to increase the chemical effects. The needles were insulated to within half an inch of their points by a coating of vulcanite; they must be very sharp, with angular points, and the greatest care must be taken that there was nothing like a shoulder at the point where the vulcanite commenced. He preferred the positive pole, the clot being firmer than that formed at the negative pole. In every case, immediately before the operation he tested the battery with white of egg. A great injury might be done by too strong a current, or using it for too great a length of time. He generally employed from four to eight cells, and never continued the operation longer than an hour; but there was no hard and fast rule as to this point. They must not look for an immediate result; in fact, for the first few days the symptoms might appear to be worse, instead of better. The treatment was applicable only in the minority of cases. Where the aneurism was high up, or implicated some of the great blood vessels, he was not quite sure but that the best treatment was distal ligature.

Locomotor Ataxy Simulated by Syphilis.

In an address by Mr. Jonathan Hutchinson, in the *British Medical Journal*, he writes—

Under the term locomotor ataxy we recognize a condition of liability to nervous disorder, one of the most conspicuous symptoms of which is a failure of the power of muscular co-ordination in the lower extremities. It is clear that this symptom is only one part of the malady, for the patient is liable to other and quite distinct forms of paresis. He may become blind, may have ptosis or ocular paralysis, and is liable to severe attacks of disturbance of the abdominal organs. The pathology of the malady is to a certain extent made out, and to some extent is yet obscure. It seems clear that low forms of chronic inflammation, leading to permanent degenerative changes in the posterior columns of the cord, occur; and that these processes, once initiated, tend to spread in certain definite paths. It seems clear that the vasomotor system is often much involved. We do not, however, yet fully understand the bond of connection between the different groups of symptoms; nor do we know the special causes by which they are produced. It seems probable that a variety of causes may in turn or together take shares in producing this curious and very common malady. Now, one of the most remarkable facts in the history of syphilitic simulation is, that all the phenomena of locomotor ataxy may be, and often are, closely imitated. So close is this imitation, that it becomes one of the most difficult tasks in diagnosis with which I am acquainted, to distinguish between them. Case after case comes under my observation, with the suggestion that the patient is suffering from a syphilitic taint, and I find that all the symptoms range themselves under the head of ataxy. The small and sluggish pupils, the feeble bladder, torpid bowels, the amaurosis, the ptosis and failure of ocular muscles, the stabbing pains, the defective sensation in the feet and diminished coördinative power, the whole group of symptoms, not omitting the abdominal crises, all are there, and yet all are remediable to some extent, if not wholly, by specific treatment. Excepting in the facts as to history, and in the effect of specifics, there is little or nothing upon which to base a differential diagnosis. Whatever may be the parts attacked in non-specific locomotor ataxy, and whatever is the tendency as regards local spreading, it is clear that syphilitic disease may affect the same parts, may spread in the same directions, and may produce precisely similar results. If the question be put, is there really any non-specific type-form of locomotor ataxy? is it not rather probable that the name is given solely to the results of serpiginous syphilitic changes in the nervous centres? we must, I feel sure, answer it definitely in the negative. It is probable—nay, it is certain—that the disease may begin independently of syphilis; and notwithstanding the frequency of the latter malady, probably not more than half of those who become the subjects of ataxy have ever had it. It is certain, then, I repeat, that we have, side by side, two maladies almost exactly alike, one specific and the other not so. It may be asked further, whether, in the cases in which ataxy happens in syphilitic persons, it is not yet probable that the ordinary causes are its real producers, and the syphilis merely an accidental concomitant. To this, again, a decided negative answer must be given as regards, at any rate, a considerable proportion of cases. They are really syphilitic, and are curable only on that hypothesis. On this point valuable evidence has been produced by M. Fournier, of Paris, who has published several remarkable cures by the iodide of potassium, and who urges that whenever the patient has had syphilis this drug should be carefully pushed.

The Diagnosis between Erythema and Mild Scarlatina.

Dr. W. B. Cheadle writes, in the *British Medical Journal*—

That erythematous eruptions closely resembling the rash set up by the poison of scarlet fever are also produced by other agents, is undoubted. Such are the so-called medicinal rashes which occasionally follow the administration of belladonna, of copaiba, and of quinine. Similar general scarlet rashes have been observed by Dr. Handfield Jones in malarial disorders in children, and by myself in a very marked form in a severe case of tertian ague in a child. But, further, I think there can be no doubt that a scarlatiniform eruption, which is not contagious and not followed by the sequelæ of scarlatina, does arise in various traumatic conditions independently of the scarlatinal poison. I have seen it more than once follow paracentesis thoracis for empyema, after various surgical operations, and in a case almost exactly parallel to the one related by Dr. Braxton Hicks. One of my own children received an injury to the thigh, which was followed by an abscess. There was no external wound; but at the commencement of the suppurative process a

general scarlet rash appeared. It could not be traced to infection; it did not infect others. The rash disappeared in twenty-four hours; it was not followed by desquamation or sequelæ. In such a case, as Dr. Braxton Hicks points out, the introduction of scarlatinal poison from without by inoculation is out of the question. The eruption must be due to the absorption of scarlatinal poison through the ordinary channels, or of septic or deleterious matter developed *in loco*, or otherwise a result of the traumatic pyrexia.

Now, although there are, I believe, no certain and absolute data by which this "surgical erythema," as I am in the habit of calling it, can be at once distinguished from true scarlatina in its slighter forms, yet there are one or two points to be noted in connection with it, which afford some aid toward a correct diagnosis. Surgical erythema, as far as my observation goes, is constantly wanting in certain leading features of typical scarlatina.

1. There is no swelling of the tonsils, no enlargement of the glands, although the fauces may be reddened.

2. The tongue never presents the strawberry appearance. It is furred, perhaps; but the coating has not the whitish or yellow tint seen in scarlatina.

3. The rash is often not universal, but confined to the body and the parts covered by clothes, the face being free. Sometimes it is in more or less distinct patches, with portions of comparatively clear skin between. It rarely lasts more than twenty-four hours, and is never, in my experience, followed by desquamation; it is not sufficiently intense and its duration too short.

Now, these variations from the perfect scarlatinal type are, no doubt, met with in extremely mild cases of scarlatina. They merely narrow the issue by excluding *well-marked* scarlet fever. The decision between surgical erythema and the slighter forms of scarlet fever can only be arrived at by the additional evidence, by the history and symptoms. Not unfrequently a positive conclusion is impossible, and the only safe practice is to isolate such cases, at any rate for a time.

Nature of Hydrophobia.

A writer in the *Journal de Médecine* gives the following curious case. A woman of highly nervous temperament was bitten by a dog in the right thigh. From that moment she became melancholy and sleepless, and was tortured by the thought that she had not been cauterized; later on she had violent paroxysms, attempted to commit suicide several times, and was extremely emaciated and feeble. The sight of dogs filled her with horror, she could not swallow liquids, had violent pain in the throat, and tried to strangle herself. The treatment had to be adapted to her mental state. The wound was cauterized, and she herself fed by the bowels, having chloral administered three times daily after each meal. It proved highly successful. We see by this case how difficult it often is to ascertain the exact duration of the stage of incubation in hydrophobia. Here the outbreak of the disease seemed to follow close upon the bite. It may also tend to show how easily any particular method of treatment which may have been hit upon by chance may obtain unmerited reputation and success. A medical practitioner, Dr. Anderson, has been led, by this case of mania, to add a third class of rabies—viz: rabies ending with mania—to the two previously known classes of rabies vera and rabies falsa. According to his theory, hydrophobia is a proteiform neurosis, which does not manifest itself with equal force in all cases; it has more affinity with tetanus and eclampsia than with virulent diseases, and is caused by excitement of the peripheral nerves.

Objections to Milk as Food.

At a meeting of one of the branches of the British Medical Association, Mr. Gay read an indictment of milk as food. He pointed out that milk, when once exposed to the air and at rest, underwent a series of chemical changes, through the influence of external and internal agencies, which ensued in its degradation and decay, its last stage being that of a limpid fluid, mainly composed of water, salts, and acids, among which figured the lactic, butyric, caprionic, and capriolic. In this downward career it was varied by becoming the *habitat* of broods of vibriones of different kinds, and according to Prof. Lister, of a certain bacterium—the *Bacterium lactis*—and by certain carpetings of its surface by oïdium and other varieties of mould. If treated with yeast and well shaken at an early part of its history, mare's, and perhaps other, milk might be converted into an "exhilarating" and, it was said, a therapeutic agent—koumiss. Could it be affirmed, in the face of these allegations against milk, that, after the period of lactation, it was suited as an article of human food? Of the products of the decomposition of milk, some were believed to be actually injurious when taken into the organism—such as lactic and butyric acids; while others, if less hurtful, were certainly not elements of food. On the other hand, in the absence of any positive knowledge as to the source of the various exanthems, measles, scarlatina, and the like, characterized by fever, and, without doubt, related to some form or forms of blood-poison—disorders that abounded mostly after dentition, and when milk was often the predominating, if not the sole, article of food—was it unreasonable that we should turn with suspicion to these unwholesome ingredients of decaying milk for their explanation?

On Morbus Coxarius.

The following propositions in regard to this disease are maintained by Dr. H. McNaughton Jones, in the *British Medical Journal*:—

Morbus coxarius is a disease which in a large number of cases has a purely constitutional or strumous origin, and may occur without any injury, or from so slight a shock to the joint that we cannot, strictly speaking, assign the term traumatic to it.

Aspiration, to be successful, must be performed in the earlier stage of effusion or of pus formation, and hence the importance of detecting the

first sense of fluctuation, and watching closely the symptoms of approaching abscess in or about the joint.

Though we may be guided by the situation of the sinuses, yet it is extremely difficult, by means of the probe, to ascertain the extent of the joint implication; and in those cases where sinuses form, and suppuration has occurred without accompanying symptoms of waxy degeneration, the propriety of excising the head of the bone should be considered, and the earlier this step is taken, when once the necessity for it is foreshadowed by the urgency of the case, the better.

The Treatment of Albuminuria by the Inhalation of Oxygen.

At the meeting, on January 8th, of the Société de Thérapeutique, M. Dujardin-Beaumetz read a paper on a case of albuminuria, in which the albumen had entirely and rapidly disappeared after some inhalations of oxygen. The patient had reached the last stage of the disease; every diuretic had been employed, but without success, when inhalations of oxygen were resorted to. The albumen disappeared within the following twenty-four hours, and had not reappeared since. Twelve days had elapsed, and the author wished to know if similar cases had been observed before, and if his treatment might be considered as attended by permanent success.

A discussion having been raised on the subject, it was remarked that similar cases had been known to occur, only the effect of the cure had never been permanent, the albumen generally reappearing after two or more months.

The Contagion of Yellow Fever.

At a recent meeting of the London Epidemiological Society, Mr. Lawson, Inspector General of Hospitals, stated that from his observations on the subject a factor of very extensive operation becomes active from time to time, determining the production, in suitable localities, of emanations the immediate cause of the disease. Such localities may be on shore or in ships; in the latter the source of the disease may continue active for months, during which they may carry it to distant countries, and there cause yellow fever. At Swansea, in 1865, the disease occurred in persons 150 to 200 yards from the source; and at St. Nazaire, in 1861, a mason, not known to have been nearer the infected vessel than 245 yards, was attacked. A Dr. Chaillou, who visited some of the cases which occurred in one of these outbreaks, died of what was considered yellow fever; but as bilious intermittent of unusual severity was prevailing at the time, and there is nothing mentioned in the details of the case sufficient to separate it from others, it cannot be accepted as a case of yellow fever, or as showing a power of transmission from man to man which was not displayed in any other instance on this occasion. Porous materials, such as clothing, etc., may undoubtedly imbibe a quantity of the emanation if exposed to places where it is generated, and some American authors state that when a box of such articles, packed in a yellow fever locality, has been opened at a distance, that disease has sometimes been excited among those present. The general impression in yellow fever localities, however, is that the disease produced by the quantity carried in the ordinary clothing is infinitesimally small. There is no evidence to show that persons laboring under yellow fever, or the bodies of those who have died of it, give off a poison capable of exciting the disease. Should the emanation from a ship with a source of yellow fever on board, or fever fomites, meet with a suitable locality on shore, can it fructify so as to produce a fresh focus of the disease giving rise to a similar emanation? Many believe it can, but to establish the point it is necessary to exclude the possibility of the disease having arisen at such points under the action of the general factor mentioned above, which at present there are no means of effecting.

How to Measure a Skull.

The following directions are given by Dr. W. H. Flower, F.R.S., in a lecture before the Royal College of Surgeons:—

The length of a skull is measured from the middle of the forehead, above the glabella—the *ophryon*—to the most prominent part of the occipital region. The breadth is the greatest lateral breadth in the parietal region. The cranial index, which is the expression of the relation of the breadth to the length, is found by a simple calculation, the length being taken as 100. When the index is over 80, the skull is called *brachycephalic;* when it is below 75, it is said to be *dolichocephalic;* those between 75 and 80 are *mesocephalic.* The height is the distance between the basion and the bregma. The orbital index is the relation of height to the width of the anterior margin of the orbit cavity. The average in Australian skulls is 82, in European 88, which gives a fair indication of the difference of form in this part in the two races. The nasal index is the relation of the height of the bony framework of the nose to its breadth. The height is measured from the nasion to the lower border of the aperture, or base of the nasal spine. The breadth is the greatest breadth of the aperture. This is one of the most useful of all the cranial indices in distinguishing races. The average nasal index of all races is about 50. Races or individuals in which the nasal index is from 48 to 52 are called *mesorrhine;* those in which the index is below 48 are *leptorrhine,* or narrow nosed; those in which the index is above 52 are *platyrrhine,* or broad nosed. To this latter category the Australians belong, the average index of their nose being 57. The condition of the frontal suture should always be observed in examining a skull. In its early stage, the frontal bone is developed in two lateral halves, united by a suture. At the age of two years, this suture is generally obliterated. Sometimes, however, it remains open; indeed, if it be not obliterated during the second year, it generally remains open throughout life. When this suture is permanently open, the skull is said to be *metopic.* Among English skulls, it is found to be open in about one in ten, but in one hundred Australian skulls here and in other museums in this country

there is not one instance where it is closed. In this respect they resemble the anthropoid apes, among which metopism is rare, though among many still lower forms of mammals, as the Ungulata, it is the normal condition.

Reviews and Book Notices.

NOTES ON CURRENT MEDICAL LITERATURE.

——Dr. Cassells, of Glasgow, has undertaken the translation of Professor Politzer's "Lehrbuch der Ohrenheilkunde," at the author's request, and in fulfillment of a promise made to Professor Politzer many years ago. The translation of the first volume into English is well advanced.

——The *Medical Herald* is the title of a monthly journal commenced this month in Louisville, Ky. It is edited by Dr. Dudley S. Reynolds, published at two dollars a year, and promises to be a valuable addition to our periodical literature.

——An abstract of the report of the Special Committee on Croup, of the Illinois State Medical Society, embracing the details of eighty-three cases of tracheotomy, may be obtained from the Chairman, Dr. H. Z. Gill, Jerseyville, Illinois.

——The Minutes of the Medical Society of the County of New York, 1806–1878, have been edited under the supervision of Dr. A. E. M. Purdy, and published by the Society. Part 1, of sixty-four pages, carries the reader to 1808. It is a historical record that well deserved preservation by the printing press.

——From Sydney, New South Wales, we receive a shilling pamphlet entitled "Mediums and their Dupes; a complete exposure of the chicaneries of professional mediums, and an explanation of so-called spiritualistic phenomena." The principal author is Dr. Samuel T. Knaggs, and it is to be hoped that this exposure of the commonplace trickery with which mediums fool their dupes will go far toward rendering their business of no value in the Antipodes.

——"The School Garden" is the title of a valuable little work by Prof. Erasmus Schwab, of Olmutz, translated by Mrs. Horace Mann. It is a strong and timely plea for attaching a garden to every school house. Considerations of good health, good taste and refined culture unite in supporting this project, and we sincerely trust that the educators of America will read and ponder well the many and cogent arguments in favor of the scheme advanced by Prof. Schwab. Paper, pp. 92. Published by M. L. Holbrook & Co., New York City. Price 50 cents.

——Messrs. Lindsay & Blakiston, of this city, make an interesting announcement. It is of a series of "American Health Primers." The series will consist of small volumes, on subjects pertaining to Sanitary Science and The Preservation of Health, written by American authors of established reputation, selected with reference to their special knowledge of the subject from previous study, or as private and public teachers. They will be written from an American standpoint, with particular reference to our climate and modes of life. The subjects selected will be of vital and practical importance, and treated in as popular a style as is consistent with their nature, technicalities of language being avoided. Each volume will be illustrated by engravings, when the text can thus be more fully explained to those not heretofore familiar with the structure or functions of the body. The editor of the series is Dr. W. W. Keen. The first volume is "Hearing, and How to Keep it," by Dr. C. H. Burnett. It forms a very neat 12mo, of 150 pages, and although in parts too full of learned terminology, will be instructive to all general readers. The uniform price of the volumes will be 50 cents each, in cloth, and they will be issued about one a month.

——Dr. Charles T. Reber, of St. Louis, has issued, through Geo. O. Rumbold & Co., a small work of 112 pages, to show that what is called malarial poisoning is brought about by paresis of the sympathetic nerve centres from over-excitation by high and long continued solar heat. He speaks, he tells us, from an observation of thirty years of professional life in malarial districts. It is not likely that Dr. Reber will make many converts to his opinions. They are in conflict with many theories which have greater inherent probabilities—the germ theory, for instance—and do not explain many facts so well as that hypothesis.

——A second edition of Mr. Charles Higgins' "Ophthalmic Out-patient Practice" has been published. The book is not only useful for the hospital physician and the student, but is very convenient for the general practitioner, who, while not pretending to the depths of the eye specialty, proposes to treat according to the best rules the ordinary cases of eye troubles he encounters in his practice. The portions we have read of the book have shown much ability in describing the symptoms of such ocular troubles. Published by Lindsay & Blakiston. pp. 116, 12mo, cloth. Price 60 cents.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	$5.00
Half-Yearly Compendium of Med. Science,	2.50
Reporter and Compendium, - - -	7.00
Physician's Daily Pocket Record, - -	1.50
Reporter and Pocket Record, - - -	6.25
Reporter, Comp. and Pocket Record, - -	8.25

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

D. G. BRINTON, M.D.,
115 South Seventh Street,
PHILADELPHIA, PA.

THE INCREASE OF PHYSICAL EVIL AND ITS REMEDY.

In the May number of the *Atlantic Monthly* are two articles, the one optimistic in the extreme, pointing out in a cheerful tone and with plenty of "facts and figures," how much better off we are than were the generations of our ancestors; the other article, strange to say, of a very different ring, filled with gloom at the increase of poverty, misery and crime in this and other countries, compared with the almost arcadian happiness of half a century ago.

The same contrast of opinions is apparent elsewhere. At a recent meeting of the Architectural Society of Liverpool, Mr. Boult read a paper showing, or designed to show, that the sanitary condition of that borough, after all the expenditure and improvements carried out, is no better than that of the parish in 1842, before the Local Health Act was obtained, or any of the improvements were effected. This assertion is based upon the statement that the rate of mortality in the borough in the years 1837-41 averaged only 31.5 per 1000, whereas, in the present day, the death-rate for the borough "may be assumed as not less than 35 per 1000; so that the rate has actually increased 3.5 per 1000." Well might Mr. Boult parenthetically exclaim, "such a condition of affairs is most deplorable, very startling, and very discouraging."

Of course, his statistics were attacked, but even the most bitter of his critics, the *Lancet*, is obliged to confess that in the seven years, 1865-1871, the death rate was 34.3 as against 31.5 in 1837-41. All the accounts of the misery, destitution and unhealthfulness of the English lower classes in this present year of 1879, agree in stating them to be in excess of anything known for years.

The same is true of Germany. The wealth brought in from France in 1870-71 seems to have been a part of the hoard of the Niebelungen, the Rhinegold, which, says the old Saga, always carries a curse to its owner. France getting rid of it, has prospered financially and politically, ever since; Germany, getting it, has steadily sunk in finances, and her statecraft is rotten with the infection of socialism and despotism.

Not different is it in Italy, as the most recent statements show. The Provincial Commission of Mantua reports that while in Lombardy, in 1830, there were over 20,000 sufferers from pellagra, twenty-six years later there were over 38,000, and that the number still increases. The report describes the affection as a specific constitutional disease, produced by degradation and misery, and characterized by symptoms of general prostration, desquamation of the epidermis on exposed parts of the body, and subsequent formation of rhagades and bullæ.

It remains, in fact, apparent, that the rapid increase of city populations, the extension of machinery, and the accumulation of material wealth, has, since 1850, outstripped the education of the benevolent instincts, and the means of sanitary improvement. The materialism of science has united with the pandering of the pulpit to sensationalism and mammon, to defeat the growth of the religious instincts; and state medicine, to which we must, after all, look for

the healing of these sores on the body politic, has been too little appreciated, indeed, too much disowned, by both the statesman and the priest, to have had a fair field for its endeavors. This condition of things, we fully believe, is only temporary. Another half century will see state medicine in the position which belongs to it; and the miseries of mankind will be assuaged by knowledge joined to benevolence.

DEMONSTRATIONS OF THE GERMS OF INFECTIOUS DISEASES.

In a recent number of the Reporter (1144, p. 104), we explained the remarkable discoveries by Drs. Koch, Klein, and Klebs, of the germs which produce syphilis and pneumo-enteritis. We now announce that the veteran, M. Pasteur, believes he has discovered those which produce puerperal fever and malignant pustule. His studies were related in a discussion before the Paris Académie de Médecine, March 11th, and are quoted at length in the London *Medical Record.*

The primary organism which engenders puerperal fever, he describes as presenting itself in the form of cells united to each other in series of two, four and six, and each having a medium diameter of two-thousandths of a millimeter.

M. Pasteur's researches on malignant pustule have proved to him that the disease was produced by the presence of the bacteridium discovered in 1860 by M. Davaine, and this demonstration was made by the application of the method of culture which M. Pasteur employed in 1857, and which enables him to obtain microscopic organisms in a state of purity—the only means of arriving at certain results. An infinitely small drop of the blood from a case of malignant pustule is taken, and it is sown in the cultivating fluid constituted by a froth of beer yeast; a little drop of this fluid is taken again, and sown in a new medium of the same kind, and so on. Thus the media of culture may be multiplied indefinitely to a certain extent, during years, by the aid of a single droplet of blood taken originally from the case, and one may have always a liquid the inoculation of which in certain animals, such as the sheep or guinea pig, reproduces in those animals malignant pustulæ. If this fluid is filtered through a plaster filter, nothing results from the inoculation of the fluid parts which have traversed the filter, but if the figurate elements which remain on the filter be inoculated, all conditions of the pustular disease are produced. It is the same with the cholera of fowls, and perhaps, with puerperal septicæmia.

Here, then, are two diseases which are infectious in the highest degree, and from the outset of which the theory of germs receive striking demonstration. Why should it not be the same with others? But time and numerous and patient researches are needed, in order to succeed in dissipating the obscurities of a subject of which the study has hardly commenced.

Notes and Comments.

Statistics of Insane Hospitals.

In a recent paper, Dr. Conrad, of Baltimore, stated that insane asylum reports show a very large percentage of recoveries, ranging from 60 to 90, and in one case 100 per cent.; while compared with these exhibits the almshouse care and treatment realize only 7 per cent. of recoveries. The data upon which such reputed success has been claimed has been shown by indisputable evidence to be fallacious and untruthful. The error of the asylum reports consists in counting the cases recovered and not the *persons.* Dr. Pliny Earle, superintendent of a Massachusetts asylum, has enumerated instances of this method of computing the ratio of recoveries. One man was discharged recovered seven times in nine years and afterwards committed suicide; another was discharged fourteen times, another twenty-six times, and again a woman was admitted fifty-nine times, and discharged cured, in twenty-nine years, and finally died insane.

Poisoning by Veratrum Viride.

Dr. W. N. Ames, of Miss., writes us—

"In looking over my file of the Reporter, I discovered that Dr. R. E. Van Giesen, of the New York Path. Society, reported December 3, 1870, Medical and Surgical Reporter, a fatal case of gastritis, produced by veratrum viride, 10 drops every 3 hours. Also a case, same journal, May 10, 1873, reported by Dr. Madison Marsh, fatal dose of 33 drops veratrum viride."

Precautions in Anæsthesia.

Dr. Chisholm, of Baltimore, has administered chloroform in more than ten thousand cases, without a single serious accident. He always gives a full dose of whisky before the anæsthetic. Another point he insists on is that in suspending the patient by the feet, we have the very best means of exciting and sustaining the vital organs, by sending blood, the natural stimulus, to the important nerve centres; and that what would be otherwise very alarming symptoms during anæsthesia, well calculated to frighten terribly the inexperienced, soon disappear when the patient is placed in an inverted position. His hospital assistants are so familiar with these death-like appearances, and their simple means of correction, that instead of rushing about wildly for fans, hypodermics, batteries and what not, they quietly elevate the feet, hanging the head downward, with the chin pushed back, and confidently await restoration; invariably, one or two minutes produces the desired effect, and the operation can be proceeded with.

Treatment of Piles by Carbolic Injections.

The following rules for the treatment of piles by hypodermic injection of carbolic acid are given by Prof. E. Andrews, in the Chicago *Medical Journal and Examiner*—

1. Inject only internal piles.

2. Use diluted forms of the remedy at first, and stronger ones only when these fail.

3. Treat one pile at a time, and allow from four to ten days between the operations.

4. Inject from one to six drops, having smeared the membranes with cosmoline, to guard against dripping. Inject very slowly, and keep the pipe in place a few moments, to allow the fluid to become fixed in the tissues.

5. Confine the patient to bed the first day, and also subsequently if any severe symptoms appear. Prohibit any but very moderate exercise during the treatment.

The Pulse in Different Races.

A well known anthropologist, Dr. A. Weisbach, of Constantinople, alleges that the rapidity of the pulse beat varies in different nations, within very wide limits. Thus, the pulse of the Congo negro beats but 62 times in a minute, while the quickest pulses are found among the Tagals (80), and the Madurese and Nikobars (84). The Japanese pulse beats 78 times per minute, and the Chinese 79.

It would require a wide range of observation to verify these statements.

The Management of Bow Legs.

At the conclusion of an article in the Maryland *Medical Journal*, Dr. V. P. Gibney mentions the following means for the redressing of bow legs:—

1. Constitutional measures and delays in attempts at standing or walking make up the principal factors in prophylaxis.

2. The mother's thumb and forcible straightening, with or without an anæsthetic, constitute the methods to be employed, while the bones yet possess the quality of springiness.

3. Mechanical appliances are to meet the indications for continuous pressure, elastic or non-elastic, in such cases where the mother's thumb or springing is inoperative, or may be used in combination with the springing.

4. Osteotomy and osteoclasis for such cases as have passed the fourth or fifth year.

The Progress of Therapeutics.

Speaking of the delusive character of many reports of cases, an English writer observes—

Rational therapeutics is to be advanced only by cultivating the greatest exactness in the recording of cases and the estimation of results, and by reasoning cautiously and from wide data—*i.e.*, a large number of cases—and, above all, by observing the most impartial truthfulness in the publication of our experience. Vague statements, and such a *petitio principii* as a "typical case," should be left for advertising druggists; they should have no place in scientific medicine.

"Charcot's Crystals."

These are minute crystalline bodies, found in the blood of patients who have died after suffering from profound and long continued alteration of the blood. At a late meeting of the Manchester Medical Society Dr. Moritz exhibited some specimens of these crystals which had formed after death in a clot taken from the blood of a leucæmic patient. It was not certain what was the composition of these crystals. They were rhombic needles, and apparently consisted of a phosphate of an organic base. They were insoluble in ether, alcohol, and chloroform; soluble in acetic acid and caustic soda.

Fuchsin in Albuminuria.

Some ten cases of chronic albuminuria and anasarca, treated with fuchsin are reported from Paris. M. Bouchut has the credit of the suggestion. The daily dose of fuchsin is from ten to

twenty-five centigrams, continued for a long time, five or six months. There is no danger in this; the albumen diminished rapidly in the urine, and the dropsy disappeared. The treatment is highly recommended.

Correspondence.

Abscess of Liver Opening through the Lungs.

Ed. Med. and Surg. Reporter:—

The following case has several, to me, remarkable and puzzling features:—

Mr. K. L., a farmer 26 years, until July, 1878, enjoyed uncommonly good health. During the month of July he was overheated while at work in the harvest field; on going to a cool spring and bathing freely, was thrown into a chill. He was taken home, and the family physician summoned, who was of the botanic kind. He treated the case from then till January as pneumonia and consumption. On January 21st, 1879, his father asked me to see him. Upon examination I found a dullness on percussion, extending from the fourth rib downward to the crest of the ilium, apparently ascites, and swelling to such an extent that his clothes could not be fastened. He complained of frequent pain in the region of the liver, with corresponding pain in point of shoulder, with a disgust for all kinds of food. Upon lying down, he expectorated freely a dark pneumonic sputa, but upon closer examination I found it to be of a quality similar to the excretion from an abscess. This, with other attending symptoms, I decided to be from hepatic abscess. Coming to this conclusion I prescribed bark, acids and good diet for ten days, when I gave a few good doses of calomel and Dover's at bedtime, to be followed in the morning with cinchonidia and golden seal, the latter partaking of his botanic treatment. The calomel acted as finely as could be expected, producing a copious bilious discharge, and my patient improved right along for a month or more, when he, from some exposure, contracted quite a cold. This seemed to affect the right lung, causing, in my opinion, a closure of the fistulous opening through the lung, and a second filling of the abscess. On its second opening I was called, and witnessed one of his hemorrhages, which to my natural eye alone appeared to be from the liver, containing, apparently, the medullary substance of the liver itself. The quantity expectorated is generally in proportion to the length of time that the patient has ceased to expectorate.

This condition is liable to repeat itself. It generally causes the patient to be greatly depressed so long as the fullness exists. But when the abscess discharges the patient has an upward tendency. At the last time there was any quantity expectorated I saw it, and it had every appearance of there being a full-sized abscess. I suppose I saw not less than twenty ounces; of this quantity, not more than three or four ounces were blood. His pulse is of good volume, never too fast, sometimes as low as 68; breathing good, unless just before there is an emptying of the abscess, which, when full, presses against the lung, forcing it to the apex of the chest on the right side. The opening from the abscess is through the diaphragm, emptying into the bronchia in a line under the right nipple, as traced by the patient himself. His cough troubled him most on lying down and getting up; very little through the day or night. He expectorated freely during the time of the diminishing of the abscess, though of a very healthy pus.

I write the above, asking the opinion of your readers in regard to the treatment of this exceptional case. H. A. Moseley, M.D.

Wartrace, Tennessee.

Rare Form of Mammary Tumor.

Ed. Med. and Surg. Reporter:—

The following brief report of an anomalous association of neoplastic formations may prove of interest to some of your readers.

Mrs. M., aged 44 years, childless, having a good personal and family history, noticed, about six months ago, that her right breast was enlarged. This circumstance excited her curiosity, and on examination she discovered a tumor of diminutive size. Attaching little importance to this disclosure, she neglected to seek medical advice, until lancinating pains and augmenting size of the breast occasioned alarm.

At this period—six months after discovery—the breast was of normal color, symmetrically enlarged, and the nipple prominent. Palpation elicited two firm, elastic bodies. One apparently involved the entire mammary gland, and adhered slightly to the skin along its lower border. The second was situated at the upper and outer angle of the above; seemed connected to it, and about the size of a hen egg. Both were movable in the surrounding tissues.

The patient was not cachectic, the axillary glands were normal, primary assimilation, the catamenia, and, in fact, all functions of the body, presented healthy characteristics.

Excision was advised, and performed by Dr. Cassidy.

On dissection, the following interesting features were manifested: The larger tumor was encapsuled, lobular, elastic, of firm consistency, reddish in color, and contained a cyst, one-half inch in diameter. The smaller formation was continuous with the capsule of the larger growth, and from it it was evidently developed. Its (the smaller) consistency was firm and tough, of a grayish-white color, its cut surface smooth, glistening, and covered with a small amount of fluid.

The microscope demonstrated remarkable peculiarities. The largest neoplasm consisted of round and spindle cells, intercellular substance and fibre, with remnants of the gland. The capsule was composed of mature fibrous tissue. Sections of the smaller tumor, near its point of origin, consisted of fibrous tissue, but on approaching the centre I found the structure materially changed. Instead of compact fibrous tissue, alveoli of variable size were seen, filled with flattened, angular and polygonal cells, devoid

of intercellular substance. Glandular tissue was absent.

From the above observation I diagnosed cysto-sarcoma mammae, fibroma and schirrhus. The cysto-sarcoma mammae is an uncommon production. But the circumscribed proliferation of its capsule, forming a fibroma, and this degenerating, at a point remote from its onset, into a formation of such preëminent malignancy as schirrhus is, I believe, one of our rarest pathological conformations. E. P. Brewer, M.D.

Norwich, Conn.

Sclerosis of the Stomach, Involving Stricture at the Pyloric Orifice.

Ed. Med. and Surg. Reporter:—

On account of the rarity of this pathological condition in the stomach, I thought it might not be uninteresting to the readers of the Reporter to notice the history of the following case, that recently occurred in my practice.

Case—David P., aged 72 years, called at my office in October, 1878. He complained of symptoms of indigestion, had a ravenous appetite, but taking food was frequently followed by nausea and vomiting. I prescribed a stomachic tonic, requesting the patient to call again in one week. I heard no more from him until April 19th, 1879, at which time I was called to see him. I learned that he had, for the previous six weeks, been under the treatment of a doctor who claims to cure cancers. I found the patient a mere skeleton, being unable to raise his head from his pillow, or to move his hand to his head. So emaciated had he become, that the bodies of the lumbar vertebræ could plainly be distinguished one from another, through the abdominal walls. He had, up to this time, had no pain whatever, the main symptoms being vomiting directly after eating. No blood was ever vomited, the ejecta consisting solely of unchanged food. The appetite had been good until a week previous to my call. Bowels obstinately constipated, from lack of the normal stimulus to peristalsis. The urinary bladder was found distended, and was voided with the catheter. This was continued every day, with no other treatment, until April 26th, when the patient died from inanition. Autopsy 36 hours after death. The stomach was found to be reduced to nearly one-half its normal capacity. Its tissues were in a state of fibrous degeneration, the whole organ being involved to some extent, the pyloric extremity extremely so, however. The pyloric orifice was contracted so as to admit only a fair-sized goose quill. The other organs were healthy. The condition found corroborated the diagnosis which was arrived at by exclusion.

Bethel, Vt. L. M. Greene, M.D.

False Joint Treated by Prof. Henry H. Smith's Method.

Ed. Med. and Surg. Reporter:—

I take the liberty of reporting this case as one more in the list of successful cases of false joint treated by Dr. Henry H. Smith's method (pressure and motion).

John Schiller, age 40, a farmer by occupation, has always enjoyed good health up till August the 10th, 1877. While threshing, his clothing became entangled in the shaft of the thresher, and being whirled around the revolving shaft, had both bones of his right leg fractured; the tibia at the junction of the middle with the lower third, and the fibula above, near the head of the bone. The leg was treated with side splints and extension for ten days, after which it was dressed in a starch bandage, which he continued to wear for six months without any union. I then obtained from E. Spellberger, of your city, one of "Smith's Artificial Limbs for Ununited Fracture," and applied it February the 25th, 1878, the patient being unable to walk at that time, but could walk fairly well soon after it was applied. I examined the limb a few days ago, and found both bones firmly united by bony union. He has continued to wear the apparatus for a little over a year, and has now laid it aside and walks well.

I think this method the most rational of any that I have seen, and have no doubt that experience will show it to be the most successful as well as the simplest of application.

T. Wertz, M.D.

Jasper, Indiana.

Small Elastic Bands as Surgical Appliances.

Ed. Med. and Surg. Reporter:—

A convenient and inexpensive surgical appliance will be found in the small elastic (pure rubber) bands, sold mostly by booksellers and stationers. A band one-sixteenth of an inch in thickness, three-fourths of an inch wide, and about three inches in length, doubled, stretched and put about the wrist joint, answers an admirable purpose as a tourniquet for amputation of any portion of the hand, especially where a small compress is placed under the rubber band and over the radial artery at the wrist.

A similar band could be used to good advantage in amputations of the foot, by placing it about the ankle joint or just above it. In amputations of the fingers or toes, a much smaller band will answer every purpose, so far as a bloodless operation is concerned.

I have used this method of bloodless operation in the amputation of a finger near the carpo-metacarpal joint, with the loss of scarcely a drop of blood. H. L. Getz, M.D.

Marshalltown, Iowa.

Diphtheria in Children.

Ed. Med. and Surg. Reporter:—

I noticed in the Reporter of May 3d a case of diphtheria, as reported by H. L. Getz, M.D., of Marshalltown, Iowa. What I wish to say is in reference to my experience in the treatment of this disease among nursing children, having passed through two epidemics during the last three years, and had many cases in mothers nursing their infants. I have never seen a case of true diphtheria in a child contracted through nursing, when allowed to continue the nursing during the treatment of the mother. In the case mentioned by the Doctor, had the child been kept

at the breast, and the proper treatment to the mother continued, the result would have been far more satisfactory. This is a very interesting subject, worthy of the attention of every thoughtful practitioner of medicine, and I should be pleased to hear the experience of many others on this question. J. N. Medbery, M.D.

Webster City, Iowa.

News and Miscellany.

Association of Medical Officers of American Institutions for Idiotic and Feeble-minded Persons.

The fourth annual session will be held at the Illinois Asylum for Feeble-minded Children (Dr. Charles T. Wilbur's), Lincoln, commencing Tuesday, May 27th, 1879, at 3 o'clock, P.M.

The following papers will be presented and discussed:—

1. "The Relation of Speech or Language to Idiocy" (second paper), Dr. H. B. Wilbur, Syracuse.
2. "Ten Months Training of a Hand," Dr. E. Seguin, New York.
3. "Report of a case of Internal Hydrocephalus," Dr. H. M. Knight, Lakeville, Conn.
4. "Juvenile Insanity," Dr. I. N. Kerlin, Media, Pa.
5. "Protection of Public Institutions against Accidental Fires," Dr. C. T. Wilbur, Lincoln, Ill.
5. "Concerning Causes of Idiocy," Dr. Geo. Brown Barre, Mass.

The following resolutions were adopted at the Syracuse meeting, June 6th, 1878:—

Offered by Dr. H. M. Knight, seconded by Dr. Doren.

"*Resolved*, That the Association at its annual meetings set apart a certain time for the making of clinical reports."

Offered by Dr. Seguin, seconded by Dr. Brown.

"*Resolved*, That each member of the Association shall report at the annual meeting, on the 'Causation of Idiocy,' so far as illustrated in cases received into the Institutions for the past year; and that the Secretary be requested to call for such statistics hereafter."

On motion of Dr. Kerlin, seconded by Dr. C. T. Wilbur, it was

"*Resolved*, That the order of business shall hereafter include verbal or written communications from the superintendents on, 1st, Status of the work before the people and the Legislatures. 2d, Development and progress of Institution. 3d. Improvements in school training and hospital care introduced during the year.

Isaac N. Kerlin, *Secretary.*

Disease Raging in the Caucasus.

Intelligence has been received at St. Petersburg, from Tiflis, that a disease has been raging with terrible mortality in ten villages in the Caucasus. A solemn procession of holy pictures has been held in the district Gori, and prayers offered for the preservation of the inhabitants.

Official List of Changes of Stations, and Duties of Medical Officers of the United States Marine Hospital Service—March 18th to May 5th, 1879, Inclusive.

Hebersmith, E., Surgeon. To proceed to San Francisco and relieve Surgeon C. N. Ellinwood. April 4th, 1879.

Ellinwood, C. N., Surgeon. When relieved by Surgeon E. Hebersmith, to proceed to New York and assume charge of the Service at that port. April 4th, 1879.

Bailhache, P. H., Surgeon. Detailed as a member of the National Board of Health, March 28th, 1879. Directed, in addition, to act as president of Board of Examiners. March 29th, 1879.

Vansant, John, Surgeon. Detailed as member of Board of Examiners. March 29th, 1879. On completion of this duty, to proceed to Boston and assume charge of the Service at that station. April 4th, 1879.

Miller, I. W., Surgeon. Detailed as Recorder, Board of Examiners. March 29th, 1879.

Long, W. H., Surgeon. To proceed to Chattanooga, Tenn., as inspector; on completion of this duty, to rejoin his station. March 17th, 1879.

Murray, R. D., Surgeon. On expiration of leave of absence, to proceed to Norfolk, Va., and relieve Surgeon Sawtelle. April 28th, 1879.

Sawtelle, H. W., Surgeon. Promoted Surgeon May 5th, 1879, vice Hamilton, promoted.

Doering, E. J., Surgeon. Promoted Surgeon, May 5th, 1879, to fill original vacancy.

Gassaway, J. M., Assistant Surgeon. To proceed to Cortland and Astoria, Oregon, as inspector; on completion of this duty, to rejoin his station. March 18th, 1879.

Godfrey, John, Assistant Surgeon. To proceed to Pensacola, Fla., as inspector; on completion of this duty, to rejoin his station. April 11th, 1879.

Goldsborough, C. B., Assistant Surgeon. To report to the General Superintendent, Life Saving Service, for special duty, physical examination of surfmen. March 22d, 1879. To report to Surgeon Bailhache for temporary duty at Baltimore. April 10th, 1879.

White, Robert, Jr., Assistant Surgeon. To proceed to San Francisco, and report to Captain G. W. Bailey, commanding U. S. Rev. Str. Rush, for duty as medical officer. April 26th, 1879.

Keyes, H. M., Assistant Surgeon. To Cincinnati, to relieve Surgeon Vansant. March 31st, 1879.

Glazier, W. C. W., Assistant Surgeon. To report to the General Superintendent Life Saving Service, for special duty, physical examination of surfmen. March 22d, 1879.

The following candidates having passed the required examination, were appointed Assistant Surgeons, May 5th, 1879: Charles L. Dana, of New York, assigned to temporary duty at New York City. Henry P. Cooke, of Virginia, to report for assignment to Surgeon Hutton, New Orleans. H. R. Carter, of Maryland, to report to Surgeon Vansant, Boston, for temporary duty. William H. Heath, of Pennsylvania, assigned to temporary duty in the office of the Surgeon General, Washington, D. C.

Physicians' Certificates of Insanity.

Judge Elcock, of this city, recently expressed from the bench some opinions on the legal character of physicians' certificates in insane cases, which excited considerable comment.

Judge Elcock said that the legal doctrine has been well settled in this court, by decisions of two of its judges, that although unsoundness may exist, it implies no right to incarcerate or deprive the sufferer of liberty. The trial by jury applies as well to persons whose soundness of mind is attacked as to other cases. The practice of incarcerating a person on a certificate of two physicians was never intended to give an asylum the right to hold and deprive the person of liberty, but was intended merely as a justification for such institution to receive such persons. This case exhibits the popular fault of allowing physicians to pass upon questions of insanity as experts. Their evidence is worth no more than the evidence of persons in the ordinary walks of life, and the doctrine of their being experts in the question of insanity has been exploded. The evidence of insanity is to be gathered from persons surrounding those charged with being insane, who have experienced the knowledge of their conduct and their action, and the mere expression of opinion by outsiders amounts to nothing.

Refrigeration as a Means of Disinfection.

At a recent meeting, the National Board of Health addressed a letter to Secretary Thompson, asking the advice and co-operation of the Navy Department in carrying into execution the act approved April 18, 1879, providing for the construction of a refrigerating and disinfecting ship. The question as to what particular kind of ship or refrigerating apparatus is best adapted to attain the objects aimed at by the bill is one which, in the opinion of the board, it is not competent to decide. It therefore requests the Secretary of the Navy to organize a special board or commission of naval experts and engineers, to whom all the plans and specifications can be referred, and who shall report as speedily as possible upon the subject. Secretary Thompson, in pursuance of this request, to-day designated the following Board of Naval officers to examine into and report upon the subject: Chief Engineer David Smith, Passed Assistant Engineer W. A. H. Allen, and Naval Constructor W. L. Mintony.

The Duty on Quinine.

The fortune of the late Mr. Thomas H. Powers is estimated between five and ten million dollars. Very much of this was made on quinine, and the movement to repeal the duty on that drug is one which should meet the approval of all unbiased physicians. At present the sick are obliged to pay more than twice as much for this medicine as they would were the duty removed. This excess goes into the pockets of the already enormously rich manufacturers. It is a striking instance of the gross injustice of protective duties. In fact, it is encouraging a monopoly of the most unfair description.

Items.

—Out of 421 cases of the plague in Wetlyanka and vicinity, which was the total number reported, 357 terminated fatally.

—The exodus of the colored population from Mississippi and Louisiana to Kansas and Missouri has resulted in a heavy mortality among them, by some observers estimated at 25 per cent. Moreover, it is feared that they will bring germs of yellow fever with them, and a stringent quarantine has been talked of.

OBITUARY NOTICES.

—Dr. Thomas J. Corson, of Trenton, N. J., died May 10th. He was a prominent citizen and at one time president of the State Medical Society. It was at his instigation, in the winter of 1878 that the investigation into the management of the State prison was gone into, he having preferred charges against Keeper Mott and Dr. Phillips, for cruelty to the convicts, which at the time created such widespread interest.

—At Port Jervis, N. Y., May 8, Dr. O. A. Carroll, of that place, a prominent member of the Orange County and the Tri-States Medical Society, died suddenly, of heart disease. He was 54 years of age.

—Dr. Robert J. Whitely, a well known physician of Paterson, died at his home in that city on Thursday, April 10th, from paralysis. Dr. Whitely was born in Paterson, but went to California in 1849, and remained there until 1854. He was a prominent Mason.

—Dr. Joseph P. Chandler, of Centreville, Delaware, died last week, at the age of 68 years. He was a graduate of the University of Pennsylvania, and for nearly 45 years had enjoyed an extensive practice.

MARRIAGES.

BUTTON—WODDROP.—On the 30th ult., in the Haines Street M. E. Church, Germantown, by the Rev. Joseph Welch, assisted by the Rev. John Winna, Mr. John Button, Jr., and Miss Anna S., daughter of R. S. Woddrop, M.D., all of Germantown, Philadelphia.

McCOLLOUGH—McCLENATHAN.—At the residence of the bride's parents, in Catlin, Vermillion Co., Ill., on Thursday, April 24th, 1879, by the Rev. Wm. R. Hendricks, A. M. F. McCollough, M.D., and Miss Emma A. McClenathan.

McCOSH—KELLOGG.— At Stewartsville, N. J., April 22d, by Rev. W. Thompson, assisted by Rev. W. Kelly, Samuel A. McCosh, M.D., and Louise W. Kellogg, all of Stewartsville.

SOPER—GARRABRANT.—In New York, on the 1st inst., by Rev. Dr. Potter, Oliver Soper, M.D., of Lodi, N. J., and Emma H., daughter of Peter S. Garrabrant, of Brookdale, N. J.

VERDI—MINTURN.—At New Brunswick, N. J., on Wednesday, April 30th, by the Right Rev. Horatio Southgate, D.D., Ciro S. Verdi, M.D., and Caroline, daughter of the late William H. Minturn.

DEATHS.

DOWNS.—On Friday, May 2d, 1879, in Brooklyn, at the residence of his nephew, No. 100 16th Street., Henry S. Downs, M.D., aged 67 years and 29 days.

FARWELL.—In Brooklyn, on Sunday, 4th inst., Darius G. Farwell, M.D., of consumption, aged 48 years.

WALNUT HILL,

HARTFORD, CONN.

CHARTERED IN 1874.

An Asylum Home for the treatment of *Inebriates* and *Opium Cases.*

Admirably situated, with ample legal powers of control; based on the fact, confirmed by science and experience, that *Inebriety* is both a physical and mental disease, curable as other diseases are, requiring special treatment in asylums, and in all cases relieved and benefited.

A limited number of patients received, and special facilities provided for each case. The objects sought are rest and building up the diseased organism. Among the means employed are, Turkish baths, electricity, tonics, lectures, amusements, and mental diversion, with exact military and hygienic surroundings. For further information address

T. D. CROTHERS, M. D., Superintendent,
1142-1182eow Walnut Hill, Hartford, Conn.

SYRUP-GLYCEROLE
OF
FERROUS CHLORIDE.

The Combination which all Forms of Iron must assume before Assimilation.

Superior to all other Iron Salts, in that, while it is readily taken into the circulation, and does referruginate the blood, it does not ordinarily cause constipation nor headache. It is very pleasant to the taste, and is unalterable.

Ferrous Chloride is a neutral salt, consequently it has no action upon the teeth, and may be administered fearlessly. This fact and the delightful taste of my preparation render it an advantageous form for administration to children. Each fluid drachm contains one grain of Ferrous Chloride, which, owing to the certainty of its assimilation, is a full, active, adult dose.

McKELWAY, APOTHECARY,
Successor to O. S. HUBBELL.
1410 CHESTNUT ST., PHILADELPHIA.

LAWTON'S
ABSORBENT COTTON

FOR

HOSPITALS, DISPENSARIES, PHYSICIANS, DENTISTS, DRUGGISTS, PHOTOGRAPHERS, ETC., ETC.

The article furnished by us will be found superior to any other, on account of the facilities we possess for the manufacture, and the care taken at every step of the process.

Not only in general surgery, but especially in gynæcological practice, Absorbent Cotton has found great favor. It differs little from ordinary cotton in appearance, except in its uniformly fine quality and pure white color, freedom from all impurities — being entirely cleansed from oil, resin and all foreign matter.

The property of instantly absorbing liquids, its exquisite softness and great cheapness render it an invaluable substitute for Patent Lint, Charpie or Sponge.

We put up our Absorbent Cotton in neat and convenient packages, containing one pound, one-quarter pound, and two ounces.

A descriptive Circular will be forwarded on application. Samples containing two ounces will be sent, free of postage, on receipt of twenty cents.

PEPTONIC PILLS.

Pepsin, Pancreatin with Lacto-Phosphate of Lime and Lactic Acid.

(COPYRIGHT SECURED.)

This pill will give immediate relief in many forms of Dyspepsia and Indigestion, and will prove of permanent benefit in all cases of enfeebled digestion, produced from want of proper secretion of the Gastric Juice. By supplementing the action of the stomach, and rendering the food capable of assimilation, they enable the organ to recover its healthy tone, and thus permanent relief is afforded. One great advantage of the mode of preparation of these pills is the absence of sugar, which is present in all the ordinary Pepsin and Pancreatic compounds. In this form, the dose is much smaller, more pleasant to take, and is less apt to offend the already weak and irritable stomach. The results of their use have been so absolutely satisfactory, that we are confident further trial will secure for them the cordial approval of the Medical Profession and the favor of the general public.

Each pill contains one grain of pure PANCREATIN, which is equivalent to 10 grains of the ordinary or Saccharated usually prescribed and dispensed. Physicians will appreciate the great advantage of this mode of administration, the increased benefit to the dyspeptic being due to a full and effective dose of each, freed from unnecessary bulk, and really hurtful addition of sugar. A single pill will give immediate relief.

DIRECTIONS:—Take one pill immediately after eating or when suffering from Indigestion, Lump in the Throat or Flatulence. For children, reduce the pill to powder and give one-fourth or half, according to age.

A COMPOUND FRACTURE OF THE LEFT LEG, COMPLICATED WITH A FRACTURE OF THE BASE OF THE RIGHT RADIUS AND A LACERATION OF THE URETHRA.

BY J. S. WIGHT, M.D.,
Professor of Surgery at Long Island College Hospital.
(Reported for the Medical and Surgical Reporter.)

Gentlemen:—This patient has been injured by a falling bank of earth. His name is Mike Carey; he is forty-six years of age; he was born in Ireland; he is married; he is a laborer, and has just been brought to the hospital by the ambulance surgeon, to-day being the 25th of Feb., 1879. Let us gently and briefly examine this severely injured man.

First. You will observe that the left leg is injured about three inches above the ankle joint. There is deformity and a wound on the inner aspect of the leg. The deformity is due to a fracture of both bones; the upper ends of the lower fragments are displaced forward, and somewhat outward; the lower ends of the upper fragments are displaced backward, and somewhat inward; there is lateral displacement of the fragments, of about one inch; there is some anterior angular displacement; there is no perceptible rotary displacement, and the longitudinal displacement is very slight, because the fracture is nearly transverse. There is not much swelling, because the wound has permitted the escape of the extravasated fluids; in fact, the opening communicates indirectly with the ends of the fragments, so that there is a compound fracture. Let me direct your attention to the following points, namely:—

1. A small wound, in a case of compound fracture, may often be "closed up" in a few days, by putting over it some cotton wool. The cotton and the effused blood combine to make an impervious layer, which adheres closely to the integument around the wound. This layer should not be disturbed till the repair is complete, or till suppuration occurs, when the fracture will continue compound. Whenever it is possible, it is very desirable to convert, in this manner, a compound into a simple fracture.

2. Please to observe that I now flex the leg on the thigh, that I flex the foot on the leg, that I adduct the foot on the astragalus, that I make extension as my assistant makes counter-extension, and that the fragments are reduced easily and without pain. Splints of binder's board, that have been previously moulded and are well padded with cotton, are now applied to the leg and foot, and retained in place by a roller bandage. In this connection let me add a fact of importance: Elevate, or what is the same thing, extend the foot on the leg, so that the axis of the foot will make a little more than a right angle with the axis of the leg, for I have found this expedient useful in overcoming the tendency to anterior angular displacement. To flex the foot on the leg, so that its axis will more and more coincide with the axis of the leg, in my experience, has often contributed to the increase of the anterior angular displacement of the fragments of a broken leg. Also, let me note: The adduction of the foot on the leg will not be objectionable, for it will approximate the attachments of the gastrocnemius, soleus, anterior tibial and posterior tibial muscles. Hence one advantage of the paper boot in the treatment of fractures of the

leg, that it generally permits the adduction of the foot.

Second. Again, you will observe that the right forearm is injured about the wrist joint. In fact, the base of the radius is broken. Now, I have denominated all that part of the distal end of the radius which is more or less composed of cancellous tissues as the base of the radius. The average length of the base of the radius is about one and a quarter inches. There is more cancellous tissue on the posterior and external parts of the base of the radius than on the anterior and internal parts. It is through this cancellous tissue that the base of the radius is apt to be broken. The line of fracture may be transverse or oblique, from before, backward and upward. It is more generally transverse. In the present case the line of fracture is somewhat transverse, but, perhaps, a little dentate. The length of the distal fragment, as nearly as I can measure it, is about half an inch. This is not far from the average length of the distal fragment when the base of the radius is broken. I found the average length of this fragment, in eight cases of post-mortem examinations made by others, after recent fractures, to be $\frac{53}{100}$ of an inch. In the next place, let me carefully note the displacements of the fragments in this case before us:—

1. There is a bodily displacement of the distal fragment backward, to a distance of nearly its own thickness, when compared with the distal end of the proximal fragment. This is quite a marked lateral displacement backward.

2. There is also a slight outward lateral displacement of the distal fragment, say about one-eighth of an inch, when the distal end of the ulna is taken into account, for the transverse diameter of the injured wrist is about one-eighth of an inch greater than that of the uninjured wrist.

3. The distal end of the proximal fragment has a forward and inward displacement; it is flexed and pronated.

4. The distal fragment has a small inward angular displacement, the hand thereby falling somewhat outward.

5. The proximal fragment has a forward and inward angular displacement, more marked than the angular displacement of the distal fragment.

6. The distal fragment has a moderate backward rotary displacement.

7. The proximal fragment has a forward rotary displacement of considerable extent.

8. The longitudinal displacement of the radius is not very great, and appears to be due to the comminution of the ends of the fragments.

The question that arises is, How was the base of this radius broken? You know about the classical statement, that a blow on the palm of the hand, or on the anterior aspect of the wrist, will fracture the radius near the wrist joint. But this fracture was not caused in the classical way. Of this there is no evidence; but there is strong evidence in another direction. See, if you please, this considerable contusion over the posterior and outer surface of the carpus and the base of the radius. Did not this man raise his right hand to protect himself against the falling bank of earth, which severely injured another man, and crushed still another man to death? It is quite certain that he did. And then the force of the fall of the earth was transmitted obliquely through the osseous system, according to mechanical laws, and his left leg was thereby broken, as we have already seen and described. The base of the right radius was, therefore, broken by a blow, for it amounts to that, upon the dorsum of the corpus and base of the radius. The distal fragment was then displaced backward and outward by the supinator longus, the two radial extensors, and the extensors of the thumb. The proximal fragment was flexed by the pronator radii teres and the biceps brachii, and pronated by the two pronators, radii and quadratus.

And now, what shall we do with this injured forearm and broken radius? Give attention to the following points, namely:—

1. I have here a Palmer splint for the hand, the forearm, and the condyloid end of the arm; at the elbow it has a right angle, and an angle of about 140°; it is a double angled splint. Here is a dorsal splint for the hand and the forearm.

2. One assistant, who is instructed in the part he is to perform, takes hold of the hand of the patient, and makes careful and firm extension, as nearly in the axis of the normal forearm as possible; this tends to pull the distal fragment where it ought to be. Another assistant takes hold of the condyloid end of the arm, the forearm being flexed on the arm to a right angle, and makes counter-extension.

3. I now put the fingers of my left hand on the front and inside of the proximal fragment, having the thumb of the same hand on the dorsum of the ulna. Then I put the fingers of my right hand on the anterior aspect of the distal end of the ulna, having the thumb of the same hand on the dorsum of the distal fragment. The fragments of the base of the radius are now under control.

4. The extension and counter-extension will

overcome the longitudinal displacement, and liberate the ends of the fragments, so that, with my thumbs and fingers, I can push them, as far as possible, back to a position somewhat resembling the normal relation.

5. I lay great stress on this method of reduction, moulding, and coaptation of the fragments of broken bone, especially the base of the radius. It has enabled me, in the majority of cases, to obtain good results. It is a most valuable expedient. The fragments, as you see in this case, are quite readily reduced. Sometimes, when there is great impaction, you will find it impossible to make complete reduction of the fragments.

6. The limb is now gently laid upon the Palmer splint, a dorsal splint is applied to the hand and forearm, and the splints lightly retained in place by means of a bandage. The contusion on the back of the wrist will not bear much pressure.

7. In a day or two I will remove the dorsal splint, and make passive motion of the joints and the tendons, which can be done in such a manner as not to interfere with the condition of the fracture. Passive motion may be continued at frequent intervals, so as not to interfere with the process of repair.

8. In this case it will be competent for us to predict more or less deformity, and more or less loss of function, after the treatment.

9. A point of importance you may have your attention called to is, that the tendons of the extensors of the thumb are so closely connected with the distal fragment as to impair their function during the process of repair. In fact, at times there will be marked immobility of the thumb. The so called abductor of the thumb will not be injured, and yet the thumb cannot be abducted. You will notice, in the normal condition, that the thumb is abducted by the conjoint action of the extensors, the abductor and the opponens pollicis.

10. And you will find that the hand will fall to the radial side, as the treatment goes on, on account of muscular contraction, and on account of the necrosis and absorption of the ends of the fragments, as the broken surfaces press against each other. Once more, as the crushing force of the falling earth made an impact on the right forearm, and was transmitted obliquely through the osseous system to the left leg, it must have made tense a great many muscles of the body. Some of the muscles and some of the other soft structures may have been lacerated. In a case like this we ought not to forget the bladder and urethra. In fact, there is retention of urine. This may be due to shock, or it may be due to laceration of the bladder or the urethra. At any rate, let us make an examination. I pass a catheter into the urethra. The patient has never had stricture, yet the catheter will not go into the bladder, and it is all the same—the catheter does not go into the bladder—with or without a stylet. It is arrested somewhere. Let us see where. I introduce the catheter gently as far as it will go. I now feel in the perineum, and find a somewhat soft and semi-fluctuating swelling, which appears to be made up of extravasated blood and infiltrating urine. My finger is now inserted into the rectum. The catheter is only covered by the internal sphincter and the coats of the rectum. The instrument goes behind and beneath the prostate, instead of through it, as usual. There is a rupture of the urethra, and it is important for us to find the place of rupture, and put an instrument into the bladder. Over and over again, you see, I have tried to put almost every kind of catheter into the bladder, and have as often failed. The rent must be in the floor of the urethra. Hence, let us again search along the roof of the urethra, and perhaps we shall find the opening in the end of the proximal fragment. Here is a No. 6 flexible catheter, containing a stylet, the end of which I bend into a pretty large semicircle, and then extend about half an inch of the tip slightly backward. First. As the catheter goes in, at about the middle fibres of the accelerator, I feel the point ride over some tissue and go backward into the false opening between the prostate and the rectum. Second. I now withdraw the catheter, and put it into the urethra again, keeping the point, at the place of the rupture, somewhat nearer the roof of the urethra, when the opening in the distal end of the proximal fragment is penetrated by the tip of the catheter, which readily glides into the bladder. And now you will see bloody urine escaping into the urinal. Soon the urine runs quite free from blood. I will now fasten the catheter in the urethra and the bladder, and leave it there for some days, in order to prevent accumulation and infiltration of urine.

Some remarks of practical importance may be made in this connection, namely:—

1. This case, and others which I have seen, appear to show that the urethra may be ruptured by muscular contraction. Our patient has no signs of contusion; yet I do not put the matter strongly; I only say that his urethra appears to have been ruptured by muscular contraction.

2. It would not have been possible to have known that the catheter was outside of the urethra, if the finger had not been inserted into the rectum, for the mobility of the tissues was such as to permit the catheter to take a nearly normal direction. The instrument seemed to be in the right place and the right direction.

3. To have made any forcible effort to push the catheter into the bladder, as it seemed to be so nearly there, would have involved the greatest peril to the patient, for it could only have separated the tissues of the rectum from the bladder to a greater extent, and possibly have penetrated the peritoneum.

4. The putting the catheter into the bladder through a ruptured urethra demonstrates the feasibility of such a procedure. The work required patience, gentleness and perseverance, combined with the application of those rules I have often insisted on during the introduction of a catheter.

The following items in the progress of the case, and which were related to the class from time to time, may be enumerated, namely:—

1. The catheter was left in the bladder one week, when it caused great irritation and much pain. It was then removed, after which the patient passed his urine readily for about twenty-four hours, when retention came on, as at first; then the catheter was again introduced, in the same manner as before, but more easily, giving great relief from pain and irritation. At the end of another week the catheter was again removed, after which the patient readily evacuated his bladder for several days. Then another attack of retention was relieved by the application of warm fomentations over the bladder, and by the patient sitting up in bed to urinate. Subsequent to this date the catheter was not required.

2. The fracture of the leg has done well. A moderate degree of suppuration took place in the wound. The deeper tissues over the bone appeared to unite rapidly, a considerable superficial ulcer being left, which was dressed once or twice a day, with oakum laid under the internal splint. As often as the oakum became somewhat saturated with the waste products it was removed, and fresh oakum put in its place. No wash of any kind was used at any time—a perfectly dry dressing doing admirable work. Such a dressing has been faultless in an exsection of the ankle joint, and in capital amputations, in my practice. I recommend to you the dry dressing, as very desirable treatment in some cases.

3. The fracture of the base of the right radius has done as well as could be expected under the circumstances. The skin over the outer and posterior surface of the carpus and the base of the radius has broken through at some points, and suppurated; this has been dressed with dry cotton. The part has been able to sustain only slight pressure from splints. While the reduction and coaptation of the fragments at the outset were quite perfect, there has been absorption of the broken ends, and shortening of the radius, the hand falling outward. The adductor of the thumb is somewhat active; the flexors of the thumb are in good condition; and the extensors of the thumb are quite useless, being fastened into the new formation of the reparative process. Hence, the thumb cannot be voluntarily abducted and extended. This condition in this case is likely to be permanent, as I have seen in other cases, and as I recently found in a case of fracture of the base of the radius in the practice of other surgeons.

At the end of the third week the patient had a chill, accompanied by considerable swelling over and above the left Poupart's ligament. This swelling gradually subsided, when a considerable swelling appeared in and at the inner side of the left Scarpa's triangle. The patient had another chill about this time. The femoral swelling had been dressed with carbolized oil. The pus gradually approached the surface, and on the 31st of March it found its way out through an opening made by a curved bistoury through the tendons of the adductors of the thigh, just below their origins. After this, for a few days, the patient did not get along very well. But under cinchona and turpentine he greatly improved in appearance and condition, and on the 8th of April there was no reasonable doubt that the patient was on the road to a good recovery.

Communications.

THE ADVANTAGES OF THE COUNTRY PRACTITIONER IN THE STUDY OF CERTAIN DISEASES, AND HIS DUTY IN THIS CONNECTION.

BY GEORGE HAMILTON, M.D.,
Of Philadelphia.

Trousseau, in his chapter on typhoid fever, declares that its origin and development can only be determined by physicians who practice within restricted localities, where it can generally be ascertained who was first attacked by the disease. This remark may, with equal truth, be made in reference to several other maladies, especially scarlatina, dysentery, diphtheria and puerperal

fever. It not unfrequently happens that the village or country physician has under his immediate care every, or nearly every, family within certain limits; or it may be that one or two physicians encroach slightly upon the domain of his practice; so that in any event there can be little difficulty in discovering the place of origin of these diseases. The starting point of the malady being determined, its development and progress can readily be observed. Again, in reference to the contagious or non-contagious character of disease, Trousseau says (for, though dead he yet speaketh) that to the country physician we are chiefly indebted for the solution of this question. The isolation of families, and the rare occasions for personal contact of large numbers of people in the country, present most favorable conditions for solving this question, compared with the casual and uncertain opportunities afforded the practitioner in large cities. Here all is commotion, and hundreds or thousands are daily thrown in contact with each other in the streets, the public squares and cars, or in churches, theatres, hotels, halls, saloons, hospitals and many other places of frequent resort, so that at the end of each day it is almost impossible to know with whom we have been in close proximity or actual contact. It is also to be remembered that persons of the most heterogeneous condition, the refined and cleanly and the improvident and degraded, are often thrown together confusedly, so that the correctness of the view of Trousseau is fully established.

Acute disease, in the country especially, when epidemic, is generally of more active type than in the city, as is exemplified in dysentery, scarlet fever, diphtheria, inflammation, and in idiopathic fevers. The opportunities for the study of these affections, not only in their usual typical form, but when epidemic and of exceptional violence, are far more frequent than in the city, and hence one great advantage of the country over the city practitioner. A case of disease that is fairly typical is, in practice, of paramount value; yet, as an element in the study of abnormal physiology, it must give place to one of excessive force, whether manifested in the highest grade of arterial excitement, eventuating quickly in the destruction of tissue, or in the profound passive congestions of malignant intermittent, cholera asphyxia, or in the destructive epidemics of the fourteenth, fifteenth, and sixteenth centuries. It is in such cases that the antagonism or contrast between perfectly normal and intensely abnormal physiology is presented in its most vivid aspect; and if, as must be admitted, such cases are not of common occurrence, they are the most potent of all others in illustrating the extremes of healthy and morbid action, and the extremes of that morbid action, whether in the violence of arterial movement, or the still more deadly condition of profound passive congestion. A few cases of this character will serve to make a more decided, lasting, and instructive impression upon the mind of the physician than many in which the deviation from the normal condition is less decided.

But it is not alone in the maladies cited, or the points referred to, that the country physician enjoys special advantages in the study of abnormal physiology. Certain hereditary affections are met with more frequently, in proportion to population, than in cities. Of these, the more usual are pulmonary consumption, apoplexy, paralysis and mental disturbance. That this statement may not always find application, must be admitted, yet the observations of so many medical authorities, in this country and in Europe, in support of its general accuracy, cannot be disregarded. There is, in fact, no shadow of the improbable or irrational in the case, if we reflect how large the percentage of consanguineous marriage must, almost of necessity, be in rural districts. In regard to mental disorder, it is alleged that many sufferers will necessarily be found in the numerous institutions established for such patients, who have lived in the country, inasmuch as the population engaged in farming is very large; but, in addition, there are certain contributing causes to be found in the isolation of the people, their more solitary life, and the facility with which they can avoid society, and, retiring away from family or friends, abandon themselves to the gloomy and depressing thoughts that hold possession of the mind. As a school of practice the country presents decided advantages to the recent graduate. If his location be well chosen, he will generally find, in a very short time, something to do, and may, by the end of the second or third year, have a full round of practice, while in the city a period of from five to ten years is generally required before even a moderate patronage can be acquired. But again, the young city practitioner must generally spend many years in practice before he can secure the entire confidence of those who may employ him, and it often happens, upon the first symptom of danger, that a consultation is demanded with some one of the numerous and more experienced physicians; or, it may be the latter is requested to attend exclusively to the case. Occurrences of this kind, so discouraging

to the young practitioner, are, for obvious reasons, comparatively rare in the country, so that, thrown upon his own resources, the young practitioner soon becomes self-reliant, and thus are friends and patient inspired with a confidence that learning, experience and talent alone would fail to establish. In rural practice a rivalry frequently arises between two or more practitioners, and, as the late Professor Wm. Gibson, in his valedictory, once said, is at times characterized by an acrimony that rarely finds its parallel in the city. In this feeling the patrons on either side will participate, and as reports of every kind in rural sections fly with rapid wing, so will the success or the want of success of either party, in any case, be faithfully given to the winds. This state of affairs is, of course, neither pleasant nor commendable, yet finds its compensation in, if possible, closer attention and increased effort in behalf of the patient.

From what has been stated, it is evident that the country practitioner will, as a rule, have had during the first five or ten years a large amount of bedside experience, acquired, too, under favorable circumstances when compared with that of the city practitioner; yet he furnishes but little for publication, although he must be in possession of much more practical matter, acquired in the space of time referred to, than could be expected from one who, during the same years, has practiced in the city. In a large rural practice, where families are remote one from the other, much time is requisite for visits, and it may be admitted that the physical exhaustion resulting from such practice often begets an indisposition for writing. Nevertheless, time may still be found, and opportunity, to briefly, yet clearly, prepare such matter for publication. Certain cases only need be noted, those of exceptional interest, presenting facts of an indisputable character, having close relation to the question of the contagious or spontaneous origin of certain diseases, their development and mode of progression; or those in which abnormal physiology is displayed in extreme degree, whether in excess or defect of arterial excitement. If, as Trousseau,* with many other eminent writers, declares, the solution of some of the most disputed points, including contagion, in reference to certain maladies, is mainly within the power of the country practitioner, his duty in this connection is surely evident enough; let us hope its fulfillment may not be long deferred.

Hospital Reports.

JEFFERSON MEDICAL COLLEGE HOSPITAL.

SURGICAL CLINIC OF DR. JOHN H. BRINTON, MARCH 26, 1879.

REPORTED BY DR. H. M. M'LANAHAN.

Urethral Stricture—Lithotomy, Two Cases.

Gentlemen:—* * * * The next case I shall bring before you this morning is one of obstinate stricture of the urethra, demanding for its cure something more than the ordinary treatment by dilatation. The patient is a sailor, and has at various times contracted gonorrhœa. The result is a stricture, situated about three-quarters of an inch from the meatus, of a firm and resisting character. It is, in fact, so tight that I can scarcely pass any instrument through it; even the capillary whalebone bougie enters with difficulty. It is impossible for me to pass any of the exploring or acorn instruments, such as are used to detect the site and measure the exact length of the obstruction. Stricture at or near the meatus is by no means uncommon, and when it occurs as the result of a gonorrhœa, is extremely apt to be accompanied by a narrowing at some deeper part of the urethral canal. Such strictures present certain peculiarities. In the first place they are very obstinate, and but slightly amenable to treatment by dilatation. Then, too, the dilatation is painful, and when accomplished apparently to a successful degree, is apt to be followed by recontraction. If left to themselves, these narrowings often, I had almost said invariably, give rise sooner or later to considerable trouble. Irritation of the posterior portions of the canal results, not infrequently followed by vesical disturbances. These strictures must, therefore, be gotten rid of, and there is but one way to effect this, and that is by internal division. The patient before you is of very impressible temperament, and exceedingly intolerant of pain. I have, therefore, caused him to be etherized.

You will please notice what I do. In the first place, I insinuate through the opening of the stricture this small tenotome, and, as you see, I now divide the stricture freely in the direction of the floor of the urethra. I can feel the fibrous structures give way beneath my knife, and I draw the blade, not only once, but two or three times, through them, in order to effect a free division, so that when cicatrization occurs, it shall, as far as possible, take place without narrowing the urethral canal. I will now introduce this stretching instrument. It is the one constructed by my colleague, Dr. S. W. Gross, and has, I think, some advantages over the one devised by Sir Henry Thompson. The separation of the blades begins at the joint, at the very extremity of the instrument, and is effected with great power by the wheel in the handle. The scale on the handle is also well arranged, and can be easily read during the operation. It ranges from number eighteen to forty of the Charriere scale. The Thompson instrument is of smaller size, and applicable to tighter strictures. I have a high opinion of it also. I will now insert the instrument, and as I do so, I detect a stricture deeply

seated in the canal, almost four inches from the meatus. The instrument passes through it readily. By turning the wheel, I separate the blades, and as I withdraw it, I stretch the whole canal, especially that portion near the meatus, which I have already incised. There is some bleeding. The remaining instrumentation is simple, and consists in the introduction of Thompson's sounds, and you see that I can now readily run up the instruments until I have reached number twenty-seven. Here I stop.

I am satisfied with what I have accomplished. The urethral canal is freely open to the bladder, and all that remains to be done is to keep it so. This I shall do by the daily introduction of sounds, commencing in two or three days. I shall not insert any to-morrow, but shall allow the patient to recover from the shock which sometimes, indeed, very frequently, follows a manipulation even of so apparently simple a character as the one you have just witnessed. It is a mistake to attempt too much, or to tease and irritate a patient unnecessarily. I am satisfied that in these cases it is better to make haste slowly, and I am sure there is no part of the human economy which is at times more jealous of interference than the male urethra. In the vast majority of cases such as this you may escape all disastrous consequences; nevertheless, they do sometimes occur, and if you do much urethral surgery, you must sometimes expect to have trouble. The books teem with accounts of surgical calamities, and if you escape them you will owe something to good fortune, as well as to surgical skill. I shall, therefore, take every care of the patient. He will be put to bed, properly wrapped up, and you will observe how carefully I have protected him from cold while on the table. His lower extremities have been separately enveloped in blankets, and his body has been well covered. These may seem to you little matters, but I am satisfied that harm is sometimes caused by neglect of these very particulars. Never allow a patient to become chilled during an operation. Even in the simple introduction of a catheter this should be borne in mind. Sudden or prolonged depression of temperature, especially when a man is in a nervous state of mind, must be injurious. I am sure I have seen carelessness in this respect followed by evil results which might have been prevented.

When this man recovers from his anæsthetic condition I will direct a hypodermic injection of a quarter of a grain of morphia. He has already had ten grains of quinia this morning. His diet during the next day or so will be looked after. My experience has taught me that after urethral operations, especially if there be any shock, the stomach is indisposed to ordinary food. There is a tendency to nausea; even beef tea offends. I employ milk in small quantities, often repeated, so that the patient shall take at least three pints in the twenty-four hours. Generally, too, there is a craving for acid drinks, and lemonade will most often prove acceptable. Milk and lemonade would seem a strange combination, nevertheless, I have found such a diet to answer better than any other. In leaving the subject there is just one caution I would give you, and that is, always examine the urine before operating on the urethra, to see if any organic disease of the kidney be present. Bad consequences may happen even when there is no such complication, but they are much more liable to occur when renal disease exists.

Lateral Lithotomy—Two Cases.

I have now to bring before you two very serious cases, the one a little boy ten years of age, the other a man of fifty. In each of these cases there is a large vesical calculus, and upon each one I propose to perform the lateral operation for lithotomy, and I must say to you, gentlemen of the Jefferson class, that I esteem myself highly fortunate, not that I have these cases to show you, but that one so illustrious as Professor Gross has kindly consented to hold the staff for me. It will, I know, be a memory for me all my life.

This little boy, Willie ——, was born in this city and has lived here all his life. For two years he has suffered from all the symptoms of stone. He has had frequent micturition, which has greatly increased of late. His parents tell me he has not been able to hold his water for a longer period than half an hour, and that he is usually disturbed many times in a night. Then, too, the flow of his urine has often been suddenly arrested. Micturition is painful, and the urine is often tinged with blood. There is constant tenesmus, and the prolapsus of the anus is very marked. These symptoms alone would point to the presence of a calculus, but the absolute certainty of its existence I have already demonstrated to you at my last clinic. I then sounded the boy, using for that purpose a steel sound, and you may remember the distinct click elicited on the contact of the instrument with the stone. This became very much more distinct when I attached to the instrument the sounding board, by the aid of which the sound was so greatly increased as to be audible to every one in this large lecture room. The stone, then, is in the bladder, and must be removed. In a child of this age crushing or lithotrity is out of the question, and cutting for the stone or lithotomy is the proper surgical resort. I propose, therefore, for this case, to perform the single lateral operation, the one you have so often seen practiced in this arena and with which you are familiar. In boys the lateral operation is not very dangerous; indeed, it may be regarded as rather a successful operation than otherwise. Between the age of five and ten years not more than one in twenty-five or thirty dies. On the other hand, between the ages of thirty and forty one out of eight or ten perishes, and between forty and fifty, one out of five.

The danger of lithotomy would seem to increase with the age of the patient; and the immunity in boys probably depends on the sound condition of the kidneys, the bland character of the urine, and the well known high degree of vitality in the young. The anatomical relation of the parts, and the undeveloped state of the prostate gland, which in adult life and old age is so sensitive and so liable to take on inflammation, no doubt has important bearings on the results of lithotomy. Stones sometimes return, or rather fresh ones are developed. Of this I once met a notable example.

In 1874 I operated upon a little boy aged seven years, removing from his bladder a calculus weighing two drachms and thirty-five grains. A stone nearly as large, I had been informed, had been removed from him three years previously. Subsequently, another calculus formed, and in 1876 was removed from the bladder by my friend Dr. Hewson, at the Pennsylvania Hospital. Since then I have learned that the poor child was again troubled with the same symptoms, and that, in all probability, a fourth stone had formed. Such cases are, however, fortunately, rare.

I shall now perform the operation of left lateral lithotomy on the little boy before you. The anatomy of the parts to be divided I have endeavored to demonstrate to you on the blackboard.

[The operation was now performed and a large, rough, spiculated calculus was extracted from the bladder. The boy recovered from the effects of the operation and did well till the fourth day, when diarrhœa set in. This was soon checked by vegetable astringents and opiates. During the second week part of the urine came away through the urethra. Three weeks from the time of the operation the boy was discharged from the hospital, perfectly well. The stone weighed one ounce and fifteen grains, and on examination was found to be a phosphatic calculus, developed around a uric acid nucleus.]

I shall now bring before you another case of stone, and one of the gravest character. The calculus in this instance is of large size, and its removal will, I fear, be attended with great difficulty and with proportionate peril to the patient's life. This is the history of the case:—

James K., aged fifty, born in Ireland, now resides in New Jersey. He has suffered from more or less vesical trouble for nineteen years. In 1861 he was sounded for stone: the symptoms were marked, but at that time no calculus was discovered. The symptoms continued to increase, gradually becoming worse and worse, until 1869, when the bladder was again examined but with negative results. Since that time he has suffered greatly. Micturition has become more and more frequent, there is great straining, the rectum sympathizing to a marked degree, and there is prolapsus of the bowel. He is often obliged to rise from his bed thirty or forty times in a night. He has worked at his trade, which is that of a stone mason, but his health has become greatly impaired. For this trouble he entered the hospital a few days ago, and on examination of his bladder I detected a calculus of large size. On careful measurement with this lithotrite it was found to be three inches in diameter, and very hard. The irritation of bladder, prostate and rectum has been extreme. As instrumental urethral manipulation was badly borne, and as the size and hardness of the stone precluded lithotrity, I have determined to perform the operation of lateral lithotomy.

In all probability, during the operation it may become necessary to extend the incision over upon the right lobe of the prostate, in order to make sufficient room for the withdrawal of the calculus, should my estimate of its size prove correct. It will be better to do this than to use violence in its removal. In the event of the stone being too large to be taken through the perineal opening, I shall crush it in the bladder, with these powerful forceps which I show you, in which the crushing force is exerted by a screw in the handle.

[The single lateral operation was now performed by the lecturer. The bladder having been opened, Dr. Brinton continued]:—

I have now, gentlemen, my forceps on the stone in the bladder, and from the separation of the handles of the instrument you may form some idea of the enormous size of the calculus. It is so large that it is evidently impossible to withdraw it through the incision already made; I shall, therefore, with this probe-pointed bistoury, enlarge the cut, by dividing the right lobe of the prostate to some extent. But I now find that after repeated efforts I am still unable to extract the stone in its entirety; nothing, therefore, remains for me to do but to crush it in the bladder with the forceps I have shown you. This I shall now do (applying the forceps). You notice their action: As I turn the screw, the blades close on the stone and crush off its external layers. I can feel them yielding, and as they break off the forceps slip on the stone. I shall reapply them until the stone be reduced to such a size that its extraction becomes possible. This, after repeated trials, is accomplished, and you see the main portion of this immense calculus is being now withdrawn through the external wound. To do this some force has been necessary, but I have endeavored to guard the soft parts in every way, and to make the traction as gentle as I can. Carrying my finger through the wound into the bladder, I find the track filled with fragments from the cortical portion of the stone, of greater or less size. These I pick out, as far as possible, and then inject the bladder, through the wound, with a strong stream of water. This not only washes out the debris but acts also as a hæmostatic. The hemorrhage, however, has not been great. This operation has been so severe and so long that the patient must undoubtedly suffer considerable shock. The prognosis, therefore, is grave in the extreme. I shall have him freely stimulated, and under a proper opiate influence, and shall report the result to you at my next lecture.

[After being removed from the arena, the patient was freely stimulated, and full doses of opiates were administered. He was given milk and beef tea alternately, every two hours, but he gradually became weaker. On the evening of the 29th he died, apparently from exhaustion, three and one-half days after the operation. The aggregate weight of the stone, a phosphatic one on a uric acid nucleus, was four ounces and five drachms. As many small fragments were, however, entangled in the clots of blood, and lost, during the operation, it is probable that the weight of the stone, could it have been extracted entire, would have reached at least five ounces.

Post-mortem Examination.—Some congestion of the kidneys, but not to any marked degree. The bladder was contracted, and the walls much thickened. The mucous lining was congested and thrown into deep rugæ. This condition had evidently been due to the presence of the stone, which seemed to have lain in a sort

of sac. The incision in the bladder was clean cut, not ragged or torn. In this respect its condition, considering the great size of the stone removed, and the prolonged efforts necessary to do so, was most remarkable. The prostate gland was not torn or lacerated. The other viscera presented nothing abnormal. Death was, without doubt, due to gradual exhaustion.]

Medical Societies.

COLLEGE OF PHYSICIANS, PHILADELPHIA.

At the regular meeting in March, Dr. Wm. S. Forbes reported a case of

Ununited Fracture of the Tibia, of Twelve Years' Standing,

in which the patient retained a useful limb. He was exhibited, and the case described, as follows:—

He is a seaman, a captain's mate, thirty-six years of age, and in full health. He has an ununited fracture in the middle of the right tibia; there is no bone thrown out from the upper or lower fragment. The line of fracture is quite a transverse one, and there exists a short, dense, fibrous deposit between the two fragments, which holds them closely together, so that while there is an appearance of consolidation, yet there is motion between the fragments, to a limited extent. He can walk about with but a very slight limp, and with entire freedom from pain, having no support from splint or bandage, and rarely using a cane. He says that the only feeling of discomfort he experiences is that, after walking long, there is a feeling of something pulling at the outer side of his knee. On pointing out the locality, I found it to be over the superior articulation of the fibula with the tibia. In connection with this indication, I find that his fibula was not broken at the time of his accident, and that it serves as a splint to his broken and still ununited tibia. Manifestly the fibula assists to support his superincumbent structure, and hence the sensation of pulling at the upper tibio-fibular articulation.

The patient's accident happened twelve years ago. In a gale of wind, off the Delaware Capes, he was struck by the end of a broken rope, in the middle of his leg; the soft parts were cut to the bone, and the extremities protruded. Three days after his accident he entered the Pennsylvania Hospital, and remained there for fourteen months; he then left the hospital for the country, some twenty miles distant. He was wearing at this time tin splints around the leg, and moved about in a rolling chair.

Three years after the accident he laid aside his splints and got out of his chair, and after using a crutch for a short time, abandoned it, for a cane. A little over three years after his accident he went to sea as the mate of a vessel, and has never since been laid up or disabled in any way. The tibia is no larger and no smaller, apparently, than an ordinary healthy tibia. Just at the line of fracture, and a little above and a little below the line, the bone is covered by a dense, fibrous tissue, serving as a stay ligament to hold the fragments in apposition; this ligament is only around the false articulation, and performs the part of a dense capsular ligament to the two fragments of the tibia. It is made very tense when the patient stands on that leg or walks.

The occurrence of ununited fracture in this case cannot be satisfactorily accounted for. The man had no taint or vice of system. He had enjoyed, and has continued to enjoy, apparently, excellent health. His appetite was good, and he appropriated his food; and he received proper treatment at the hands of excellent surgeons. There seems to have existed in this man what Sir James Paget has heretofore observed, "A simple defect of formative power; a defect which cannot be explained, and which seems the more remarkable when we observe the many changes which may at a later time be effected, as if to diminish the evil of the want of union." No other one of his bones has ever been broken.

Dr. Addinell Hewson gave the College illustrations of the

Value of Teale's Method of Forced Dilatation of the Sphincter Vesicæ in Incontinence and Excessive Irritability of the Female Bladder.

He reported in all six cases, in considerable detail, of which the first three were as follows:—

Case 1.—The first was that of a lady, about thirty years of age, residing ten miles from Philadelphia, with whose medical history I had been somewhat familiar from her early childhood. Soon after her marriage she was so shamefully abused by her husband that her father had to take her home, and obtain a divorce for her. I then treated her for a severe vaginitis and endometritis. At the outset of this trouble (gonorrhœa), and before I saw her for it, she had had an attack of great irritability of the bladder, followed, as she described, by a discharge of "black gravel," which gave relief to the bladder symptoms. At my interview with her she also stated that she had always suffered very severely in coitus, and that such acts were constantly followed by bleeding from the vagina, and pain at subsequent micturition. On the occasion of my being called to treat her for the gonorrhœa, I made careful examinations, both digital, and with the speculum, and found both sets of labia much swollen, and the remnants of the hymen excessively tender, so that I had to proceed with great care and gentleness, to make the examinations perfectly. I thus detected prolapsus and retroflexion, as well as all the symptoms of vaginitis and endometritis. For these I used douches, with the douche bottle, and double catheter, and medicated sponge-tents, and had the satisfaction of leaving my patient in a short time, restored, or rather freed from these troubles, and I ceased to attend her regularly.

Several months later (viz., in October, 1875, when I saw her again), she seemed remarkably well, and had grown fleshy. She stated, however, that she had at times some trouble in her menses, and a vaginal examination then revealed slight retroflexion, but no induration or hypertrophy of the uterus. For this condition I introduced a whalebone, intra-uterine, stem pessary, which she wore with satisfaction for three

months, when it was removed. My next summons was in the afternoon of February 21, 1876, to her country home, where I found her suffering intense agony from inclination and inability to urinate. She then told me that she had been very well since I had last seen her, up to the last flux of her menses, which had come on while she was away from home, traveling for amusement; that the flow was then arrested on its second day by her being exposed to severe cold, and that since she had suffered much with lumbar pains, headache, constipation, and tenesmus; the last symptom always when at stool. She had also had a great deal of erethism, with itching and burning at the entrance of the vagina, for the relief of which she had felt compelled to scratch the parts very severely. At this time I found much tympany, with tenderness of the abdominal walls, and inability to move without her sufferings being greatly increased. Her bladder was evidently not much distended, and the introduction of the catheter removed not over half an ounce of high-colored urine—which I found free from blood or pus. The use of the catheter was effected without difficulty or delay, but caused the patient to scream with agony. The instrument was held tightly by the contractions of the sphincter, and after its withdrawal the old symptoms were as severe as ever.

An inspection then showed the usual button form of projection of the mucous membrane of the orifice of the urethra to be found in most cases of acute sphincterismus, with inflammation of the parts, and I considered the case a very fair one for Teale's treatment. I therefore proposed to the patient, as I had both Atlee's and Ellinger's uterine dilators, as well as a special dilator for the female urethra, in my satchel, to resort to Teale's treatment, after I should get her insensible to pain by the rapid breathing. To this she readily consented, as she was still suffering as much as before the catheter had been used, and as she was satisfied that no relief was to be expected from the catheterism alone. Her distress was, indeed, so great that I directed her to try the rapid breathing before she should attempt moving on the bed. This she did, and at the end of three minutes, by the watch, she was so relieved of her hyperæsthesia as to allow her to fix herself as I wished, viz., on her left side, close to the edge of the bed, that is, in the ordinary obstetrical position. When this breathing had produced so much *insensibility to pain* that she could only recognize the contact of my fingers while I was pinching her with my nails as hard as I could, I proceeded to make a thorough examination, and then attempted to introduce Weisse's urethral dilator; but owing to the fleshy state of the nates, I found it difficult to manipulate with so short an instrument. I therefore substituted for it Ellinger's uterine dilator. This I passed through the whole length of its blades into the bladder, without any difficulty or annoyance, the rapid breathing being steadily kept up all the time. I then slowly effected such dilatation as would allow me to pass my index finger between the blades, into the bladder, without causing any pain or bleeding.

This operation occupied about fifteen minutes, and during all this time she was free from pain, although, as she said, she knew I was constantly touching her. The dilatation so effected was followed by most complete relief, and she had no desire to micturate during the following half hour, while I was at the house.

No applications or dressings to the parts were ordered, and I left directions simply for care about her diet and her remaining in bed. The next day I received a letter from her father (who was a physician), saying, "My daughter was restless, and occasionally complained of pain, throughout last night, but appears to be considerably better to day." Since then she has never had any return of her bladder troubles, and her cure was undoubtedly the result of the forced dilatation.

Case 2.—The next case I shall report was that of a widow lady, to whom I was summoned, in the city, on the morning of February 22d, 1876. She had been under my care frequently before, for various troubles, essentially due to prolapsus. This, the prolapsus, was frequently attended by great irritability, and even by catarrh, of the bladder; it had never existed before, however, to any great extent. This time her sufferings with her bladder were such as to make her act and look like a maniac, and nothing could induce her to try the rapid breathing to lull them. I therefore proceeded to make a digital examination; this showed the uterus healthy and in its natural position, but the bladder, and especially its sphincter, excessively sensitive to the touch. I was now told for the first time, and that by the aid of the memory of her mother, that she had had more or less constantly this irritation—a fact which she had denied to me before—ever since the birth of the first of her six children, in a tedious labor, sixteen years before. She further stated that her urine had always, since then, been loaded with what proved to be phosphates.

These conditions having been determined to exist, I proceeded at once to employ Teale's method of dilatation, unaided by any means of producing insensibility. This required much more time than the other case, and occasioned, without doubt, most intense suffering to the patient, she making constant efforts to draw herself away from the instrument. These efforts were nugatory, however, for, anticipating them, I had passed the instrument (Ellinger's), without any warning, quickly into the bladder, and had secured it there by means of its catch, well slid down, so that every time an extra effort was made by her I had but to let go the instrument, and it was not disturbed. In this way I took over twenty minutes by the watch to make a dilatation such as would allow of my passing my index finger into the bladder while the dilator was there. I then desisted. There was no bleeding, and the patient expressed herself as entirely relieved of all inclination to be constantly passing her urine; but there was great tenderness along the line of the operation. To remove this, I applied some wet clay to the parts there, and directed its renewal after each attempt at micturition. These attempts were now not at all frequent, and were always attended with a free flow of urine. At the end of three days of this mode of treatment she was not disturbed at all

at night, and had not more than three or four calls to urinate during the day.

A vaginal examination made at the end of the tenth day, during all of which time the earth dressing had been applied, showed that there was no tenderness or thickening along the urethra, or at its orifice. Since then this patient has never had any signs of sphincterismus.

Case 3.—My third case of sphincterismus, that is, of those which occurred in the aforesaid period of twenty-four hours (viz., February 21-22, 1876), was that of a robust, healthy-looking lady, thirty-eight years of age, who had been married sixteen years without ever having conceived. She had consulted a prominent gynæcologist, six years after her marriage, as to the cause of her sterility. He pronounced it due to prolapsus and retroflexion, and to remedy these difficulties introduced a Meigs ring pessary. He allowed her to wear this for three years, without any vaginal examination. Then, when she complained of her bladder symptoms, and desired the removal of the pessary, he, having been all that time in attendance on her, told her for the first time that the instrument ought to have been removed within six months after its insertion. It was then removed, and shortly afterward she ceased to be his patient. Two years later she placed herself under my care, for vaginitis and irritability of the bladder, which she said had been disturbing her ever since the ring was introduced, or had been worn but a short time, at least. She said that she had ever since then been compelled to pass her urine two or three times during the night, and was always annoyed with the inclination when walking in the street.

The vaginitis then existing (that is, at the time of my first visiting her) was removed by injections and applications per speculum, which instrument revealed indurations and thickenings all around where the ring had been two years before. This was assigned, in my mind, as the cause of the irritability of the bladder, and topical applications were continued until this culminated, on the 22d, in an intense attack of irritability and of incontinence, which had originated three days before, in a tedious shopping expedition. When I saw her this time she was exhausted with her sufferings of the night before, and was willing to submit to any operation which could give her relief, but was positive against the induction of any form of insensibility, having been assured by many that she had a fatty heart, which would kill her under such circumstances. I used the Ellinger dilator at once, with the patient reclining on her left side, as one in labor. This I did very cautiously, first getting the blades of the instrument into the urethra, then waiting some minutes, on account of the violence of the spasm of the sphincter, I slowly approximated the handles, with the same precautions as in the other case, and thus made my dilatation a steady and forced, rather than a rapid one. It occupied me over half an hour. And when I got the dilatation complete, I left the instrument in its dilated state in the bladder until all resistance to it had ceased. I then withdrew it, after closing its blades, and my patient expressed herself as entirely relieved.

The reason of my caution was to avoid laceration, and in this I was successful. Before leaving the patient I directed the constant application of clay to the parts, but on my visit the next day I found that it had not been used, and that the patient had had some attacks of sphincterismus; these were, however, at more prolonged intervals of time than those immediately preceding the operation. I therefore determined to leave the case without any topical applications, and watch what progress it could so make. This progress was slow, but satisfactory; there were frequent intimations of recurrence of the irritability, but no positive paroxysm, and the single dilatation eventually wrought a dissipation of all the thickening of the tissues there. Frequent vaginal examinations made this very apparent, and proved the dissipation complete in a year's time. This was an exceedingly trying case for Teale's method. The patient had been brought up from childhood amid all sorts of quackery, and was ready to imagine herself the victim of any malady which the last comer might suggest as explanatory of her sufferings. If, therefore, the operation could not be a rapid one, and performed without suffering, it may be deservedly considered a perfect success. She has now had none of her old trouble for three years.

Of the procedure, he stated—

I have operated on all of my cases, save one, with the patient reclining on the left side, a position which I was long ago taught, in Dublin, to prefer to all others for such operations, even for the purpose of using the female catheter. Its advantages are, not only that the patient is freed from the annoyance of having to face her surgeon, but is prevented from seeing what is going on, and from having her person exposed in the least; and, as can be seen from any accurate anatomical drawing [Velpeau's plate of a vertical section of the female pelvic organs exhibited], the orifice of the urethra is much more accessible in that position than in any other. It looks back, and enters the tract of the canal at almost a right angle from behind forward; hence, when there has been much retraction provoked by changes of tissue, like those resulting from the frequent use of nitrate of silver, the orifice is most readily entered from behind. The entrance once effected in this manner, by an instrument, the latter can be readily and quickly glided along the passage by simply moving its handle or near extremity forward in the segment of a circle, provided that the curve of the instrument is looking backward.

This done, with Atlee's dilator, the slightest approximation of its handles secures it in the bladder, as a consequence of the inverted form of a cone which its blades make; whereas, with Ellinger's instrument the parallel relations of its blades make it always necessary to have some retaining power, like that of a sliding catch, to guard against its being displaced. With Weisse's instrument, when it can be readily used, as on a thin patient, the third blade presents a serious objection by pressing forward on the tissues in front of the urethra, if it has been inserted with that blade looking forward, as is necessary in the lateral decubitus, or backward, in the dorsal position, when it compels the lateral blades to press on those parts. These faults of Weisse's

instrument show the advantages to be gained by using the other dilators when inserted from behind, with the curves of their blades looking toward the sacrum; they, on being opened, move under or behind the arch of the pubis, and not only can do no harm by their pressure, but exert pressure at the points and in the directions needed.

After the reading of the preceding paper, Dr. William Goodell said—

I have performed the operation of forcible and rapid dilatation of the urethra some fifty times at least, and have so often by it cured bladder troubles of long standing, that I wish to add my testimony to that of Dr. Hewson as to its efficiency. The female urethra does not possess a true sphincter but, from the meatus urinarius exclusive to the neck of the bladder inclusive it is surrounded by a network of muscular fibres which firmly constringe it, and act the part of a powerful sphincter. It is the spasmodic or the organic contraction of this broad belt of fibres, that makes woman more liable than man to urinary disturbances.

While warmly advocating the operation of rapid dilatation of the urethra, I wish to point out certain risks attending it to which Dr. Hewson has not adverted. One is incontinence of urine. This result I have not thus far seen in any of my own cases, because I dilate simply to the extent of the girth of my index finger, which is of medium size, and no further. But I have twice met with it in cases operated upon by other physicians, and in each the thumb had been forced in. This experience has led me to think that there is danger in making the dilatation too great. The other risk is that of hemorrhage, either external, from the rent often made in the upper margin of the meatus, or internal—into the bladder—from the rupture of the tense and thin fold of mucous membrane often found at the neck of the bladder. I have several times met with the former, and have been obliged to use styptics. On one occasion I was compelled, in a pregnant woman, to close the rent by a metallic suture, passed deeply in, before I could check the bleeding. I have occasionally met with cases of internal bleeding, but although one of them lasted for three days, I have not found it needful to interfere by styptic injections.

I would further remark that in the selection of cases for dilatation it is important to distinguish between purely hysterical cases and cases in which there exists a real tonic contraction of the urethral muscular fibres. For while the operation almost always benefits the latter, it will sometimes increase the urinary troubles in the former.

Periscope.

The Mechanical Treatment of Spasmodic Dysmenorrhœa.

On this subject Dr. J. Matthews Duncan says, in a lecture published in the London *Medical Times and Gazette*—

Finally comes the mechanical treatment, and this treatment is very successful. I know no drug that can compare with this in its direct utility. I know very few treatments that are more decidedly useful than the treatment of dysmenorrhœa by mechanical means, and yet I recommend you, in the great majority of cases of dysmenorrhœa, not to resort to it. Dysmenorrhœa is a disease which occurs in virgins, and in them you will be most reluctant to use it. In married women who are sterile, you will be, on the other hand, easily induced to try the treatment, in the hope that you will not only cure the dysmenorrhœa, but also at the same time remove the sterility. In regard to the use of this treatment in virgins, I must say a few words in order to guide you as to when you are to resort to it. No rules that I can give you will make up for want of good sense and good feeling on your own part, but I shall give you some hints. The first is that you should, as a rule, not resort to this treatment in an unmarried young woman without the concurrence of three parties—firstly, your own approval; secondly, that of the mother or guardian of the patient; and thirdly, that of the patient herself. All of these should be quite aware of the circumstances, and of what it is proposed to do. Then I believe you are justified in recommending it in cases—and they are not rare—where the woman's whole mode of subsistence is ruined. In one of the cases we had in "Martha," the patient insisted upon our doing anything whatever that was at all likely to relieve her, because she could not keep her situation as lady's maid, for she was confined to bed for three days every month by the disease. That was a sufficient reason in that case; and I can tell you that that girl was cured after a few days' treatment in "Martha," and came back to us to testify her gratitude for being able to keep her place, going about during her monthly period without letting her mistress know she was ill at all. Then, in other cases, the general health is ruined; and this is not very uncommon. When a woman is laid up and prostrated by a severe attack of dysmenorrhœa every four weeks, her health may gradually give way, and under such circumstances there can be no hesitation in resorting to the treatment. There is another set of cases where the severity of the pain is so excessive as to leave no doubt as to the propriety of resorting to any means that offer a hope of cure; and cases of this kind, although rare, are still such as you will all meet with in the course of your practice. In some cases the severity is not so much in the pain as in accompanying phenomena. Lately, for instance, I had no hesitation in recommending mechanical treatment in a young

unmarried female, not because the pain was extreme, but because when the pain came she had attacks of suicidal mania; and these attacks of suicidal mania were severe when the dysmenorrhœa was severe, and if the dysmenorrhœa was slight they did not come at all. Under such circumstances no one would hesitate to recommend the mechanical treatment.

Now, the mechanical treatment is very simple, if carried on by the oldest of all mechanical plans recommended for the treatment of this disease—that by bougies, such as I show you here. The treatment by bougies I recommend to you because it is unaccompanied by danger. The only evil result I have ever seen from it is a temporary perimetritis. It is a treatment the innocence of which arises from the fact that there is no cutting, and that the instrument is not left in the womb above a few minutes at a time. It is allowed to remain till the pangs of pain which it brings on have passed. In order to effect a cure you must go up considerably above a No. 9. You must go up so as to stretch and distend the internal os uteri; and this stretching or distention of the internal os may require you, in different cases, to reach different sizes. A No. 11 is quite sufficient in many cases; in others you will go up to a 12 or 13, rarely above that. These various numbers are not all used in one day, but in successive days, or every second or third day, and generally the whole is effected in a few sittings—say from four to eight. You are not to expect that this treatment will cure every case. I can only tell you that most of the characteristic cases are, if not cured, at least greatly ameliorated. In several cases which have passed through "Martha" we have had failures, and we have had an ordinary amount of success. In one of them the success was remarkable; a single passage of the bougie through the internal os uteri seemed to be enough to dispel the woman's disease.

Atropia in Whooping Cough.

Dr. Arthur Wiglesworth writes to the *Lancet*—

Without at the present time claiming for atropia the name "specific" for whooping cough, I am nevertheless constrained to say that in my hands it has advanced nearer to that position than any other remedy that I have either used or seen administered by others; and that so far it has been an unexpected and unequivocal success. I was led to try atropia by reading Trousseau's remarks concerning the ofttimes beneficial results obtained from belladonna; for it appeared to me that if the experimental treatment was to be carefully pursued, more reliable preparations than the extract or the powder of belladonna ought to be used. And the alkaloid seemed to be more likely to prove useful, first, because of its unvarying strength; secondly, because the dose could be more easily regulated in consequence; thirdly, because it is nearly tasteless. I therefore chose the solution of the sulphate of atropia (B.P.), which contains $\frac{1}{120}$ of a grain in each minim—a most convenient strength; and in every case directed that it should be administered in the morning, fasting. Also, whenever it could possibly be accomplished, I directed that the number of paroxysms should be carefully noted from 8 A.M. to 8 P.M. In this I departed from Trousseau's recommendation that the number of paroxysms should be noted for twenty-four hours; because it is practically useless to attempt to get trustworthy statistics during the night, except in those very severe cases where the attendance of a night nurse is imperative; and, further, if we find that there is either an increase or a diminution during the day, we may feel quite sure that the same ratio will exist during the night.

I commenced, then, over four years ago, to treat all cases of whooping cough solely with the solution of sulphate of atropia, from infants two months old to the adult. It required some little time to find out the average dose to begin with; but I now begin with $\frac{1}{120}$ of a grain (or one minim in a drachm of water), in children from one to four years of age, either diminishing or increasing the dose as occasion dictates; and, except in very severe cases, only order it to be given once a day; but when the nightly paroxysms are very severe, I order half the dose to be repeated about an hour before bedtime.

The results that follow its administration may be summed up thus:—1st. There is a steady diminution in the *number* of paroxysms. 2d. There is a diminution in the *duration* of the paroxysms. 3d. There is a change in the character of the "whoop," as if the vocal cords were not so closely approximated. Further, if the atropine is withheld, the beneficial effects derived from it subside.

Salicin and its Derivatives.

In the last (eighth) volume of the St. Thomas' *Hospital Report* there are three papers on the use of salicin, salicylic acid and salicylate of soda. Dr. Sharkey believes the last to be much more effectual than the other two. The dose given was 20 grains every two or three hours. Out of 150 cases of acute rheumatism treated by Dr. Jacob by salicylate of soda, a markedly good effect was noticed in 103 cases, 42 could hardly be said to be benefited or the reverse, and in 5 cases the effect was unfavorable. In no instance was delirium caused by the drug, although a sort of nervous irritability, restlessness, and rapid breathing appeared occasionally to be due to it. Dr. Theodore Acland, in an excellent communication on the same subject, states that the quantity of urine is diminished directly or indirectly by the drug, that the percentage amount of urea excreted remains unaffected, but that, of course, the total quantity of urea excreted is considerably lessened. This fact, in his opinion, explains the failure of the salicylic treatment in enteric fever.

To the *Transactions* of the Bristol (England) Medico-chirurgical Society, Dr. Spencer has contributed an exhaustive memoir on the chemical and therapeutical differences between salicin and salicylic acid. He combats the theory of Senator, of Berlin, who tried to show that salicin, as soon as it enters the stomach, breaks up and yields glucose and saligenin, and that the latter is oxidized into salicylic acid. He adduces several cases as clinical evidence justifying his skepticism of Senator's oxidation process.

Reviews and Book Notices.

NOTES ON CURRENT MEDICAL LITERATURE.

——A lecture on the Hygiene of Suburban Life, delivered by Dr. Roberts Bartholow in Cincinnati, has been published in pamphlet form in this city. It is instructive and pleasant reading.

——Dr. Max Landesberg, of this city, has published a paper on jaborandi and pilocarpine in eye diseases. He says: In regard to the myotic qualities, I must claim the great superiority of eserine to pilocarpine. The former has proved in my experiments to be a more powerful and more efficacious remedy than pilocarpine, and its use is attended either by very slight or no inconvenience to the patient, whereas pilocarpine possesses the very disagreeable properties of increasing the action of the lachrymal gland and producing ptyalism, if absorbed by the blood.

——Dr. Israel Michel Babbinowicz, of Paris, who some time ago prepared an excellent translation of the tractatus *Baba Kama* of the Babylonian Talmud, is preparing a work on the medicine of the Talmud. We possess already a similar work, by Herr Wunderbar, published in 1842, which, however, cannot be considered as complete, since the author is not a medical student. Dr. Rabbinowicz is both an excellent Talmudical scholar and a Doctor of Medicine of the Faculty of Paris.

——In a paper read before the Kentucky State Medical Society, and printed in pamphlet form, Dr. John A. Larrabee, of Louisville, gives a very instructive discussion of acute rheumatism in childhood. What he says about serious cardiac mischief following quite light attacks is of great importance. He strongly and justly urges that the arthritis present bears no relation to the possible extent of cardiac mischief. Of treatment, he observes: "Should pericardial, myocardial or endocardial inflammation occur, or as has been seen, should any one of these conditions usher in the disease, much good may be accomplished by prompt and energetic treatment. Blisters, or in the very young, rubefacients, are to be applied over the cardia or precordia. I have found great good from a linseed meal poultice, sprinkled with a little mustard flour, in such case, pain being relieved at the heart."

BOOK NOTICES.

A Guide to Therapeutics and Materia Medica. By Robert Farquharson, M.D., Edin., etc. Second American edition, revised by the author. Enlarged and adapted to the U. S. Pharmacopeia, by Frank Woodbury, M.D., Phila. H. C. Lea, 1879. 8vo, cloth, pp. 498.

The early appearance of a second edition of Dr. Farquharson's work bears sufficient testimony to the appreciation of it by American readers. The plan is such as to bring the characters and actions of drugs to the eye and the mind with much clearness. The physiological and therapeutical actions are arranged in parallel columns, brief notices of a chemical and pharmaceutical character are inserted, various prescriptions given to illustrate combinations, and paragraphs on modes of administration, poisoning, tests, antidotes, officinal preparations, elimination, properties, etc., are appended.

The care with which both author and editor have done their work is conspicuous on every page.

The Laws of Therapeutics; or, the Science and Art of Medicine. By Joseph Kidd, M.D. Phila., Lindsay & Blakiston. 8vo., pp. 197. Cloth. Price $1.00.

The author of this work is a fashionable London physician of extensive practice, but hitherto not known as an author, nor as a contributor to medical science in any of its branches. Indeed, though not quite irregular, he is eyed with suspicion by the London profession, on account of a supposed leaning toward the exclusion of Hahnemannism. In this book he disavows any such exclusion; he speaks with contempt of potencies and dynamization; and he looks upon the later doctrines of the founder of the exclusive school of homœopathy as senile vagaries. But he believes in the "law of the similars" as one of the most potent laws of therapeutics; he defends the value of "provings" on the healthy subject; and he claims that therapeutics has this and other definite laws (not this one exclusively), which are rational guides for the physician, and are bound to become more and more distinctly and universally recognized as such as the study of medicine advances.

Such are the general scope and aim of the book; it is one highly suggestive and well worth thoughtful perusal. It is, on the other hand, open to much criticism for carelessness of statement and language. The style is unpolished and bald; the reports of cases are vaguely written and incomplete, and there are signs, either of haste, negligence or ignorance, we can hardly tell which, in many paragraphs.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	$5.00
Half-Yearly Compendium of Med. Science,	2.50
Reporter and Compendium, - - -	7.00
Physician's Daily Pocket Record, - -	1.50
Reporter and Pocket Record, - - -	6.25
Reporter, Comp. and Pocket Record, - -	8.25

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

D. G. BRINTON, M.D.,
115 South Seventh Street,
PHILADELPHIA, PA.

THE THIRTIETH MEETING OF THE AMERICAN MEDICAL ASSOCIATION.

The reader will have observed with satisfaction that the meeting of the American Medical Association, in Atlanta, was one which was every way creditable to those who participated in it. The Association has become a centre of medical activity, and around its meetings are grouped those of a number of other associations, all connected with the advance of science, the improvement of the physical condition of this country, the elevation of professional and general hygienic education, the enactment of enlightened sanitary laws, and similar aims. This is as it should be, and the results thus attained are inferior to none which could be attained. We regard this concentration of medical interests as the very highest purpose of the American Medical Association, and certainly never before was it so fully carried out as in this last meeting.

Thus we see at Atlanta the Convention of American Medical Colleges, the Association of American Medical Colleges, the Sanitary Association of the Mississippi Valley, the National Board of Health, the Association of American Medical Editors, all assembling for their deliberations at the same time and place as the national body and its numerous sections. The opportunity is given for all these more or less nearly allied bodies to consult and unite in carrying out their plans, to secure the coöperation which is necessary to bring about the best results, and to become acquainted with others who, though not associated with them, can and will aid in their pursuits.

The discussions of the Association were also more satisfactory than they have sometimes been. Although not entirely free from the acrimony which springs from jealousy, it is gratifying to note that the barren quarrels over personal and ethical subjects gave way before an expressed willingness on the one side to observe the rules of the Association and a greater liberality on the other side in the interpretation of such rules.

Perhaps the actual amount of original contributions to science was less than it should have been; it is probable that it was, and it is regretted that the sections were not better represented by their most energetic members. But after all, we attribute little weight to this criticism. There are so many and, let it be said, so much better avenues to the public ear than the annual and long delayed volume of *Transactions*, that we are annually surprised that this medium obtains so many good articles as it does.

The strictly scientific purposes of the Association are subordinate to the general ones, those connected with centralizing the force of the profession to act upon medical men as a mass, and upon the public as a whole, and in its separate commonwealths.

The beneficent influence which medical men can exert on their fellow beings can only be secured in its highest degree by combination and coöperation; and to obtain these in their most efficient form, such unions as we have just witnessed at Atlanta are the most certain means. Let us have more such; we cannot have too many.

Notes and Comments.

Is Much Bathing Healthful?

In these days, when there are so many hygienists advocating the daily bath, the colder the better, it is well to hear the other side, particularly when it is represented by no less a name than Professor Hebra. This eminent dermatologist maintains, in a recent article, that washes, baths, frictions, etc., are more injurious than useful to health, and that they afford no protection against any illness arising from chill. In the country, where people seldom bathe, sickness and death are less frequent than in towns; people who never take a bath in all their lives, and wash themselves only superficially, often reach a very old age.

The different applications of water produce inflammatory redness, nettle-rash, eczema, itching, furunculosis and other affections of the skin, which cause much pain, and whose cure requires months, and even years. These are now considered to be the injurious effects of water. Pimples and that disagreeable eczema marginatum, caused through the application of wet compresses, belong to the same class. Water irritates sickly more than healthy skin, and most affects those parts which are continually exposed to its action. Baths render the skin less able to resist the influences of cold and warmth.

Let us Have Truth.

A leading English paper says—

"Until Russian officialism learns to approach the regions of truth, neither St. Petersburg nor London will ever know the actual existing state of things respecting the plague, or any other epidemic, on the banks of the Volga or elsewhere in Russia. As to the Melikoff reports, they represent things as the St. Petersburg Government desires the world to see them, and not as they are. Perhaps a little light may be thrown on the murky 'official' statistics on Russian health when the English Medical Commissioners return and present the public with their report as to how they found matters in Wetlyanka, on the Volga, and in Southern Russia generally. Until then we must remain dependent on intelligence which is not to be trusted, for the sole reason that it emanates from official sources."

The appreciation of the benefits of truth telling about epidemics is hardly greater in this country than in Russia. The health boards of cities constantly suppress facts, for fear they will "hurt business," and we are ashamed to say many members of the profession support them in this mendacity.

The Size of the Brain.

M. Broca has been investigating the size of the brain in the two sexes. According to him, the brain of women, and consequently their intellectual faculties, are not only inferior to those of men, but the difference tends to increase with the progress of civilization. M. Gustave Lebon, writing on the same subject, remarks that if the relative inferiority of the brain of women of the present day is more marked than it was in the prehistoric period, the brain of men has also become inferior to that of their prehistoric ancestors. He states that the skulls found in the "Caverne de l'Homme Mort" (Lozère) measured, according to M. Broca himself, 1606 cubic centimeters in men, and 1507 in women, the difference being 100. In contemporary Parisians the male skull measures, on average, 1558 cubic centimeters, and the female skull 1337, the difference being 221. This difference of the human brain is not only confined to the sexes, but it increases between the inferior and superior races. In men and women of the same height M. Lebon says that the difference is 172 in favor of the male brain.

Chromic Acid in Affections of the Mouth.

Chemically pure chromic acid, according to Dr. Rousseau (*Le Progrés Medical*, March), is entirely harmless. He lauds its internal use, administered in periodic doses, in various forms of chronic fungus and ulcerated inflammations of the gums, in which it appears to act most beneficially. Dr. Magitot also considers that it is valuable in cases of dentary alveolar osteo-periostitis; he has failed, however, to record any cases of its failure, though he has published his successful results. Several other practitioners, however, who have made use of this remedy, have failed to obtain any results, nor is this surprising when it is considered how various are the causes which may give rise to this disease, and under what different aspects it makes its appearance.

Oleate of Zinc in Eczema.

Several English writers have lately advocated an ointment of oleate of zinc in eczema. It may advantageously be made into an ointment with *unguentum* petrolei, and by the addition of a drop of otto of roses to the ounce. It is soothing and healing in a marked degree.

Correspondence.

Case of Hydrophobia.

Ed. Med. and Surg. Reporter:—

April 29th, 1879, at midnight, I was called to see William Hammond, aged 16 years, occupation farmer. I found him sitting upon the side of the lounge, dressed. The patient said he had been ploughing the day before, but on getting up this morning complained of chilly sensation, with pains in his arm, extending to the shoulder and neck. He said when he attempted to swallow anything, whether fluid or solid, but more particularly fluid, he felt a choking sensation. He had been unable to eat anything since morning. He felt hungry, but could not make the effort to swallow. His pulse was 90, full and strong; temperature 100°; tongue slightly furred; breath offensive; mucous membrane of the fauces highly congested; saliva viscid. I had been informed by the messenger that came for me that the boy had been bitten on the back of the hand by a dog, about twenty-three weeks prior to my visit. No one supposed at the time that the dog was mad. The dog was killed within a day or two of the time the boy was bitten, without any perceptible symptoms of hydrophobia. On examination of the cicatrix, there was no swelling or redness during the course of the disease. The only pain complained of throughout the disease was along the course of the nerve from the cicatrix to the shoulder. One peculiarity in the case was the marked rapidity of the disease passing from one stage to another. The patient was laboring under the second or hydrophobic stage when I first saw him—great difficulty, I might say an utter impossibility, of swallowing any liquid. Those horrible sensations which accompany the effort of swallowing, or anything that recalls the idea of a fluid, seemed in his case to excite violent agitation and aversion. There was a marked feeling of suffocation or a sense of choking, which rendered every attempt to pass liquids over the root of the tongue not only impossible, but excited convulsive action in the muscles of the larynx, pharnyx and abdomen. The patient found some relief in walking rapidly through the room, which led me to believe that the lungs were not the seat of any great oppression (according to Dr. John Hunter). As regards treatment, I had no chance of bringing any medication to bear upon the case. After making known to the parents that it was a case of hydrophobia, progressing rapidly to the third and fatal stage, and that all we could hope from remedial agents would be but to palliate, or to make his pathway down to death more comfortable to him and less distressing to those around him, and even this course must be accomplished by inhalations of chloroform, or by hypodermic medication, they concluded to try the Stoy Remedy, procured it, and made an effort to give one dose; being a fluid preparation, he failed in the effort to swallow; it excited violent spasmodic action, which continued four hours, terminating in death from nervous exhaustion. Being engaged with a case of labor, I was prevented from being present in the last few hours of his existence, but it would have only been to witness one of the most terrible forms of disease the human system is heir to. From observation of this case I feel confident that in hydrophobia we have a specific blood poison which expends its force upon the nervous system, producing rapid exhaustion and fatal results. Our limited knowledge of the disease points us to excision and caustics, with a view of destroying the poison, as the only curative means in hydrophobia.

One word in regard to the Stoy Remedy, which is creating so much excitement in our locality at this time. Might not the credit attached to its curative effect be owing to a failure of introduction of virus in the system, in a majority of cases, by the clothing wiping the poison from the tooth of the animal at the time the wound was inflicted.

N. G. Thompson, M.D.
Brandywine Manor, Chester Co., Pa.

On Reporting Clinical Lectures.

Ed. Med. and Surg. Reporter:—

An article appeared in the *Hospital Gazette* (a medical journal published in New York city), of March 29th, 1879, which claimed to be a report of a lecture delivered by me before the class of Jefferson Medical College, on "Placenta Prævia, etc." I saw the article on April 12th, and immediately addressed a note to the editor, expressing my "surprise and disgust" at the publication, and "utterly disclaiming the authorship of such a lecture," and declaring that "some of the statements in this so called report were as absurd as they were false;" and I requested him to "do me the justice of publishing my disclaimer at once." I received a note from him, bearing date of April 23d, and offering "to correct any mistakes or inaccuracies that may have appeared in my lecture." I waited for more than a fortnight for some published statement, such as I had requested. As none appeared in the *Gazette*, I again wrote to the editor on May 12th, saying that "having disclaimed the authorship, I cannot assume the censorship" of said lecture, and I desired him to write to me whether he would publish my disclaimer as I requested, and asking him to "favor me with a prompt answer." Having now waited for nearly a fortnight for an answer from him, and having received none (though I sent postage stamp for his reply), I respectfully ask you to publish this letter, that I may not remain under the imputation of having uttered such doctrine as that with which I have been falsely credited by the *Hospital Gazette*.

Respectfully yours,
Ellerslie Wallace, M.D.,
Professor of Obstetrics and Diseases of Women and Children, in Jefferson Medical College.
Philadelphia, May 26th, 1879.

A Large Prize.

The Royal Belgian Academy of Medicine offers a prize of 5000 francs for the best essay on "The Elucidation of the History of the Diseases of the Nervous System, and principally of Epilepsy." The essay is to be written in French or Latin, and forwarded to the Secretary of the Academy, Brussels.

News and Miscellany.

Medical Society of Pennsylvania.

This body held its thirtieth annual session in the city of Chester, commencing Wednesday, May 21st, at 3 P.M.

The President, Dr. J. L. Stewart, of Erie, called the Society to order, and prayer was offered by Rev. Henry Brown.

Dr. Wm. B. Ulrich, on behalf of the Committee of Arrangements, presented the register, which was read by the Permanent Secretary.

Dr. Ulrich then delivered the address of welcome to the Society, and presented the programme as arranged for the sessions.

A number of invitations to visit places of interest were offered and accepted, with the thanks of the Society.

Dr. Allis, the Corresponding Secretary, read his report for the year, which included the report of the Censors for the fourth district, relative to the case of Dr. J. P. Seiler, of Dauphin Co. The Censors dismissed the appeal of Dr. Seiler, and confirmed the action of the Dauphin County Medical Society in his case.

In the report was a communication relative to the officers of the Columbia County Medical Society, in not taking action on a flagrant case of breach of the code of ethics, on the part of two members of that Society.

On motion, the case of Columbia County was referred to a special committee, to be appointed by the chair, who were to report at this session.

Dr. Charles T. Hunter, of Philadelphia, then read the Address in Surgery, on treatment of wounds by the various methods now in use by different surgeons; on the value of the carbolized animal ligatures and sutures, and the efficacy of soft gum drainage tubes, etc.

Some points in the address were commended by Dr. C. B. Nancrede, of Philadelphia.

On motion of Dr. Lee, the address was referred to the Committee on Publication, and the thanks of the Society were returned to Dr. Hunter.

The President announced as the Committee on Unfinished Business, Drs. A. Fricke, of Philadelphia, D. A. Hengst, of Pittsburg, and H. L. Orth, of Harrisburg.

As the Special Committee on Columbia County Medical Society, Drs. Andrew Nebinger, of Philadelphia; Traill Green, of Easton; A. Thayer, of Erie; A. H. Halberstadt, of Pottsville, and J. A. Murphy, of Wilkesbarre.

Dr. Wm. Goodell next read his paper, entitled "Spaying for some Diseases of the Menstrual Function."

He took the ground that in cases of abnormalities in menstruation, such as intractable dysmenorrhœa, or cases where this function was accompanied by mania, etc., the most appropriate treatment was the removal of the ovaries, or the production of a premature menopause. He quoted a number of cases with very satisfactory results, and compared statistics of operations, etc.

The paper was discussed by Drs. Albert H. Smith, of Philadelphia, T. J. Gallaher, of Pittsburg, and Ellwood Harvey, of Chester.

Dr. Goodell replied to these remarks, and accepted the suggestion of a change of the title to Removal of the Ovaries, etc.

The paper was referred to the Committee on Publication.

Dr. Isaac N. Kerlin, of Media, read a paper, entitled "Juvenile Insanity," in which he took the ground that in many instances children are the subjects of insanity, and require the appropriate treatment, rather than whippings and other punishment. He gave the details of many interesting cases which had come under his care in the Institution for Feeble-minded Children, of which he has the charge.

The paper was referred to the Committee on Publication.

The Society then adjourned to meet at 8 P.M.

At 8 P.M. the Society was called to order by the Vice President, Dr. J. T. Carpenter, of Pottsville. The President, Dr. J. L. Stewart, delivered the annual address.

On motion of Dr. Green, the thanks of the Society were returned to the President for his address, and a copy was requested for publication.

On motion of Dr. Ulrich, Dr. Cardeza, of Delaware, and the Rev. Dr. Robinson, of Chester, were invited to seats with the Society.

On motion of Dr. Dale, all the members of the Delaware County Medical Society not already delegates or permanent members were invited to seats.

The Society then adjourned until Thursday at 9 A.M.

THURSDAY, MAY 22D.

The President called the Society to order at 9 A.M. After prayer by the Rev. A. T. Dobson, a telegram from Drs. Rowan Clark, F. Ridgely Graham, and R. B. Mowry, delegates to the Presbyterian General Assembly, in session at Saratoga, was read, hoping that the Medical Society would have a pleasant and profitable meeting.

The telegram was ordered to be entered on the minutes.

The reports of the various county societies were called for, and several were presented and referred to the Committee on Publication.

On motion, those societies which did not report were allowed two weeks to present their reports to the Committee on Publication.

The Permanent Secretary then announced the following as constituting the Committee on Nominations:—

Adams Co., E. Melhorn; Allegheny, J. W. Neely; Beaver, S. A. Craig; Berks, L. DeB. Kuhn; Blair, C. H. Closson; Bradford, Lyman; Bucks, H. Kratz; Chester, Jacob Price; Cumberland, W. W. Dale; Dauphin, H. McGowan; Delaware, R. H. Milner; Erie, A. H. Thayer; Franklin, H. S. Wishart; Indiana, J. W. Hughes; Lancaster, T. M. Livingston; Luzerne, J. E. Bulkeley; Lycoming, Thos. Dr. R. L. Sibbet, of Carlisle, Chairman of the Committee on Medical Legislation, reported as follows:—

The Committee on Medical Legislation respectfully report, that a memorial, not unlike that printed in the *Transactions* of last year, was prepared and laid before the Legislature of our State, now in session, with the names of all the officers, permanent members and delegates at our last meeting attached to it as memorialists; and further, that a bill, as indicated in the report of last year, requiring the registration of all practitioners of medicine and surgery by the prothonotaries of the several counties of the State, has passed the Senate and is now waiting a third reading in the House of Representatives.

Should this bill become a law on our statute books, a new era of improvement will be opened before the profession. We will have access to valuable information, which cannot be otherwise obtained. We will become more fully identified with our profession, with the history of our State and of our several counties. Future generations will know who and how many are practicing medicine now, and we will know.

Should this bill, however, fail in the House of Representatives, or not receive the approval of the Governor, your committee would renew their request that the members of this Society, and of the several county societies here represented, commence registration immediately, under the present law, imperfect as it is. The act requires the prothonotary of each county to purchase a record book, which may be called the *Medical Register* of the county. He will not be unwilling to engage in this work, or to take care of the Register, as experience has shown in at least two counties of the State; for he is compensated for his labor. He will be supported by the court, and by the members of the bar, who understand the importance of registration in the selection of medical experts and witnesses, when grave offences have been committed. The Forms of Registration are not given in the law, and it is not likely they will be given in any future enactment, but your committee have supplied these in the report of 1877. They may be printed or written on the first page of the Register; and after the index one page may be given to each affiant, as has been done in the Medical Register of Cumberland County. This will give room for a notice of the removal of the practitioner from the county, or of his death, when that shall occur.

Your committee would further suggest and urge upon the leading members of the profession in each county the importance of making a beginning; and we submit the following, which may be signed and presented to the prothonotary, to encourage him to purchase the Register.

To the Prothonotary of ——— County, Pa.:—

We, the undersigned practitioners of medicine and surgery, in ——— County, agree to commence registration under the act of 1877, in accordance with the suggestions of the Medical Society of the State of Pa., and respectfully request that you procure a book of suitable size, at your earliest convenience, to be called the Medical Register of ——— County.

Signed, etc.

With regard to the resolution concerning compensation for medical experts in criminal courts, and the right of the witness to give or withhold an opinion in such courts, presented by the Lycoming County Medical Society, and referred to this Committee, we beg leave to state that it has not seemed proper to connect this subject with the simple question of registration. And the Chairman has hesitated, not only to prepare a separate bill, but to express an opinion on the subject, about which there is so great a diversity of sentiment in legal circles. It is to be hoped that some one conversant with the decisions of the courts in our own and other States will favor this Society with a paper covering the points presented in the resolution, that we may know how to proceed. All of which is respectfully submitted. R. L. Sibbet, *Chairman.*

On motion the report was accepted, referred to the Committee on Publication, and the Committee continued.

Drs. Green and Stewart spoke favorably of the action of the law in their counties.

Dr. Traill Green, of Easton, on behalf of Dr. Hiram Corson, read the report on female superintendents for female insane asylums, as follows:—

Report of the Committee appointed by this Society at its last meeting, held at Pittsburg last year, to memorialize the Legislature to enact laws, if any be needed, to authorize the employment by the trustees or managers of Hospitals under the control of the State to employ women medical superintendents for the female departments of said hospitals, and for hospitals to be erected for the accommodation of insane females.

The undersigned, members of the Committee, in pursuance of the duty assigned to them, caused a copy of "The report on the propriety of having an assistant female superintendent for the female department of every State hospital for the insane," which was presented to this Society at its last meeting, to be sent to every member of our Senate and House of Representatives, and to many other persons of influence throughout the State, just prior to the meeting of our Legislature last winter, in order that they might carefully examine the subject before they should become heavily pressed with other duties. We also prepared and placed in the hands of Hon. Wm. B. Roberts, Representative from Montgomery county, an able and conscientious man, and an earnest advocate for the legislation desired by us, the following memorial:—

To the Honorable, the Senate and House of Representatives of the Commonwealth of Pennsylvania, in General Assembly met:—

At the meeting of the Medical Society of the State of Pennsylvania, held in the city of Harrisburg, in May, 1877, "a Committee was appointed to report on the propriety of having a Female Medical Superintendent for the female department of every Hospital for the Insane under the control of the State." That Committee made report to the Society at its meeting, in the city of Pittsburg, in May last, and the Society, in view of the important truths and facts contained in

said report, appointed the undersigned a Committee to memorialize your honorable bodies to enact such laws as may be needed to carry into effect the reforms or changes in the management of the female insane which are suggested in that report and desired by your memorialists. Allow us, therefore, to call your attention to a few facts bearing on this subject.

1st. In all the Hospitals for the Insane in this State the two sexes are nearly equal in numbers, and are managed on one common plan, viz.: There is a Superintendent, who is also the physician of the Institution, to whom is confided the entire management of the large farm connected with the Hospital, as well as the medical treatment of the hundreds of insane patients entrusted to his keeping. To aid him, he appoints two male medical assistants, one of whom has charge of the males, the other of the females.

2d. Until within a very recent period there seemed to be no way to avoid thus placing under the care of male practitioners the hundreds of unfortunate females found in our hospitals; but fortunately the time has at last arrived when we have many female physicians, graduates of regularly established medical colleges, and of much experience in treating the diseases peculiar to the sex, who are eminently qualified to have the entire medical and moral care of our female insane.

3d. Even at the present time, the *management* of the female department (save the medical) is entirely in the care of women, and they have proved themselves as well fitted for these duties as are the males in the male wards. Why, then, should not the medical superintendency be confided to a female physician?

4th. There are many grave reasons, well known to physicians, and fully realized by women, why it is more proper to have female than male physicians in charge of the female insane; and these reasons had great influence in causing the Medical Society of the State to bring the subject before your honorable bodies.

5th. The ability of women to manage large numbers of insane or vicious and criminal females is conspicuous in the history of the "Indiana Prison and Reformatory for Women and Girls"—the only prison in the world in which the managers, superintendent and assistants are all women; and in "the history of the Reformatory Prison for Women," at Sherborn, Massachusetts, where more than four hundred and fifty females are under the care and management of a female superintendent, physician and attendants.

6th. Accompanying this memorial are copies of the report made to the State Medical Society by its Committee, which justifies us, as we believe, in asking from your honorable bodies such legislation as will make it obligatory on the Trustees of all Hospitals and Asylums for the treatment of female insane under control of the State to appoint a Female Physician, to be the Medical Superintendent of the Female Department of the Institution.

Hiram Corson, M.D., Montgomery county; E. A. Wood, M.D., Allegheny county; R. L. Sibbett, M.D., Cumberland county; A. Nebinger, M.D., Philadelphia; Traill Green, M.D., Northampton county; Benjamin Lee, M.D., Philadelphia.

We also prepared and gave to our representative the following "Bill," entitled

AN ACT *for the better regulation and treatment of the female insane in the Asylums and Hospitals of the Commonwealth of Pennsylvania.*

SECTION 1. *Be it enacted by the Senate and House of Representatives of the Commonwealth of Pennsylvania, in General Assembly met, and it is hereby enacted by the authority of the same:* That in all hospitals or asylums now built (or hereafter to be built), and under control of the State, and in which male and female insane patients are received for treatment, it shall be the duty of the trustees of said asylums or hospitals to appoint a female superintendent, who shall be a skillful physician and who shall reside in said asylum or hospital, and who shall have the entire medical control of said female inmates.

SEC. 2. That said female superintendent shall be appointed by said trustees for a term of not less than five years, and shall not be subject to removal within that term, except for infidelity to the trust reposed, or for incompetency.

SEC. 3. This Act shall take effect, as to asylums and hospitals already built, in one year from the date of its passage.

SEC. 4. That all acts and parts of acts inconsistent with the provisions of this Act, be and they are hereby repealed.

The legislative committee to which these documents were referred returned the bill to the House with "an affirmative recommendation," not one member dissenting. It was in due time passed finally by the Lower House, and sent to the Senate. Until that time it had met no opposition from without, but as soon as it was referred to the Judiciary Committee there was placed in the hands of the Senate Committee the following memorial—

"*To the Honorable Senate and House of Representatives of the Commonwealth of Pennsylvania.*

"The memorial of the undersigned members of the medical profession respectfully represents

"That they have learned, with surprise, of the introduction of a bill into the House of Representatives compelling the boards of trustees of the different State hospitals and asylums for the insane to appoint "female medical superintendents, who are to have entire control of the female patients," and thus be independent of the chief medical officers of those institutions. Believing, as they do, that having two superintendents, acting independently of each other, in these institutions, cannot but prove detrimental to their best interests and to the welfare of their patients, tending, as such arrangement must, to destroy harmonious action, proper discipline and good order, your memorialists trust that the bill referred to will not receive your favorable consideration. The views of your memorialists are fully confirmed by all practical experience in the management of these institutions during the last forty years, and much of the success which has attended them has resulted from a system directly in opposition to the principles of the bill under consideration.

"It is to be observed that the proposed law has no connection with the question of employing

assistant female physicians. No additional legislation is necessary to do this whenever and wherever it may be deemed desirable, that being simply a question of expediency, and fully under the control of the Board of Managers of these institutions."

The above memorial was signed first by the Author of Jurisprudence of Insanity, and then by surgeons and assistant surgeons, physicians and assistant physicians, consulting surgeons and consulting physicians, in-door physicians and out-door physicians from institutions in this city as follows: Blockley Hospital for the Insane, the superintendent and six assistants; Jefferson College, 6; Pennsylvania Hospital, 12; University of Pennsylvania, 3; German Hospital, 1; Orthopædic Hospital, 4; Jewish Foster Home, 1; Episcopal and Womans' Hospital, 3; Blockley Almshouse, 2; Children's Hospital, 2; Wills Hospital, 3; St. Mary's Hospital, 1; Presbyterian Hospital, 1. Many of these had so many titles that there was some difficulty in assigning them the proper place in this summary, but we have done our best, in order to show the influence which so many titled persons would be likely to have on the Senate Committee. But we must not neglect to say that, in addition to the above, there were the names of 19 untitled physicians, plain M.D.'s, several of whom we recognized as justly occupying a high place in the profession. Nor were these all. The name of the Philadelphia editor of the Boston *Medical and Surgical Journal* was found among the rest. We are thus particular to show the strong influence which was arrayed against our modest little bill, lest if we should fail of success this Society might believe that we had failed also in faithful performance of duty.

This memorial, brilliant with titles, united to personal representations by those who presented it, led the Committee, who had not yet received from the members who had our bill in charge any representation of our case, to report the bill to the Senate with a "negative recommendation."

Representative Roberts, who had so successfully carried the bill through the House, and those who in the Senate favored our memorial, but were ignorant of what had been so secretly laid before the Senate Committee which had the bill in charge, were greatly surprised at the result. They at once took measures to have the bill recommitted, in order that its friends should be heard. It was returned, and Robert Lamberton, Esq., Attorney at Law, a resident of Harrisburg, for many years a member of the Board of Trustees of the State Lunatic Hospital at Harrisburg, and still one of its most valuable members, and intimately conversant with all its workings and results, and, we may say, its needs, appeared before the Committee and made, as we are informed, a most exhaustive argument in favor of the bill. He also laid before the Committee the following preamble and resolution, passed by the Board of Trustees of the State Hospital for the Insane, at Harrisburg, at their meeting in January of the present year, when all the members were present, by a vote of eight yeas to one nay.

"WHEREAS, The State Medical Society, at its last meeting, held in Pittsburg in May last, appointed a committee to memorialize the Legislature to pass laws, if any be needed, to have a female medical superintendent, to have entire medical control and management of every female asylum or female department of every hospital for the insane under control of the State; therefore,

"*Resolved*, That we, the Trustees of the State Lunatic Hospital at Harrisburg, being deeply impressed with the propriety of the measure, and believing that many advantages would result to the female patients from the proposed change, do earnestly desire that the honorable Senators and Representatives will in their wisdom enact such laws as will enable the proposed measure to be carried into effect as soon as it can conveniently be done."

This appeal from eight out of nine of the Trustrees of the oldest hospital for the insane in the State, and located within view of the Capitol, in accord as it was, too, with the memorial of this Society, joined to the personal representations of one of the most efficient members of the Board of Trustees, could not be disregarded, and the Committee, when last heard from by us, had concluded to suspend judgment in the matter until another opportunity could be had by the opposition to offer their remonstrances. This was the point at which they had arrived last Saturday. We have not heard from them since.

It is well here to notice, that not a single word of remonstrance against the measures of reform sought for by this Society came from the people of this great Commonwealth, save only from Philadelphia; nor even from any of the managers of her great charities; nor from her thousands and hundreds of thousands of benevolent private citizens; but alone from a few surgeons and physicians, some of them members of this society.

HIRAM CORSON, *Chairman.*

(To be Continued.)

Cheap Doctors.

Doctors must be cheap in Austria. One of the Vienna medical papers says that a parish doctor was advertised for by one town, and in consideration of his services he was to receive the sum of 300 guldens, and his travelling expenses, etc., were to be provided for by an extra 150 guldens. The work was such as would require all his time, and yet this honorarium was enough to cause keen competition between two candidates. The value in our money of this magnificent revenue is about $200.00!

Statistics of Burial Alive.

One hundred and sixty-two authentic cases of living burial are put on record by the eminent French physician, Dr. Josat. The period of unconsciousness before burial, in these cases, lasted from two hours to forty-two. The causes of apparent death were these: syncope, hysteria, apoplexy, narcotism, concussion of brain, anæsthesia, lightning and drunkenness.

Personal.

—The Mutter lectures on surgical pathology, at the College of Physicians, this city, will be delivered May 27th and 30th, June 3d and 6th, by Dr. S. W. Gross, on Tumors of the Breast.

—The following have been elected officers of the County Medical Society, Trenton, N. J.:—President, Dr. William Green; Vice President, Dr. Charles Dunham; Secretary, Dr. William A. Clark; Treasurer, Charles P. Britton.

—Dr. L. P. Yandell, of Louisville, sailed for England on the "Bothnia," May 21st, to be gone during the summer months. Dr. Yandell goes in search of health, but will look after matters medical also.

—Mrs. Dr. Sawtelle, of San Francisco, was refused membership in the California State Medical Society, and in the last number of her "Medico-literary Journal" goes for Dr. H. Gibbons, Sr., to whom she attributes her rejection, in a way that vividly illustrates the vigor of a woman's tongue—and pen.

—A doctor is already Governor of Maine. Another, Dr. L. P. Blackburn, has been nominated for the Governor of Kentucky, and his election is assured. What is more gratifying, is that the position was tendered him not as a politician but as a physician, in recognition of his philanthropical labors among the yellow fever sufferers last summer.

Items.

—The mortality in London, last year, was at the rate of 22.8 per 1000. In the nineteen next largest cities of England it was 24.4 per 1000.

—The total number of medical men registered in Great Britain this year is 22,600. Just about 1000 a year are added to the list.

—The programme of the third International Congress on Hygiene, which is appointed to be held in Turin next year (1880), under the presidency of Professor Pacchiotti Giacinto, has just been issued.

—In Prussia there result from 100 marriages 460 children, while in France there are about 300. The number of births per 100 individuals of the total population is in Prussia 3.98, and only 2.55 in France. The annual excess of births over deaths per million inhabitants is 13,000 in Prussia, and 2400 in France. It results from the above figures that doubling the population requires in France nearly 170 years, while this is effected in Prussia in 42 years.

—Pigs infected with trichinæ have been found in Spain, and at one dinner where trichinous pork was consumed six out of twenty-eight guests died of trichinosis. The infected pigs were the product of the north of Spain. In Barcelona, such a panic has arisen that the consumption of pork has been almost entirely suspended. It is said that in Italy and Portugal the importation of bacon and pigs from the United States has been interdicted, in consequence of its having been discovered that they contain trichinæ.

—Statistics of suicide, in Europe, show that the Danes, through a series of years, have exhibited the largest average of self slaughter; while their neighbors of Norway, breathing a kindred climate, are only seventh on the list. The second place is held by France, in which the totals of such deaths fall short of 5000 annually—one-half due to hanging, one-fourth to drowning; but among women, in a majority of instances, through inhaling the fumes of charcoal. The Swiss rank next to the French, and after them the people of Baden, the Prussians, and the Austrians in succession. These last are followed by the Belgians, after whom come the English. The crime is a rare one in Spain, and not common in Italy; but the country in which it is most rare is Ireland.

OBITUARY NOTICES.

—Dr. Isaac Thomas, of West Chester, Pa., died May 18th, aged 83 years. He was the oldest practitioner in Chester Co., and for many years enjoyed an extensive practice and the respect and esteem of his fellow citizens. He had retired from active practice for a number of years.

—The death of the eminent Dr. Charles Murchison, L.L.D., F.R.S., of London, took place on the 24th of last month, suddenly, from heart disease. He is best known in this country from his work on "Diseases of the Liver." He was a most able clinical observer, and enjoyed an extensive practice.

—The widely known meteorologist, Dr. H. W. Dove, died in April, in Berlin, in his seventy-sixth year. He was the founder of the Meteorological Institute, of Berlin, and was also distinguished for his researches in optics and physics.

—Dr. Gubler, the distinguished Parisian Professor of Therapeutics, died, of cancer of the stomach and hæmatemesis, April 23d, in the fifty-eighth year of his age.

MARRIAGES.

AYCRIGG—CARRYL.—In Franklin, N. J., Tuesday, May 13, by the Rev. Marshall B. Smith, at the residence of her stepfather, Mr. J. W. Stitt, Lottie Buchanan, daughter of the late Nathan T. Carryl, of Franklin, to Dr. John B. Aycrigg, of Passaic.

DAVIS—RICHARDSON.—In Barre, Vt., May 1st, by Rev. J. F. Stone, assisted by Rev. L. Tenney, Eugene W. Davis, M.D., of Springfield, and Anna M. Richardson, of Leavenworth, Kansas.

PARK—HAVERSTICK.—On Wednesday, May 14, at the residence of the bride's parents, Millersburg, Pa., by the Rev. W. H. H. Snyder, of Harrisburg, Pa., John W. Park, M.D., and Miss Ida L. Haverstick.

WITMER—SUTTON.—On Thursday, April 10, at the residence of the bride's parents, by the Rev. J. O. Critchlow, Pastor of the First Baptist Church, Germantown, E. H. Witmer, M.D., of Neffsville, Lancaster Co., Pa., and Miss Ella L., daughter of Franklin Sutton, Esq., of Lancaster, Pa. No cards.

DEATHS.

THOMAS.—In West Chester, Pa., on the evening of the 16th inst., Isaac Thomas, M.D., in the 82d year of his age.

CORSON.—In Trenton, N. J., on the 10th inst., Thomas J. Corson, M.D., aged 51 years.

SYRUP-GLYCEROLE
OF
FERROUS CHLORIDE.

The Combination which all Forms of Iron must assume before Assimilation.

Superior to all other Iron Salts in that, while it is readily taken into the circulation, and does referruginate the blood, it does not ordinarily cause constipation nor headache. It is very pleasant to the taste, and is unalterable.

Ferrous Chloride is a neutral salt, consequently it has no action upon the teeth, and may be administered fearlessly. This fact and the delightful taste of my preparation render it an advantageous form for administration to children. Each fluid drachm contains one grain of Ferrous Chloride, which, owing to the certainty of its assimilation, is a full, active, adult dose.

REMARKS ON THE IMPORTANCE AND TREATMENT OF ANAL FISSURE.

Read before the Allegheny Co. Medical Society,

BY R. STANSBURY SUTTON, A.M., M.D.

Of all the diseases which affect the anus none is more frequent or more painful, and, it may be added, more insignificant as to appearances, than is fissure or irritable ulcer, located within the folds of the tissue lining the sphincter muscles.

In order to thoroughly appreciate this affection it is necessary to study the anatomy and physiology of the anus, or external opening at the inferior extremity of the rectum. It is a dilatable circular opening, surrounded by two flat bands of muscular fibre, one above the other, and respectively named the external and internal sphincter muscles. These muscles are lined or covered with cuticle from below, for the external sphincter, and with mucous membrane from above, for the internal sphincter. They are supplied with blood vessels and nerves.

The external sphincter is a circular or elliptical plane of muscular tissue surrounding the rectal outlet. In its length it measures from seven to ten centimeters. Just opposite the outlet its breadth is about two and a half centimeters. It is best understood as divisible into equal halves, each plane of fibres arising behind the outlet, from the tip of the coccyx, by a common tendon, and being inserted into the tendinous centre of the perineum in front. Its anterior surface is covered with skin, containing sebaceous follicles, and upon which hairs grow. Its posterior surface is in contact with the internal sphincter. When the muscle is at rest it closes the outlet; the skin covering it is thrown into folds radiating from the centre, and as the muscle distends the folds are effaced. The skin forming these folds or pouches gradually approaches in appearance mucous tissue as they approach the lower border of the internal sphincter. This common cuticle, however, terminates, and the mucous membrane begins, just within the anus, on a line precisely over the division between the external and internal sphincter. This line of union between skin and mucous membrane is white and easily detected. Its surgical importance was first announced by Mr. Hilton, in his lectures on "Rest and Pain." At this line the external sphincter ends and the internal sphincter begins.

The internal differs from the external sphincter entirely, in this, that the latter is purely a voluntary, while the former is purely an involuntary, muscle. It consists of an aggregation of the circular fibres of the intestine, strengthened by the longitudinal fibres, some of which pass around the lower border of the muscle and some distance up on its anterior surface. Its breadth is about one and a half centimeters, its thickness about five millimeters at its lower border, and thinner toward the upper border. It is lined or covered by mucous membrane, which, while the muscle is at rest, is thrown into longitudinal folds, which are effaced during defecation.

The external sphincter is supplied by the hemorrhoidal branch of the fourth sacral nerve.

The internal sphincter is supplied by filaments from the hypogastric plexus of the sympathetic, which also extends to the mucous membrane covering the muscle.

The vessels of the anus are small, and consist of the terminal branches of the hemorrhoidal arteries. The veins are tortuous and plexiform, and are the inferior radicles of the venæ portæ. To complete the anatomy of the rectal outlet, we must add that the middle fibres of the levator ani muscle descend from the lateral walls of the pelvis, attach themselves to the sides of the rectum, and continue downward to blend with the fibres of the sphincter muscles, while the anterior fibres continue downward in the male, to be inserted into the external sphincter, and in the female they are inserted into the vagina. The office of the anal sphincter may be briefly stated to be to narrow the outlet; that of this portion of the levator ani to be to shorten the rectum, as they pull back the sphincters after the expulsion of the contents of the rectum. The muscles which antagonize those muscles described are the diaphragm and those forming the walls of the abdomen. That we may better appreciate the practical portion of our subject, let us consider further the nerves found in these muscles and their physiological action. As stated, we have both branches from the cerebro-spinal system and sympathetic system distributed to the sphincters.

But furthermore, the ganglion of the sympathetic supplying the internal sphincter is reinforced by a motor and sensitive filament from the cerebro-spinal system.

Again (we quote from Dalton), "the great sympathetic is endowed both with sensibility and the power of exciting motion."

If now we add the law of reflex action, viz: "that it originates from a sensation, conveyed inward to the cerebro-spinal centres, and is then transmitted outward to its final destination, through the medium of one of the sympathetic ganglia," we get a sudden view of the cause of the hystero-neuroses so often to be traced to the existence of anal fissure.

The spinal cord exerts a constant reflex influence over the sphincters, keeping them in a constant state of contraction, which I have already called a state of rest, guarding the outlet of the rectum.

If a finger is pressed into the anus, the sphincters involuntarily contract; the same thing occurs if any irritant is applied externally or if fæces come in contact with the internal sphincter. But this action is susceptible of change and reversal. If the rectum be full, the impression made upon its walls is conveyed to the cerebro-spinal system, and causes relaxation of the sphincters, but contraction of the rectum. In this change of action, however, volition must be recognized.

In the integument lining the external sphincter, and at the bottom of one or more of its folds or pouches, will be found the "crack," "chap," "fissure," or "irritable ulcer," under consideration. It may be single or multiple, a matter we shall find of no practical difference in view of treatment. Very early writers, among whom was Avicenna, mention the affection. Lemonnier, in 1661, mentions it and calls particular attention to it. Until, however, M. Boyer showed the true character of the trouble as well as its proper treatment, it was generally considered syphilitic. The cause of the fissure is generally accredited to the passing of hardened fæces. Doubtless this must be a very prevalent one. But it seems but rational that other causes exist. Anything that inflames the integument covering the superficial or deep sphincter may occasion it; thus we will find it as a sequel of confinement, the lochia having run over, inflaming the anus. A troublesome pruritus, inducing scratching by the sufferer, may lead to it. Or carelessness in cleaning away irritating fecal matter after stool. Small bones, as fish bones, or a shell off the sternum of a fowl, or a bit of oyster shell, all of which I have found in the anus, will give rise to fissure. A careless use of a syringe or rectal bougie is capable of inducing it. It sometimes follows diarrhœa; is often the result of syphilis, or, as Mr. Allingham has stated, is the "accompaniment and probable result of polypus." Persons of highly sensitive nervous systems, with delicate skins, and especially women, are most liable to it, according to my experience; I have had seven cases in women to one in men.

The only really reliable symptom of anal fissure is pain, either present at the time of defecation or coming on as an aching, more or less severe, from a few moments to an hour after stool. Patients rarely, I fancy, imagine what the trouble is, and they come to you complaining of piles, dysentery, neuralgia, and in my experience, often for fancied disease of the womb. One will tell you, "it nearly kills me to have my bowels moved." Another, with exhausted nervous system, rapid pulse and pallid countenance, will say, as if merely incidentally, "with all this weakness, and giddiness, and loss of appetite, I am so constipated that it pains me dreadfully to have a passage," never dreaming that all his or her trouble comes from an insignificant little fissure of the anus. Perhaps your patient is a lady; she conceals the fact of painful defecation; she is nervous, irritable, despondent at times, thinks her disease must be retroversion or prolapsus; her back aches, her head aches, she

has pain in the ovarian regions. She admits indigestion, and intimates that she is constipated, and takes figs, medicated prunes, oatmeal mush, and some cathartic pills occasionally. You have learned from experience how to deal with these fair patients, and you ask if defecation is painful, and you find that it is. You inquire, do you dread going to the water closet? She replies, "always." Do you ever observe any blood? "Just a little stain now and then, but I know I have piles." After stool do you have a drawing sensation at the outlet of the bowel? Often you will get an affirmative answer. Does the bowel ache after stool? "Oh, yes, always; sometimes more; sometimes so much that it makes me sick and I have to lie down." Sometimes a patient has told me that they felt a hard lump at the anus; this I have always found, in cases of fissure, to be in the firmly contracted sphincter.

So often have I found rectal instead of uterine disease the cause of general ill health, that I now never fail to examine the rectum in female patients asserting the existence of uterine disease; and in a score of cases of suspected uterine trouble presenting themselves within a few months I have found more trouble in the rectum than vagina. Ten years ago I got a lesson on this subject, which was salutary. A lady with various hystero-neuroses applied for treatment. The uterus was sensitive to pressure per vaginam; she had headache, and backache; was tender over the left ovary; had dyspepsia, and was much constipated. I treated her with tonics, nervines, laxatives, and drained her uterus with cotton and glycerine; applied liniments to her spine, douched her uterus with hot water, and detained her under treatment for an entire autumn and winter, when she very wisely concluded to change her doctor. She fell into the hands of a surgeon of this city, now aged and crowned with the laurels of many victories. I refer to Dr. John Dickson, who discovered her trouble, divided the sphincter muscle, and in a fortnight put her on the highway which led to recovery. The lady continues well. I have never been picked up on a fissure since. I believe it is a good rule, when a patient complains much of constipation, or of having frequent small discharges, with pain or aching, to examine the anus for fissure.

How are we best to do this?

Place the patient on the left side, in Sim's position for uterine examinations; let the nurse or patient raise the right side of the nates with the right hand, while you, with the middle and index fingers of the left, spread out the folded integument of the superficial sphincter. Wipe it carefully with a little pledget of absorbing cotton, already moistened and held in a dressing forceps. If the folds of tissue are well spread out, and the light good, any "chap," "crack," "fissure," or "irritable ulcer" will be seen. If your patient is a female, lay down the forceps and insert the index finger of the right hand into the vagina, and turn out the lining of the sphincters more completely. I never use an anal speculum for such an examination. I once did so. A patient came a hundred miles to consult me for "piles." I discovered a fissure easily, but not satisfied, I introduced a rectangular anal speculum, and spread the blades to their full capacity, and examined for the "piles," which I assured the gentleman did not exist. I made an engagement with him to divide the sphincter on the following day. He did not keep the appointment, but appeared at my office several days after to say that since he had come to the city he had lost his trouble, and that his bowels moved now without pain. My examination had cured him, and I lost my fee. So now I do not use the speculum to make the examination.

Suppose you find no fissure, but one of several conditions we shall now review. The external sphincter, or both, are unusually irritable, hard and hypertrophied; the semi-mucous lining of the external is congested, and a well defined, bright red line occupies the bottom of one or more of the pouches, yet no breach of tissue is evident. Here is a case which will ere long undeceive you, if you will wait. But you need not delay to treat it as if a well marked fissure existed.

Suppose you find no lesion, but a hard, contracted external sphincter. You pass your finger through it; it seizes the finger with a tight grip; feels like a rigid os uteri; withdraw, pass a well oiled silver pocket probe ever so gently; notice, the muscle contracts and dilates and contracts again; it is preternaturally irritable. If you can find no other cause for the trouble, or if no stricture of the urethra exists, if such a patient be a male, treat him as if a fissure did exist. Irritable sphincter will lead to hypertrophied sphincter, and give rise, as we shall see, to curious phenomena. Sometimes you will find the anus is red and irritable; be gentle, but spread out the tissue smoothly; what was a moment before an unbroken surface will now show small cracks or chaps opening up at several points. The bowels have not moved for several days, and these little breaches, which were opened at the last stool,

were endeavoring to heal. Your examination has done what every motion of the bowels does for this patient. These are fissures. What I want to impress upon my reader is, that he will not always find the club-shaped ulcer, with red base and hard edges, which a novice will recognize as fissure. And that the symptoms of anal fissure are found with irritable sphincter, with or without hypertrophy, and that the neuralgia and spasmodic action of the muscles is sufficiently good reason for the same treatment as if the fissure were recognized. All fissures are not equally painful. If the fissure be crossed by a nerve filament, or expose the terminal end of such a filament, the pain is exquisite.

Having now decided that the neuralgia, or pain, or aching, as the patient may term it, is associated with a fissure, how are we to treat it? You may take your choice of medical or surgical means; you will not always, but sometimes will, succeed with the former, more especially if the sphincters are not hypertrophied. Ointments or lotions may be selected to allay the pain, while the bowels are kept soluble by confection of senna in ordinary form, or with medicated prunes, figs, or tamarinds, equal parts of precipitated sulphur and bitartrate of potash, or by the use of any or many of the natural mineral waters, domestic or imported. The diet should be bland, unirritating and easily digested. The patient should avoid active exercise as much as possible.

For ointments, there are a legion of formulæ; that which I am in the habit of using consists of belladonna, hydrarg. chloridi mitis, opium, oxide of zinc ointment, with a few drops of carbolic acid and a little cod-liver oil. The bowel should be bathed in warm water containing a little bicarbonate of soda, after stool, carefully mopped dry, and the ointment be applied. Once a day is enough, as a rule. A small bit of cotton wool rolled into a little ball may be inserted into the muscle; it acts as a splint, and gently presses the edges of the fissure and flattens them. Beyond this I do not attempt medical treatment, but prefer the surgical means, which are rapid and satisfactory.

There is one method of treating fissure, which I learned from the late Dr. Dale, by which I have cured the disease. This was such a case—

Mr. W. S., editor of a daily paper, applied to me for treatment of "a dysentery" which he had been suffering from for several months. An examination revealed a fissure. He declined to be cut or dilated, and I introduced into the anus every day, for about two weeks, a pocket probe dipped into a fifteen per cent. solution of nitrate of silver. Beyond keeping the bowels soluble, no other treatment was resorted to. He recovered, and has remained well for five years.

I treated other cases this way, but found relapses, and finally dropped the method. Two methods remain: the first is incision of the sphincter ani, first practiced by Boyer, of France, and forcible dilatation, first practiced by Recamier, a countryman of Boyer.

Boyer's operation consisted of complete division of both sphincters, cutting boldly into the connective tissue and fat of the ischial fossa on both sides; and this operation I have seen done in our city within a few years, although it has long ago been modified and greatly improved.

The modifications of the incision itself, and the manner of making it, vary. Boyer, in his operation, introduced a probe-pointed bistoury, turned its edge to the sphincter, and cut out; reintroducing the knife in the same manner, he divided the opposite side. British surgeons, soon after Boyer's discovery, proved that it was not necessary to divide the internal sphincter. Soon afterward they proved that it was not necessary to divide all of the superficial sphincter, but only so much of its fibres as lay at the bottom of the fissure.

This was the prescribed method of treatment until Recamier announced forcible dilatation, made by introducing the thumbs into the anus, hooking the fingers over the ischia, and stretching the muscles until their fibres were felt to part. These, then, are the methods of our time.

Shall we always use either of them? I have for several years done an operation which has never disappointed me, and which I have discovered is done by Mr. Syme in much the same way, which I prefer to either of these methods alone. The patient being etherized, I pass my index finger of the left hand into the rectum; with the right hand I introduce, about one centimeter from the verge of the anus, a curved bistoury, through the external sphincter, and carry it up behind the sphincter to the lower edge of the internal sphincter, where I push it through the tissue alongside my finger, and divide all the muscle over the blade. I now introduce both index fingers into the internal sphincter, and widely dilate it. A well oiled tent is placed in the wound, the bowels confined for three days, moved by laxatives, and at the end of a week the patient is cured. I never make it a point to divide the muscle through the fissure; if it is lateral, I go through it. If it is coccygeal or perineal, it is all the same, the result is equally good.

If the edges of the fissure are callous I pare them with scissors; If a little polypus is in view, I snip it off. I have dilated, without cutting, the sphincter, and have ruptured vessels which gave immense ecchymosis, and I could see the result of my violence longer than after cutting. And in two cases I have been obliged to cut the muscle, dilatation having failed.

I would not advise this method of operating as the best for all, or anybody. One who knows his anatomy, and is dexterous with a knife, will find it easy, quick and satisfactory. I usually complete the operation in less than a minute. But if greater precision be required, an anal speculum may be inserted, and the knife be drawn across the external sphincter at right angles to its fibres, beginning at Hilton's line, and dividing at least two-thirds of the muscle.

Some fissures are found where the sensitiveness, as demonstrated by the point of the probe, is confined to a small spot, which, when touched, will cause the patient to cry out. In such a case a nerve is exposed, and let the position of the fissure be where it may, I have found it good practice, before dividing the muscle, to incise to the depth of a millimeter the bottom of the fissure, thus dividing the nerve. For two weeks after the operation I keep the bowels soluble, and advise plain living, but rarely visit a patient beyond the fifth or sixth day. Spasm and irritability without hypertrophy of the muscle, where no fissure exists, is cured by division or dilatation alone; but if hypertrophy exists, division is the better method, for if the muscle is examined within a month or six weeks afterward, it will be found reduced in thickness to its original size—a change probably the result of fatty degeneration and absorption after the operation.

I have been prolix and tedious in this paper, for no motive save that of calling attention to a variety of diseases, especially frequent among women, and often the cause of a variety of hystero-neuroses often ascribed to uterine disease, when it may or may not exist. And I can assure all, that if they will carefully watch their cases of suspected uterine or bladder diseases, at least occasionally they will find an anal fissure the sole cause of their trouble.

—About a year ago Marion Hovey, trustee for her father, George O. Hovey, proposed to give $10,000 to the Harvard Medical School, "if its advantages could be offered to women on equal terms with men." The overseers have voted that it is inexpedient to recommend to the president and fellows of the university that the proposal be accepted.

Medical Societies.

MEDICAL SOCIETY OF PENNSYLVANIA.

THIRTIETH ANNUAL MEETING.

(*Concluded from p.* 483.)

Dr. I. N. Kerlin, of Media, read a minority report, as follows:—

Minority report of a Committee appointed by the State Medical Society to memorialize the Legislature to enact laws, if any be needed, to authorize the employment by managers of the Hospitals under control of the State, of Women Medical Superintendents for the female departments of said Hospitals:—

The undersigned regrets that he is placed in seeming opposition to the excellent men with whom he was appointed to coöperate.

The resolution under which this committee was nominated, page 33 of last year's *Transactions*, was hastily adopted by a few voices, in the midst of much confusion, when certainly the house was not in deliberative order.

Your Committee of the Minority cannot believe that it was the considerate purpose of the State Medical Society of Pennsylvania to pass over from intelligent and orderly deliberation to accidental, injudicious, and peremptory State legislation, a question that to-day is not settled, but belongs specially to the careful inquiry and experimental trial of the Boards of Managers of our various State Hospitals, under the assistance and advice of the medical men identified with them.

Believing that the Pittsburg session of May 30 was not in business order when this questionable resolution was passed upon; believing that the great majority of the members would have refused their consent to its passage had they understood its bearing, the undersigned would have been pleased to have met the Committee for an expression of your dissent.

The honorable chairman doubtless used his best endeavors to secure a meeting of his Committee, and I do not for a moment impugn his motives nor his methods.

The following is the substance of a letter addressed, on December 23d, by the minority to the members of the majority. I cannot but believe the position taken corresponds with that of this Society.

1. The whole matter of the official management of our State Hospitals should be left to the adjustment of the appointed managers and the medical superintendents of said hospitals.

2. The expediency or ripeness of the measure, either wholly or partially, contemplated in the Resolution of 1878, should be fully discussed in the existing Boards of Managers, and in the Association of Medical Superintendents of the Hospitals for the Insane.

3. If the State Society wishes to establish certain procedures, it is wise, prudent, and professional that, before this Society shall seek coercive legislation at Harrisburg, to affect radically, and possibly injuriously, the existing organization of our State Hospitals, it shall first confer, through its Committee, or otherwise, with the

Association of Medical Superintendents, and with the Board of Management, and endeavor to seek a line of mutual and fair understanding, on which all reasonable men may coöperate.

4. Any other course adopted, or allowed by the State Medical Society, is, to the mind of this minority, unwise and hasty, when we consider the gravity of the change proposed, and, toward that section of our membership, the worthy medical officers of our State Hospitals, ungenerous and unprofessional.

Dr. John L. Atlee, of Lancaster, moved that any further action upon this subject at this time was inexpedient and premature.

This was discussed at some length by Drs. Green, Davis and Sibbett.

On motion of Dr. Gallaher, of Pittsburg, both reports were received.

After some further discussion, the motion of Dr. Atlee was lost, by a vote of ayes, 29; nays, 37.

On motion of Dr. Albert H. Smith, of Philadelphia, the majority report was adopted as the sense of the Society.

On motion of Dr. J. W. C. O'Neall, of Gettysburg, the minority report was referred to the Committee on Publication.

Dr. John Curwen, of Harrisburg, read a report from the Committee on Epilepsy and Insanity.

By the terms of the resolution which appointed me a Committee to report on "the proportional number of epileptics who become insane," the county societies were requested to report to me the number of such within their knowledge. I have not received communications from any county society on the subject, and am not able, therefore, to give any information from such sources. But, that I may not be considered remiss in the performance of the duty assigned to me by the Society, I take the liberty to give some statements on the general subject of epilepsy, and its tendency to the production of mental disorders.

The distinction originally made by the French physicians between the great and the small, as applied to epilepsy, has not been as carefully considered as it should be, the effects of the two forms on the mental integrity being taken carefully into account. In the great epilepsy, that which is so generally called epilepsy, simply characterized by the violent convulsions, the disease may exist for a term of years, in many persons, without any manifest deterioration of the mental powers; and this will be the more evident when the attacks come on after maturity, and the individual has attained full development, because the different organs have attained their full strength and are better able to resist the invasions of disease. Very much, also, will depend on the original constitution of the individual and the freedom from any hereditary taint of any part of the nervous system; while something must also be allowed for the particular organ of the body which, by its disease or disordered action, may have induced the epilepsy; some organs, from their very extensive nervous connections, being much more influential than others.

When the epilepsy commences in childhood or early life, it will be much more likely to impair the mental powers, for the obvious reason that the nervous system being in a formative state and very susceptible to morbific influences, will be much more readily disordered, and the functions, consequently, more or less disturbed; and the extent and degree of that disturbance will depend very much on the frequency and duration of the convulsize seizures.

In the small epilepsy, the disease is manifested by very slight attacks of unconsciousness, often merely an interruption in conversation, continuing for a few seconds only, and most generally attributed to a variety of other causes, and not considered of any serious import, and on this account the disease may exist for a long period unnoticed, and its character unsuspected, more particularly if the attacks should occur during the night.

It has been generally held that this form of the disease is much more fatal to the mental integrity than the other form, from the insidious nature of the attacks, and their long continuance unsuspected; very few cases afflicted with this form of the disease preserve their mental soundness.

So far as I have been able to ascertain, no statistics exist which will give even an approximate estimate of the proportion of epileptics whose minds are affected by the invasions of the disease.

On motion, the report was accepted and the committee continued.

The Permanent Secretary, in the absence of Dr. A. Fleming, of Pittsburg, read the address in Medicine. It was a careful examination into a malady termed "Emotional Fever," giving its differential diagnosis from typhoid, etc., its prognosis, symptoms, pathology and treatment.

It was referred to the Committee on Publication.

Dr. Joseph Parrish, of Burlington, N. J., being present, was invited to a seat with the officers.

Dr. Ellwood Harvey, of Chester, read a paper, entitled "Cholera Infantum." He detailed the symptoms, etc., and gave great prominence to his method of treatment, for which he claimed the best results, viz., blisters to the head, to relieve the brain trouble, which he regarded as the whole source of danger. He detailed a number of cases in which the best results had followed this mode of treatment.

After some discussion, it was referred to the Committee on Publication.

Dr. John H. Packard, of Philadelphia, read a paper on the Diagnosis and Treatment of Fractures near the Joints.

This was discussed by Drs. Atlee and Hodge, and referred for publication.

Dr. Richard J. Levis, of Philadelphia, read a paper on "Fracture of the Radius at its lower end," and exhibited a new splint, which he believed was the best means of keeping the displaced parts in their normal condition until the repair had been accomplished. The splints are struck by a die, in copper, and tinned.

This was referred for publication.

On motion of Dr. J. S. Crawford, of Williamsport, it was

Resolved, That the Medical Society of the State of Pennsylvania, now in session at Chester, Delaware County, views with the deepest satisfaction the progress of the Senate Bill, to create a

State Board of Health, in the House of Representatives, seeing in it a promise that our great Commonwealth will not long remain behind our little sister State of Delaware in establishing this much needed agency for the better protection of the lives and health of our citizens.

Resolved, That this resolution be forwarded by telegraph, to the appropriate officer of the House of Representatives.

On motion of Dr. Michael O'Hara, of Philadelphia, it was

Resolved, That the bill now before the Legislature of this State, providing for the legal restraint of habitual drunkards in asylums especially designed for the treatment of those so unfortunately affected, commands the entire sympathy of this Society, and that we do not hesitate to urge upon the House of Representatives the duty of providing such a resource for the victims of inebriety and the protection of their families and their property.

Resolved, That this resolution be communicated to the proper officer of the House of Representatives, by telegraph.

The Permanent Secretary having announced that the Censors had approved the Constitution, etc., of Greene County Medical Society, on his motion, that body was recognized as in proper working connection with the State Medical Society.

On motion, the Society adjourned to meet at 2½ P.M.

AFTERNOON SESSION.

The President called the Society to order at 2½ o'clock.

On motion of Dr. Albert Fricke, of Philadelphia, all miscellaneous business was limited to fifteen minutes, and all discussion on one subject to five minutes.

The Committee on Publication reported.

The report was read, and the bills allowed.

Dr. Benjamin Lee, of Philadelphia, offered the following:—

PHILADELPHIA, May 21, 1879.

Dr. J. L. STEWART, President Medical Society of the State of Pennsylvania.

DEAR SIR:—I beg leave to present to the Medical Society of the State of Pennsylvania, through you, a copy of the Charter and By-Laws of the "Mutual Aid Association of the Philadelphia County Medical Society." This Association has been formed within the Society during the past year, for the purpose of providing against the recurrence among the members of this Society of those sad cases in which medical men, after lives devoted unselfishly to the cause of science, have died, leaving their widows and orphans dependent on the cold charities of the outside world. That such instances have taken place in our own city and county, and that not among the obscure or the unworthy, but among the bright and shining lights of the profession, those who had been honored with the highest office in the gift of our Society, was felt to be a burning stigma. That they shall not take place in the future, if the profession can be aroused to a sense of its responsibilities in this important matter, is our firm resolve. The experience of similar associations in a neighboring city, of sufficient duration to be conclusive, has been most encouraging. They have been enabled, by the steady growth of their funds from gifts and legacies, as well as from annual dues, to save the families of many of their deceased members from penury and distress. In one instance the family of a member, whose entire contributions had only amounted to forty dollars, received, during a series of years, fully two thousand five hundred dollars.

Apart from these obvious pecuniary advantages, however, and the satisfaction of feeling that those nearest us and dependent upon us are securely protected from want in the event of misfortune overtaking us, it is confidently hoped that a spirit of brotherhood will thus be fostered in the ranks of our profession, subversive of cliques and cabals, and leading us to look on one another less as rivals in the race for honor and competence, and more as comrades, entitled to one another's support, comfort and fraternal affection.

This communication is made partly in the hope that other county societies in affiliation with the State Society may be led to consider whether similar organizations might not profitably be formed within their own bodies. In the more sparsely settled regions of our State several societies might unite for the object of mutual self-protection.

With assurances of my sincere personal regard, believe me, dear sir, yours respectfully,

BENJAMIN LEE, M.D.

President Mutual Aid Association Philadelphia County Medical Society.

On motion of Dr. J. T. Carpenter, the communication and the Charter and By-Laws of the Mutual Aid Association were referred to the Committee on Publication, for publication in the *Transactions*.

On motion of Dr. George Hamilton, of Philadelphia, it was

Resolved, That it be and is hereby recommended to the editors of the various medical publications throughout the country to take into consideration the propriety or necessity of appropriating a larger space in their respective journals to the general practice of medicine and surgery, and a more limited space to subjects that interest only a moderate number of our profession.

The Permanent Secretary read an appeal by Dr. J. P. Seiler, from the action of the Dauphin County Medical Society in his case.

Action on it was temporarily postponed, in order to hear the report of the Committee on Nominations, as follows:—

President—Dr. Andrew Nebinger, of Philadelphia.

Vice Presidents—Drs. Wm. B. Ulrich, of Delaware; Jacob L. Ziegler, of Lancaster; Geo. A. Lynn, of Washington; Joseph A. Murphey, of Luzerne.

Permanent Secretary—Dr. Wm. B. Atkinson, of Philadelphia.

Recording Secretary—To be left to Blair County Society.

Corresponding Secretary—Dr. O. H. Allis, of Philadelphia.

Committee on Publication—Drs. Wm. B. Atkinson, Benj. Lee, Wm. Goodell, O. H. Allis,

J. G. Stetler, Jas. Tyson, Philadelphia; I N. Kerlin, Delaware.

Committee of Arrangements—To be selected by Blair County Society.

Delegates to the American Medical Association.—Drs. J. L. Stewart, of Erie; Jas. Tyson, Philadelphia; Jno. T. Carpenter, Schuylkill; Louis Kuhn, Berks; M. F. Hudson, Mifflin; Jas. M. Shearer, York; J. S. Crawford, Lycoming; Jas. B. Eby, Perry; Jonathan E. Bulkeley, Luzerne; R. B. Brown, Jefferson; Nesbit McDonald, Allegheny; A. M. Miller, Lancaster; J. L. Blatchley, Washington; Isaac Purcell, Montour; S. R. Rutledge, Indiana; I. R. Swigert, Snyder; Chas. Stubbs, Chester; Robert Horner, Adams; Ellwood Harvey, Delaware.

Delegates to the New Jersey Medical Society.—Drs. O. H. Allis, Philadelphia; J. S. Crawford, Lycoming; Geo. R. Welchens, Lancaster; Geo. Stiles, Montgomery.

Delegates to the New York Medical Society.—Drs. A. R. Blair, York; A. Thayer, Erie; Jas. Ogilby, Montour; S. S. Koser, Schuylkill.

Delegates to the Ohio Medical Society.—Drs. Stephen A. Craig, Beaver; W. C. Evans, Erie; Geo. A. Lynn, Washington; Sumner Stebbins, Chester.

Delegates to the Delaware Medical Society.—Drs. W. W. Dale, Cumberland; R. B. Ewing, Chester.

Delegate to the West Virginia Medical Society.—Dr. H. G. Chritzmann, Franklin.

Delegates to the Maryland Medical Society.—Drs. W. S. Roland, York; J. W. C. O'Neall, Adams; Frank Emack, Schuylkill; Alex. Craig, Lancaster.

Delegates to the Massachusetts Medical Society.—Drs. Jno. W. Hughes, Indiana; A. H. Halberstadt, Schuylkill.

Delegate to the Connecticut Medical Society.—Dr. Thos. J. Birch, Schuylkill.

Censors.—1st District. Drs. A. Fricke, Philadelphia; Isaac N. Kerlin, Delaware; Jas. Fulton, Chester.

2nd District. Drs. J. B. Walton, Bucks; Traill Green, Northampton; Wm. B. Erdman, Lehigh.

3d District. Drs. Hiram Corson, Montgomery; W. Murray Weidmann, Berks; D. W. Bland, Schuylkill.

4th District. Drs. Brainerd Leaman, Lancaster; H. O. Whitman, Dauphin; H. O. Orris, Perry.

5th District. Drs. S. B. Kieffer, Cumberland; J. W. C. O'Neall, Adams; Jno. W. Kerr, York; Samuel G. Lane, Franklin.

6th District. Drs. A. H. Shaeffer, Mifflin; D. P. Miller, Huntingdon: Jno. Fay, Blair; J. G. Wilson, Cambria; D. S. Griffiths, Bedford.

7th District. Drs. W. S. Duncan, Fayette; D. G. McConaughy, Westmorland; Wm. Anderson, Indiana.

8th District. Drs. W. S. Foster, Alleghany; S. L. Blatchley, Washington; D. S. Marquis, Beaver.

9th District. Drs. Samuel Graham, Butler; E. Griswold, Mercer; W. S. Welsh, Venango; Jas. Ross, Clarion.

10th District. Drs. A. S. Bonsteel, Erie; T. J. Young, Crawford; David Best, Crawford.

11th District. Drs. A. Hibler, Centre; C. K. Thompson, Tioga; Thos. Lyons, Lycoming.

12th District. Drs. Jas. D. Strawbridge, Montour; E. R. Mayer, Luzerne.

13th District. Drs. D. N. Newton, Bradford; S. A. Smith, Susquehanna.

Next meeting to be held at Altoona, on third Wednesday in May, 1880.

THOS. LYONS, *Chairman.*
ALBERT H. SMITH, *Secretary.*

On motion of Dr. Dale, the report was accepted, and the officers were declared elected for the ensuing year.

Dr. Jacob Price, of West Chester, announced the death of Dr. Isaac Thomas, and offered the following:—

"WHEREAS, This Society has heard with regret of the death of Dr. Isaac Thomas, a member from Chester county, and one of the founders of the Medical Society of the State of Pennsylvania; therefore,

"*Resolved*, That this Society hereby express their profound regard for their late fellow-member, so long an active worker in our ranks, and whose memory will be cherished as one of the honored founders of this Society."

After some touching remarks by Dr. J. L. Atlee, the preamble and resolution were unanimously adopted.

Dr. O. H. Allis, of Philadelphia, read a paper on the "Diagnosis of Fractures near the Hip," etc.

It was referred to the Committee on Publication.

The Treasurer, Dr. Lee, read his report, showing a balance in the Treasury of $1067.16.

It was referred to an Auditing Committee, consisting of Drs. Thomas Lyons, S. T. Davis and W. W. Dale.

Dr. R. A. Cleemann, of Philadelphia, read the Address in Hygiene.

He urged the importance of cultivating the science of hygiene, and deprecated the usual habit of claiming and expecting so much from hygienic measures. He alluded to sewer gas as a supposed cause of all zymotic diseases, when typhoid fever was as frequently the result of the use of foul drinking water. He instanced the prevalence of this fever in many sections of this country where no sewers are found. Less than one-third of the deaths from typhoid fever in large cities can possibly be from sewer emanations. If this cry leads to correction of leaky pipes and foul mains, it is well, but if we assert this as a cause, and it be removed while the disease continues to prevail, such a condition of things would grievously impair the standing of the medical man, and give rise to a suspicion of want of knowledge, etc. Cleanliness alone will not prevent all disease. Cholera infantum rages as fiercely among the cleanly kept portions of the city as elsewhere.

He alluded to cancer as on the increase, it having caused, in Philadelphia alone, during the last seventy years, over 6000 deaths, or over half the number of deaths during the same time from smallpox. Comparing earlier times, we reach a yet more alarming account. From 1807 to 1811 the deaths from cancer were 45 per thousand, while from 1872 to 1876 the ratio was 16.4,

an increase in 66 years of 400 per cent. This ghostly malady, the clutch of which is certain death, gathers to itself, even after allowance for increase of population, twice as many victims as in the beginning of the century. Allowing for varying meteorological conditions and epidemics, we find in the period from 1862 to 1866 a yearly average of 3.14 deaths to 10,000 of the population, while from 1872 to 1876 the ratio was 3.92 per 10,000, making an advance of 25 per cent. In London, the statistics are similar. During thirty years, from 1845 to 1874, the rate advanced from 3.4 per 10,000 to 5.7 per 10,000, an increase of 70 per cent. While the death rate has increased, there has not been a parallel advance in the method of diagnosis. What may be expected from those who live two generations hence? The origin of the disease still remains a mystery. Heredity plays an important part in producing and perpetuating this malady, and to those inheriting a predisposition to this fearful ailment the advice would be marry not at all.

He alluded with much congratulation to the establishment of the National Board of Health, the prospect of a State Board in Pennsylvania, with auxiliary organizations in each county.

On motion, the address was referred to the Committee on Publication.

The Auditing Committee reported that they had examined the accounts of the Treasurer, and had found them correct.

The report was received, and the Committee discharged.

Dr. Benjamin Lee exhibited his method of applying the porous felt jacket for curvature of the spine. The special advantage over the plaster-of-Paris jacket was its capability of being removed, for cleanliness; allowing the excretions to escape, etc. He then exhibited a patient to whom it had been applied, and extended him in the proper way for applying the jacket.

Dr. Hiram Corson, of Conshohocken called up the case of Dr. Seiler, and asked that Dr. Traill Green, of Easton, who had been a party to the arbitration at Pittsburg last year, might be allowed to make a statement.

On motion of Dr. W. W. Dale, of Carlisle, this was allowed.

Dr. Green then explained the arbitration, etc., and said that all understood that this settled the affair.

Dr. Atlee then urged its reference to a special committee, to report at this session.

Dr. Curwen moved, as a substitute, that this Society now approve the action of the Censors of the 4th District.

After some discussion, by request the report was again read, when Dr. Andrew Nebinger, of Philadelphia, raised the point of order that the report was incomplete, inasmuch as it contained no date or locality.

The President decided the point as well taken, and ruled the report and Dr. Curwen's motion out of order.

On motion of Dr. Wm. Pepper, of Philadelphia, it was agreed that a special committee should be appointed by the President to investigate the status of Dr. J. P. Seiler, and report at the next annual session.

Vice President Dr. J. T. Carpenter having taken the chair, Dr. Pepper read a paper entitled "A Clinical Contribution on Exophthalmic Goitre;" he gave the symptoms and causes of the disease, its pathology and treatment, and detailed the history of thirty-one cases, ranging from childhood to old age. It was most frequently observed in children, and was largely due to anæmia, hard work, anxiety and poor food. His treatment was the use, in large doses, of iron, especially the dialysed form. On motion it was referred to the Committee on Publication.

The President now resumed the chair.

Dr. J. V. Shoemaker, of Philadelphia, read a paper on the External Treatment of Skin Diseases, and exhibited a variety of soaps, oleates, etc., which he had found useful. The paper was referred to the Committee on Publication.

The President then introduced Dr. H. Genet Taylor, of Camden, N. J., a representative from the Medical Society of the State of New Jersey.

Dr. Taylor was invited to a seat with the officers, and made a few appropriate remarks.

Dr. Geo. Hamilton, of Philadelphia, offered the following resolution, which was rejected—

Resolved, That it be and hereby is recommended, that papers to be read before this Society be held within such limits as will afford time for brief and pointed discussion thereon, so that the valuable experience of members may find opportunity for expression.

On motion of Dr. Ulrich, it was agreed that this Society shall meet next year, at 9 A.M., on Wednesday (the first day), and continue in session four days, if business offers.

Dr. P. D. Keyser, of Philadelphia, read a paper on Color Blindness, being the result of an examination of workmen on railroads. Three and a half per cent. were color blind, mistaking one color for another. Eight and a half per cent. could not distinguish shades. The first were, therefore, unsafe to employ where the color of signals becomes important. He found two men thus blind who had educated themselves to know red from green, because the former was more intense. Green was to them a deep or dull color, hence dark red, dark green and brown were all green to them, and they would call them such. This showed them to be unsafe as signal men. Again, he found that they could distinguish bright red when within three feet, but at ten, twenty or thirty feet it was called green. He stated that the study of color had been introduced into some of the lower classes in the schools.

Dr. O. H. Allis, of Philadelphia, offered the following amendment to the Constitution:—

AMENDMENT TO ARTICLE V, SECTION 10.

"If any member or members of a county medical society shall violate the code of medical ethics, it shall be the duty of said county medical society to discipline said member or members, and if any county medical society shall refuse or neglect to do so, it shall be the duty of the Censor of the State Medical Society, on being notified of such delinquency, to officially notify said medical society of the charges made against it. And in case said county medical society shall neglect or refuse to investigate said charges, and to discipline the member or members so

charged, within six months from the time so officially notified, said county medical society shall forfeit all its privileges and connections with the State Medical Society, and the severance shall be publicly announced at the ensuing annual meeting of the State Medical Society."

Objection having been made to its immediate adoption, according to rule, it laid over till next session, in 1880.

On motion, the Society adjourned to meet on Friday at the Institution for Imbeciles, at Media.

MEDIA, INSTITUTION FOR IMBECILES,
Friday May 23d.

The President called the Society to order at 9½ A.M.

He announced as the Committee to investigate the status of Dr. J. P. Seiler, as ordered by resolution of yesterday:—Drs. Traill Green, Easton, Chairman; Thos. Lyons, Williamsport; Alex. Craig, Columbia; J. W. C. O'Neall, Gettysburg; W. F. Knox, McKeesport; J. S. Crawford, Wilkesbarre; and Wm. Anderson, Indiana.

The Permanent Secretary read the following, which was ordered to be entered on the minutes:

DERRY STATION, PA., May 20th, 1879.

To the Medical Society of the State of Pennsylvania—

Having been appointed as one of your delegates to the Medical Society of the State of West Virginia, I attended the annual meeting of that body, and in consequence of being unable to attend the present meeting of our Society I submit the following report:—

The Society met in the Court House at Weston, on Wednesday, May 22d, at ten o'clock A.M., and was called to order by Dr. Wm. M. Dent, First Vice President, who, in the absence of the President, Dr. James H. McSherry, occupied the chair. The attendance at this session was not as large as on some previous occasions, on account of the want of railroad facilities, the town of Weston being twenty-three miles from Clarksburg, the nearest railroad station.

Upon being introduced by Dr. A. H. Kunst, as a delegate from the Medical Society of Pennsylvania, I was invited to be seated with the members and to participate in the proceedings, after which I tendered your fraternal feelings, and assured them that the Medical Society of the State of Pennsylvania recognized in them a body who are alive to the promotion of the best interests of the profession and the advancement of true medical science.

The papers read were of a high order of excellence, and called forth interesting discussions.

Notwithstanding the fact that their Society is young in years, having been organized since the close of the war, its members are full of life, and striving with zeal and energy to elevate the profession in their State, and to dispel from their midst the *Herb Doctors*, *Quacks*, and the many *Humbugs*, by whose ignorance and mismanagement of disease so many of the human family are brought to untimely graves.

During the afternoon of the first day's deliberations the society visited the West Virginia Hospital for the Insane, which is located at this place, and were shown through the various wards. A reception and entertainment were given in the Hospital in the evening, where the citizens paid their respects to the Society. Thanking the Society for the honor conferred in sending me as a delegate, I am, very respectfully,

I. P. KLINGENSMITH.

A bill for fifteen dollars, from the Committee on Female Superintendents, etc., Dr. H. Corson, Chairman, was presented, and ordered to be paid.

The Permanent Secretary read the following resolution, as having been adopted at the last session of the American Medical Association:—

"*Resolved*, 1. That the American Medical Association adopts the International Metric System, and will use it in its *Transactions*.

"2. Requests that those who present papers at its future meetings employ this system in their communications, or reprints thereof.

"3. Requests the medical boards of the hospitals and dispensaries to adopt the Metric System in prescribing and recording cases; and that the faculties of the medical and pharmaceutic schools adopt it in their didactic, clinical or dispensing departments.

"4. Requests the physicians familiar with the Metric System to help their confreres and the druggists in its application; and the delegates present at this session to work up the acceptance of the Metric System by their respective county and State Societies.

"5. Requests our President to name a Metric Executive Committee, of which he shall be the ex-officio Chairman, and whose task it will be to give unity and rapidity to this Metric movement."

On motion, the communication was entered upon the minutes.

A note from Dr. Joseph A. Reed, of Dixmont, was read, regretting his inability to be present and present the Address on "Mental Disorders."

The President announced the following:—

To prepare the Address on "Medicine," Dr. Thos. W. Shaw, of Pittsburg.

Address on "Obstetrics," Dr. John T. Carpenter, of Pottsville.

Address on "Surgery," Dr. John H. Packard, of Philadelphia.

Address on "Mental Disorders" Dr. Isaac N. Kerlin, of Media.

Address on "Hygiene," Dr. Benjamin Lee, of Philadelphia.

The Committee on Unfinished Business reported no unfinished business.

Dr. John Curwen, of Harrisburg, read a paper on Nocturnal Epilepsy.

By request of the author this was not referred.

The report of the Committee on State Board of Health was read, accepted, and the Committee continued until their work had been completed.

REPORT OF COMMITTEE ON STATE BOARD OF HEALTH.

Your Committee respectfully report, that in accordance with their instructions, they addressed a memorial to the Legislature, urging the passage of the bill reported by the State Society, and personally visited Harrisburg for the purpose of impressing upon the members the importance of

the measure. In the meantime, another bill upon the same subject was introduced in the Senate, and your Committee judged it expedient to give their support to this, as amended at their suggestion, rather than run the risk of jeopardizing the interests of both. The following is the bill as thus amended, which has passed the Senate and is now on second reading in the House. While omitting some important details contained in our own bill, it introduces a valuable feature, that of County Boards of Health, which may be considered an equivalent. While not venturing to make a confident prediction as to the final action of so uncertain a body as a State Legislature, we are able to say that the Act has reached a further stage than any previous one for the same purpose.

Signed, W. B. Atkinson, *Chairman.*
Benj. Lee.

On motion of Dr. T. J. Gallaher, of Pittsburg, the thanks of the Society were returned to the Committee for their labors in the matter.

Dr. B. Lee, of Philadelphia, offered a special vote of thanks to the Camden and Atlantic R. R., for their courtesy to the Society, and the Secretary was requested to transmit to its officers a copy of the resolution.

Bills from the Committee of Arrangements, to the amount of $78.32, were ordered paid.

By request, Dr. Joseph Parrish made some remarks on Inebriate Asylums.

On motion of Dr. Green, Dr. Parrish was requested to prepare his remarks for publication, and a vote of thanks was returned to him.

On motion of Dr. Lee, the Committee on Publication were requested to publish with these remarks the memorial and bill for the care of inebriates.

On motion, a recess was taken, in order to allow Dr. Kerlin to exhibit the building and the mode of training the children.

After the members had been most satisfactorily entertained, by a thorough examination of the building, etc., and by an exhibition of the modes of training and instructing the children, the Society was again called to order by the President.

Dr. Edward Seguin, of New York, was invited to a seat on the platform.

The Committee on Columbia County reported as follows:—

Chester, May 22d, 1879.

To the President, etc., of the Pennsylvania State Medical Society:—

Gentlemen:—The Committee to whom was referred the communications presented to the Society by the corresponding Secretary, Dr. Oscar H. Allis, respectfully report the following resolutions, and ask their adoption, viz.:—

Resolved, That the communications and correspondence presented to the Society by the Corresponding Secretary, Dr. O. H. Allis, in regard to Dr. A. L. Turner, of the Columbia County Medical Society, be, and they are hereby referred to said county Society, for its consideration and action.

Resolved, That, if said Columbia County Medical Society shall not consider and take action upon the charges embodied in the communications and correspondence presented by the Corresponding Secretary to this Society, before its meeting to be held in 1880, that the Columbia County Medical Society shall be stricken from the list of the Societies which have a right to representation in this body.

A. Nebinger,
A. H. Halberstadt,
J. A. Murphy,
A. Thayer,
Traill Green.

On motion, the report was received and the Committee discharged.

Dr. William H. Pancoast, of Philadelphia, showed the Society a new urethrotome of his devising, which he had successfully used, operating with it in nineteen cases of stricture of the urethra. The construction of the instrument is very simple. It is fashioned after the shape of the staff of Prof. Simes, of Edinburg. In Dr. Pancoast's urethrotome the probe end is hollow, and is passed down upon a whalebone filiform bougie into the urethra; the shoulder of the instrument strikes the stricture, and a small, concealed knife is then pushed forward from the shoulder, cutting the stricture band in any way desired. The instrument seemed to be a great improvement on others, from its simplicity and strength, there being no delicate joints which might break or rust. It also seemed a safe one, as the whalebone guide must first be passed, and then the urethrotome is pushed surely and directly into the bladder, over the whalebone bougie.

He then spoke of methods of excising the upper jaw, for cancer. He demonstrated from a skull the anatomical structure and attachments of the upper jaw to the other bones of the face. He showed how prominent is the malar bone, and how important a bone it is in the structure of the face, supporting the cheeks, and preserving the expression. This bone is one of the hardest and most solid in the skull, and as Dr. Pancoast had found it often healthy and sound, even in the worst cases of cancer of the upper jaw, he was led to save it, both for the preservation of the shape of the face, and so as not to remove any more bone than was absolutely necessary. His plan, as he described it, is, after opening up the face by a sweeping incision from the ear, just in front of the temporal artery, forward, in front of Steno's duct, and then through the upper lip, to attack the jaw, at first in the usual way, cutting through the palate process, then the nasal process of the bone. He then passes an eyed probe, or large curved needle, armed with a ligature, beneath the eyeball, and down through the sphenoidal fissure, which is in the floor of the orbit. This ligature then pulls through a chain saw, which divides rapidly the attachment of the upper jaw to the malar bone. He then, with a chisel, pries out the jaw bone, cutting at the same time the superior and inferior maxillary nerves, leaving the malar bone in position, and uninjured. The speaker said he had used this method already in four cases, one recently, in the clinic of Jefferson College Hospital, and was much pleased with the result. The contour of the jaw is preserved, and it is remarkable how little deformity exists after such a severe operation.

He spoke of synovitis of the joints, and showed how articular cartilage does not ulcerate, but is absorbed away by the inflamed vascular and thickened synovial membrane. This he illustrated by referring to cases where he had been obliged to exsect joints, and even amputate limbs, for advanced cases of synovitis, accompanied by caries and destruction of the bones. In no case did he ever find the articular cartilage inflamed, but softened and macerated, as in a macerating tub, while the synovial membrane was vascular and swollen, and could be lifted up from the surface of the articular cartilage, which it was softening and absorbing. He has saved many joints by attending to this pathological fact. In cases of synovitis he employs the well-known principle of gently keeping the joint extended, and then, by counter-irritation over the joint, and such constitutional treatment as may be needed in addition to the rest, has made many cures, thus saving joints and limbs.

The speaker showed a splint that he had just removed from a patient affected with synovitis of the right wrist. The seat of greatest pain being where the metacarpal bone of the middle finger articulated with the os magnum. The wrist was nearly twice as thick as the other. The lady said she had been suffering for three years, and had been under treatment. She showed a prescription of mercury and iodide of potassium that had just been given her. The splint, a simple shingle, covered with black silk, had a hole in the front part of it, large enough for the fingers to play through. To the rim in front the hand was fastened by a strip of silk or bandage, tied into a loop of plaster fastened around the hand. The other end fastened by adhesive strips to the forearm, just below the elbow, so as to keep the wrist joint gently and firmly extended. The specific medicine was not given, and no medicine, but a succession of blisters on the back of the wrist, over the point most tender to pressure. She has been under treatment for about three weeks. The soreness has all disappeared, and the hand is comfortable and natural, save the undue thickness of the wrist. The patient is still under observation.

He mentioned another case, of rheumatic synovitis of six weeks' standing, accompanied with great pain, swelling of the joint and a grating at the inferior radio-ulnar articulation. The patient showed the evidences of great suffering and loss of sleep. A similar splint and treatment was instituted, with additional treatment for the rheumatic diathesis. The patient, a woman, was much better, but still under treatment and wearing the splint.

He mentioned two cases of synovitis of the wrist of the right hand. One caused by a gunshot wound, another from a blow. Both patients, men, insisted upon having their hands amputated. But the speaker said he refused to do so, and saved both hands. In one, a private case, he split the hand to the wrist and cut out the middle finger, corresponding metacarpal bone and diseased bones of the wrist, bringing the hand together again. In the other he exsected the wrist joint, and cut off the radius and ulnar, at the Philadelphia Hospital. Both cases resulted successfully, and the patients are earning their living as clerks, writing with the same right hands they wished amputated.

The speaker mentioned another case of synovitis of the ankle joint, with caries, resulting from a gunshot wound. (The patient a lieutenant in the Union army during the Rebellion, and shot in Florida.) The speaker split the foot to the ankle joint, removed the second toe, corresponding metatarsal bone and the diseased bones of the tarsus. After tying the blood vessels, he united the wound, and the patient is walking on his foot now. This patient had suffered so much that he wished his foot amputated.

He also mentioned that for some years he had been using black sewing silk as a suture, and that he preferred it usually to all others. It could always be obtained from a lady's workbox. The iron used in the dye made it easily supported by the flesh, and from its color he could use a finer ligature than of white, as it could be so easily seen. In plastic surgery, he found the flesh endured its presence for a long time; from the color, it could always be readily found without disturbing the wound, and it could be made as strong as desired by simply waxing some threads together, and if needed, could be carbolized.

The President appointed Vice Presidents Drs. T. J. Gallaher and J. T. Carpenter, to escort the President-elect to the chair.

Dr. Ulrich, Chairman of Committee of Arrangements, offered a paper on removal of an intraocular (living) cysticercus from the eye of a man, by Dr. Jas. E. Garretson, of Philadelphia, with remarks by Dr. Chas. S. Turnbull, of Philadelphia.

It was referred to the Committee on Publication.

The President-elect, Dr. Andrew Nebinger, of Philadelphia, was now presented, and the retiring President made some remarks, thanking the Society for the confidence reposed in him.

Dr. Nebinger took the chair and gave a brief address, thanking the members, etc.

On motion of Dr. John L. Atlee, thanks were returned to the retiring President, for the able and impartial manner in which he had administered the duties of his office.

The Vice Presidents then took their positions. Dr. Gallaher introduced Dr. E. Seguin, and he gave, by request, some remarks on idiocy and its treatment.

On motion of Dr. Atlee, the thanks of the Society were returned to Dr. Wm. B. Ulrich, Chairman of the Committee of Arrangements, and to Dr. Isaac N. Kerlin, for the manner in which they had cared for the wants of the Society and had contributed to the success of the meeting; to the officers of the Society, for their earnest labors in the performance of their duties; to the various railroad companies, for courtesies extended to the delegates.

On motion, the Society adjourned, to meet in Altoona, on the 3d Wednesday of May, 1880, at 9 o'clock, A.M.

—Experienced and reliable nurses for private cases can now be secured by applying at the Pennsylvania Hospital.

NORTHERN MEDICAL SOCIETY OF PHILADELPHIA.

STATED MEETING, MARCH 28TH, 1879.

Dr. J. T. Eskridge read a paper upon "Functional Disorders in Digestion."

Dr. E. E. Montgomery remarked that he had derived great advantage, in one form of dyspepsia, from the use of silver nitrate combined with hyoscyamus. He meant not a simple relief of one attack of indigestion, but a full recovery of the powers of the stomach, so as to be able to digest as formerly (pork, for example).

Dr. Robert Burns remarked that he had found the disorders most prevalent among two classes in society: first, those who habitually consume large quantities of food, great eaters; second, those who consume large quantities of liquids, great drinkers. He thought that the bad habits of living, too rapid eating, and especially improperly prepared food and bad cooking, were the two most frequent among the immediate causes of dyspepsia. He also believed tobacco to be a most fertile cause. The common practice of treating acid pyrosis by alkalies he could not too heartily condemn. He found most benefit from tonics, as iron and strychnia, nitro-muriatic acid, etc.

Dr. E. R. Stone called attention to the small doses of pepsine usually given, the amount far too small to be of much assistance in the solution of food, as shown by artificial digestion. He suggested that it might in some way act as a stimulant. He also called attention to the apparent aid to digestion given by a small amount of tobacco.

Dr. Eskridge remarked that he believed that the movements of the stomach, together with the rapid absorption, accounted for the relatively large dose of pepsine required for artificial digestion, though he gave larger doses than many—rarely giving less than ten grains, three times a day.

Dr. E. E. Montgomery presented a tumor, oval in outline, three-quarters of an inch by half an inch in diameter, which he removed from the second phalanx of the ring finger of a child about ten years old. It was situated on the dorsum of the finger, and apparently in the connective tissue, beneath the skin; said to be congenital, and that it had increased in size during the past year.

Dr. L. B. Hall had made a microscopic examination of the tumor, which he found to consist of concentric layers of epithelial cells, in various stages of fatty degeneration. The tumor was, therefore, a "sebaceous" one. He thought the locality a rare one.

Dr. H. Rihl said he remembered removing a similar tumor some years ago, from the eyelid of a young lady, aged about 18. The tumor was said to have been congenital, and excited considerable interest at the time, because he found hairs growing from the interior wall of the tumor.

Dr. Hall remarked that if the commonly received theory of origin of these tumors be the correct one, viz., that they are plugged up sebaceous glands, the wonder is that hair is not more commonly found.

EDITORIAL DEPARTMENT.

PERISCOPE.

On Chronic Ovaritis and its Treatment.

In a late lecture reported in the London *Medical Times and Gazette*, Dr. J. Matthews Duncan says: Occasionally this disease is seen as a consequence of fever, especially typhoid, cholera, rheumatism; and, in close connection with these diseases, it is very frequently a result of the use of alcoholic liquors, even when these are not taken to excess. At present my impression is that that is a most frequent cause of the disease; and this view of the causation of the disease is in the most gratifying manner frequently corroborated, if not proved, by the cure which follows upon the adoption of teetotal living. A great mass of cases occur as a consequence of recent marriage, suppression of menstruation, abortion, and delivery at the full time, when there is no evidence of blood poisoning. In a certain class of women you have the disease occurring in its most characteristic form; and it is in young strumpets that the disease is best studied. There it is a consequence of gonorrhœa. The inflammation extends to the ovaries. It may be chronic for a considerable time, and produce, as its chief annoyance to the patient, slight loss of blood, in consequence of the endometritis which in this case accompanies it. Then the disease may produce perioophoric adhesions; and, under proper treatment, you may watch the disappearance of these perioophoric adhesions and the disappearance also of the ovaritis. It is in cases of young strumpets that I have learned most of what I have been describing to you to-day. Now a few words on the treatment; and I begin by telling you that you will find a great many cases chronic—which is almost a synonym for incurable. I advise you, indeed, in many cases which resist a properly conducted treatment, to give up the attempt at cure. You will only bother your patient, make her a valetudinarian, and do her harm, by further persistence in attempting to cure a disease which proper treatment has failed to remove. The treatment is modified according to the nature of the disease, according to its acuteness. In every case you wish rest; and no doubt, the more serious a case is the more strict should be your injunction as to rest, and in bed. Physiological rest can only be obtained very imperfectly, for the woman must menstruate, and that is an interference with physiological rest. In married women there are other difficulties which do not require to be described. In many cases the use of leeches

applied to the neck of the womb, or applied over the inguinal ring, is very valuable. The medicines most relied upon are corrosive sublimate, iodide of potash, and bromide of potash. As leeches are specially useful in the acute cases, so repeated blisters over the inguinal ring or in that region are frequently very valuable in the chronic cases. Lastly, it has of late years frequently been decided to spay women in this disease; and many cases of the operation are recorded. That operation is still *sub judice*. Most gynæcologists say that it is condemned already, but upon it I reserve my opinion.

The Therapeutic Value of Croton-chloral.

Dr. R. Riddell speaks, in a paper printed in the Dublin *Journal of Medical Science*, favorably of this new remedy. He says, after quoting his first instance—

Since that time I have used it largely—sometimes failing, sometimes relieving—till, by keeping an account of all my cases, it began to dawn on me which were benefited by the drug. Since then the number of cases relieved (some permanently) has increased. These cases are—headache in females, arising from mental distress; those cases of headache so frequent at the menopause—in fact, all those called neuralgic, except a few arising from internal mischief, are benefited, and in many instances, cured. In that distressing species of neuralgia called tic-douloureux, I have found it in many cases acting like a charm. Of course I do not include any arising from cranial or intercranial causes. I have tried it in neuralgia of the ovaries, but no good resulted. In insomnia it is not so reliable as the hydrate, but in some cases, where the loss of, or inability to, sleep is accompanied by a weak or fatty heart, it is to be preferred, as it has no weakening effect on the central organ of the circulation. In one case of delirium tremens, where the circulation was very feeble, the combination of croton-chloral with digitalis had a wonderful effect, and it seemed as if the drugs could be given together in much smaller doses, to produce the same results, than singly. In this I pushed it from ten to thirty grains every three hours, with drachm and two-drachm doses of the infusion of digitalis. In pain arising from caries of teeth, I have found it useless in most cases, and in all inferior to Richardson's "tr. gelsemini;" but in one case, of a nervous young lady, by giving her two ten-grain doses, I was able to extract a tooth next to painlessly, to her great satisfaction. You will notice in all these cases it is in affections of those parts supplied by the fifth pair of nerves that it is of most use; but to be of service, you must give the drug in far larger doses than prescribed in the Pharmacopœia—for adults, five grains, three or four times daily, gradually increasing if required; if stimulants are wanted, dissolve it in rectified spirit; if not, dissolve it in glycerine. In all cases complicated with hemorrhoids, give glycerine. If anæmia exists, combine it with iron, or, which I believe better, arsenic; then gradually lessen the chloral. In all cases I have found it better to give it in solution than in powder or pill.

Treatment of Puerperal Mania.

Dr. S. Putnam says, in the *Transactions* of the Vermont State Medical Society—

We should first learn betimes the vulnerable points and tendencies of our patients, and regulate their hygiene and medication accordingly. Should a latent albuminuria be found, let the patient live upon milk diet; use the warm sitz bath at night, followed by abundant frictions to the back and limbs. In the morning, cold or tepid sponging, with friction, to be followed by walking, or carriage exercises. At lying-in, avoid as far as possible the causes of anæmia, prostration, irritation and excitement.

Should the patient be unable to sleep, make the conditions the most favorable to secure that result, and if sleep does not occur, use chloral, morphia and camphor, or whisky in quantities ordinarily adequate to produce that effect, and I believe we shall seldom have puerperal mania to treat. But should a threatening case explode on your hands, notwithstanding your care, perhaps a cathartic is needed, especially if constipation exists, after which a more efficient use of anodynes, stimulants and tonics may succeed. Should they not, and the delirium be violent, aconite, veratrum or digitalis might be used, or even anæsthetics. When uræmic delirium or stupor is evident, I have used, with benefit, ten grains nitrate potas., one drachm nitrous ether, and five drops of dilute nitric acid in water, every four hours; or instead, when insomnia persists, ten or fifteen grains bromide potas. every two hours, alternately with twenty drops tinctura ferri muriati. Meanwhile, nutrients, stimulants and tonics are to be given as needed.

Typhoid Fever and its Treatment.

Dr. E. F. Wells reports, in the Toledo *Medical Journal*, thirty-five cases of typhoid fever, with only two deaths. The treatment employed was mainly dietetic and regimenal, together with the liberal use of the mineral acids throughout the whole course of the disease. An ordinary case was put to bed in a cool, airy room, from which the greater portion of direct and diffused light was excluded. The bed clothing, of cotton, light, and changed daily, as well as the patient's under clothing. A tepid sponge bath once or twice daily, the last at bedtime.

Diet consisted exclusively of milk, uncooked eggs, beef tea, and similar articles; the main reliance, however, was placed upon milk, in any form desired by the patient, and was taken without complaint, or with relish, by all save one or two of the cases. Food was given in regular intervals. The bowels were kept open, but any inordinate diarrhœa was attempted to be controlled. Rest and sleep was assured by the use of opium and its succedanea. Delirium was treated with full doses of alcoholic liquors. From fl. ℥ ss to fl. ℥ j of the dilute mineral acids, plentifully diluted with water, and sweetened and flavored to suit the taste, was taken with relish and evident benefit by all the cases. Cases accompanied with much tympanitis were greatly relieved by the use of turpentine, given either alone or in combination with castor oil, as was indicated by the symptoms.

Reviews and Book Notices.

BOOK NOTICES.

Essays in Surgical Anatomy and Surgery. By John A. Wyeth, M.D. Wm. Wood & Co. 8vo, pp. 262.

In this volume we have a number of papers, previously published, collected and given a more permanent form, for which we should be thankful to the publishers, for certainly no essays ever more justly deserved the compliment of being reprinted. The greater part of the book is occupied by the discussion of the surgical anatomy and surgery of the innominate, subclavian and carotid arteries. The author has made many dissections of the vessels, and gives elaborate tables of the points of origin of the branches, in order to establish the proper situation for application of the ligature in aneurism, wounds, etc. By means of diagrams he shows, in a graphic manner, the range of variation of the branches, the anomalies found at times, and the venous relations of the vessels. In addition, collections of cases of ligation of these vessels are given, embracing all the published instances that could be found by the author, and many obtained by personal correspondence. The extent to which this has been carried is evident when it is mentioned that there are tabulated 789 instances of ligation of the common carotid; 91 of the external, 18 of the internal carotid; 16 of the innominate; and 286 of the subclavian. These tables serve as a basis for valuable deductions made by the author, with the aid of the light furnished by over one hundred careful dissections. The reader will therefore see that the prizes of the American Medical Association were well merited by these surgical studies. The most important fact developed by the consideration of the subject is, that a ligature should never be applied to the common carotid for a lesion of the external, except there be no room to permit the ligation of the external between the lesion and the bifurcation of the primitive. The rate of mortality after tying the primitive trunk is said to be forty-one per cent., after ligation of the external four and a half per cent. The fact that nearly all of us have known of ligation of the common trunk where tying the external was scarcely considered, shows that it has become the custom of surgeons to look upon ligation of the external carotid as an operation to be seldom performed, while many hundreds of instances of the more serious operation are recorded. If Dr. Wyeth's words cause every man to halt before placing the ligature about the primitive carotid, there will be much good done in the way of conservative surgery, and many lives saved that would doubtless have been sacrificed by undue haste in deciding upon the point of ligation.

In speaking of ligation of the innominate for the cure of subclavian aneurism, he says that circumstances justifying this procedure will occur so rarely that practically the operation should be abolished, and that nature unaided is more successful than surgery which ligates this vessel. In gunshot wounds of the axillary region the axillary artery should be tied in the wound on both sides of the opening; this is better practice than to ligate the subclavian, because there is risk of hemorrhage when the collateral circulation is established. There are very many important conclusions and deductions made which could be studied with profit, but it is necessary for one to see the book to appreciate it, as all its merits cannot be presented in a short review. The papers on the tibio-tarsal region, the obturator artery, and the hip joint, are good, but have less surgical interest than the essays mentioned above. J. B. R.

Handbook of Diagnosis and Treatment of Diseases of the Throat and Nasal Cavities. By Carl Seiler, M.D., Lecturer on Laryngoscopy at the University of Pennsylvania, etc. H. C. Lea. 8vo, pp. 156.

The intention of this book is to serve as a guide to students in laryngoscopy. The instrument is described, the images explained, a chapter given to the general pathology and therapeutics of the part, and the symptoms and treatment of the principal forms of laryngitis, pharyngitis, diseases of the nasal cavities and tonsils, neoplasms and functional disorders added.

The execution of the work is well enough for the object stated; but judged by a higher standard than that of the ordinary student's manuals, it seems lacking in original features, observations and arrangement. The suggestions for treatment are quite superficial; for instance, under pharyngitis nothing is said of guaiacum, and under the abortive treatment of coryza, opium, the only real abortant, is not mentioned. The illustrations, thirty-five in number, are all copied from other books. There is a table of symptoms of the diseases of the larynx, similar, but not superior to that in Lenox Browne's work. The mechanical execution of the book is of the careful character usual with the publisher.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	$5.00
Half-Yearly Compendium of Med. Science,	2.50
Reporter and Compendium, - - -	7.00
Physician's Daily Pocket Record, - -	1.50
Reporter and Pocket Record, - - -	6.25
Reporter, Comp. and Pocket Record, - -	8.25

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

PHILADELPHIA, PA.

THE MEDICAL AND GENERAL BOTANY OF THE PACIFIC STATES.

The sixth volume of the "Report upon United States Geographical Surveys west of the one hundredth meridian" forms a handsome quarto of four hundred pages, carefully illustrated with plates. It comprises the botany of Lieutenant WHEELER'S expedition in 1873–76, and has been prepared by Dr. J. T. ROTHROCK, surgeon and botanist to the expedition. The combination of the two duties in Dr. ROTHROCK was particularly fortunate, as he is well known, both as a skillful physician and surgeon, and as a botanist in the very front ranks of that science. His work shows that he has studied the flora of the region he traversed, not merely in regard to its place in the vegetable world, but also in its economic and therapeutic light as well.

So much quackery and humbug have been bolstered up of late years upon the medical flora of California and the adjacent territories, that it is refreshing and instructive to see how a really scientific botanist and physician handles the subject. Eclectic doctors, speculative manufacturers and nostrum venders have had their turn, and it is high time that the profession turn a deaf ear to their exaggerated advertisements and listen to the report of a cool and competent writer.

The chapter of the report most to our purpose is the third, "Notes on Economic Botany." There appears to be quite a number of food plants in Colorado, New Mexico and Arizona, of which we have had little or no knowledge. The Oregon grape, *Berberis aquifolium*, yields a palatable and wholesome wine; a wild cabbage, *Caulanthus crassicaulis*, is a not despicable substitute for the garden variety; the seeds of *Salvia columbariæ* are ground into meal, and make a very popular food with both Mexicans and Indians; the mescal whisky, distilled from the juice from the flower stem of the *Agave palmeri*, has the inestimable advantage that it is impossible to adulterate it without destroying its peculiar flavor.

Of more strictly therapeutical interest, Dr. ROTHROCK mentions the *Fremontia Californica*, the inner bark of which develops large quantities of mucilage, similar to the slippery elm of the eastern States; the *Laurea Mexicana*, or creasote bush, esteemed by the Mexicans in rheumatic affections; the *Eucalyptus globulus*, now largely planted in Southern California, and which, as an antiperiodic, has disappointed Dr. ROTHROCK every time he has used it; the *Cucurbita perennis*, alleged to be a remedy for piles; the *Grindelia robusta*, of the wide range of whose therapeutic value the author expresses himself "in the highest degree skeptical;" the *Bigelovia veneta*, the "Damiana" of Northern Mexico, about which he tersely says, "I consider it utterly worthless as a remedial agent;" several species of *Eriodictyon*, all huddled together under the common name *Yerba Santa*, about whose medical properties we have no certain evidence at all; the *Ephedra anti-syphilitica*, known through New Mexico under the expressive name "whore-house tea," which has there a wide and apparently well deserved reputation as a remedy in gonorrhœa—a decoction of the stems of the plants is used; and other not less interesting medical and edible plants.

All who would form their own opinions, uninfluenced by the noise of interested tradesmen, about the natural history and medical value of the botanical drugs of the Pacific States will find this volume a trustworthy and generally sufficient guide. It should be added that Dr. ROTHROCK has been assisted in its preparation by a number of other botanists, eminent in special branches of that science.

NOTES AND COMMENTS.

Value of Sea Weeds as Medicinal Agents.

There are not less than one hundred and three different species of marine algæ found along the New England coast. Dr. H. R. Storer, in an article in the Virginia *Medical Monthly*, observes that in these vegetable forms we have a hitherto unused means of assisting in the treatment of strumous diseases. He predicts that these neglected sea weeds will be found useful by the profession for a variety of indications, in the treatment of strumous disease. They may be used entire or comminuted, and hot or cold, as poultices. Crushed and soaked in sea or fresh water, they afford an easy and efficient form of medicated bath, general or local; and when they are treated understandingly by the pharmacist, we may expect that new and valuable preparations, to be recognized as such by the profession, will be obtained. Indeed, just as cod-liver oil of more worth than much of that in the market may be extracted from the fresh livers by any housewife, over her kitchen fire, it is probable that efficient infusions, etc., of algæ, of greater value than the much vaunted "sea-weed tonics" of empiricism, may be prepared in the same homely way.

Acetate of Lead in Internal Hemorrhages.

Large doses of acetate of lead are strongly recommended by Dr. Joseph Workman, of Toronto, Canada, in hemorrhage from the lungs and from the uterus after labor. He says, in an article in the St. Louis *Medical Journal*, the promptitude with which large doses excite uterine contraction has often surprised me; and this fact has been most noticeable when instant vomiting (which, however, is not a general occurrence), has been provoked. Some of my old pupils have told me they have given it in double, or even in treble the doses taught by me, and always with good, never bad, results. In profuse hæmoptysis, I have, within twenty-four or forty-eight hours, administered four, six or even eight drachms, without the slightest injury, and with signal hæmostatic success. Finally, I venture to say that pure acetate of lead, in *large* doses, is the surest and safest of all our medicinal incitants of post-partum uterine contraction.

Applications of Recent Inventions to Medicine.

The application of the microphone and telephone to diagnosis is interesting a number of observers both in this country and in Europe. Dr. Norris, of this city, has given the subject fruitful study, while at a recent meeting of a Scotch society Dr. A. Reith exhibited a specimen of a microphone attached to a telephone, which was in operation in the hall during the meeting. He had so arranged that five or six members could listen at the telephone at once. The experiments went far to prove that the microphone was a great advance in working the telephone, the articulation being much more distinct with it than with the telephone alone; although there seemed not to be any actual *increase* in the sound, but rather a diminution.

The electric light has also been successfully employed for surgical operations at night, and will soon be regarded as part of the equipment of a first-class hospital.

Examination of the Urine for Spermatozoa.

The plan recommended by Dr. Rouvier, in the *Gazette Hebdomadaire*, is to allow the urine to stand for twelve hours, adding benzine in summer, to prevent putrefaction; he then decants it and collects the flocculent precipitate. This precipitate is put into a test tube, ether is added, and the mixture is well shaken. In a few minutes the ether collects on the surface of the liquid as a gelatinous layer. The ether is removed by means of a pipette, and is placed in a conical glass, containing a small quantity of distilled water. All the spermatozoa in the urine thus tested are found in a very small compass, and each microscopic preparation will contain at least five or six in the field.

A New-Old Remedy for Rheumatism.

The common horse chestnut or buckeye, *Æsculus hippocastaneum*, has been brought forward anew by Dr. W. S. Drake, in the St. Louis *Medical Journal*, as a remedy in chronic rheumatism. He writes: I had an inveterate case of chronic rheumatism cured by the patient bathing in an infusion of buckeye. He had not walked for

nearly two years, and had gone through the whole routine of rheumatic remedies. While treating a horse with the infusion of buckeye, he found the swelling to rapidly disappear from his hands. He then applied it to other joints, and received the same benefit.

Correspondence.

FOREIGN.

Ed. Med. and Surg. Reporter:—

Vaccination is advertised as done free on four days in the week, Tuesday, Wednesday, Thursday and Friday, in Dublin. The vaccine issued from the Vaccine Department is of two kinds, (1) in hermetically sealed capillary tubes, and (2) on ivory points.

From the Adelaide Hospital trained nurses may be obtained to attend patients at their residences. There was established also, in 1866, the Dublin Nurses' Training Institute.

A peculiar feature of many of the charitable institutions over this side of the water is in their charging a moderate fee for medicine and attendance, the proceeds to aid in sustaining the charity. One dispensary requires all those receiving aid from it, sore paupers, to pay sixpence a month. This, doubtless, is a good thing, commanding a higher respect from those receiving aid, as well as helping to sustain the work.

Passing from Dublin, via Holyhood, to Liverpool, I arrived in this city early Wednesday morning, April 16th, and stopped at the Laurence's Temperance House, where, the proprietors say, John B. Gough found the only home-like house since leaving America. I took this all in, until I found English temperance houses have a great trick of using these same words. To them I suppose it is somewhat equivalent to a hardware man being "ironmonger to the Queen," etc.

A drug store in Liverpool, and in the kingdom generally, is a chemist's shop. The proprietor will not relish the term druggist—pharmacist will do, however. Open surgeries are very common. I had a very pleasant evening with the meeting of the Liverpool Chemical Association, at which I was introduced as being from America, and somewhat interested in pharmacy and in literary work, at which such a clapping and kicking were set up, to my honor, it was necessary for me to get on my feet and "make a speech."

During the reading of a paper on Anæsthetics, by Mr. Mason, it was said that ether was now used exclusively by American physicians. I corrected this statement, assuring them that the Gross's used chloroform exclusively.

Mr. Abrahams, who, by the way, is an honorary member, or a corresponding member (he says he does not know which), of the Philadelphia College of Pharmacy, asked me how the American dentists now give nitrous oxide gas. He understood it was always given from a black bag. I then gave a description of the present method of using it, as administered by Dr. J. D. Thomas and others, of Philadelphia. It is used here by the dentists almost exclusively in its condensed form. The Society gives its social coffee luncheon half an hour before "the chair is taken."

Dr. Richardson's local anæsthesia mixture was pronounced to be the very best article for this purpose. It is used in the form of a spray.

What seemed very strange to me was the showing of a self-inking printing press in a pharmaceutical meeting. It was shown as something new, and attracted great attention. Meaning no offence, I mentioned to the Society that just such a machine had been in use in America a number of years. The young gentleman in charge of the "novelty" sent forth sparks of fire from his eyes. The truth of the matter is, a British firm buys them in America and palms them off here as English made. Mr. Burrows, European agent, in London, for John Wyeth & Bro., was with me, and we took good care "to protect American interests." Several times each of us had "to defend our country and countrymen."

Dr. Symes, a pharmacist, showed me a specimen of shea butter, obtained from a fruit about the size of an orange, from Central Africa. It is used for much the same purpose as palm oil; melts at 84° Fahr; when strained looks like cocoa butter. It is used by the dock men, for rheumatism. Whether it is the rubbing or any special virtue of the article, he is not prepared to say. He thinks that many additions will be made to the drug list as Africa becomes opened. There is much dirt in this butter when it first comes here, which must be removed by straining. He has prepared a nice specimen of it for the museum. He urges upon the society the importance of having a specimen of all the drugs imported into this market in the museum.

The library of the Liverpool Chemists' Association numbers 648 books. Among them are several American works, such as Parrish's "Practical Pharmacy," etc. Several American journals are taken in.

For the week ending April 12th there were 247 deaths in Liverpool, 46 less than for the corresponding week of last year. The death rate is equal to 23.9 per 1000. 109 of these deaths were children below five years of age (the same old story of fearful infantile mortality), and 62 were infants below one year of age. There is a health committee in this city holding weekly meetings.

C. C. V.

Intestinal Obstruction from a Floating Kidney.

Ed. Med. and Surg. Reporter:—

Mrs. E., of Mississippi, visiting this place, the mother of nine children, 55 years of age, has had a floating lump in the right lumbo-iliac region for many years, but it never gave her pain until about the 8th of May. On that date she indulged in a hearty meal of corn and other vegetables for dinner. A violent attack of bilious cramp colic was the result, with repeated vomitings. Bowels were obstinately constipated, resisting injections and large and often repeated doses of active cathartics, for three days. The movable body became greatly swollen and tender within twenty-four hours after the attack of colic supervened. It occupied the right lumbo-umbilical region; size 3½ by 5 inches; it projected in front of

the ascending colon, just beneath the abdominal wall. At first it resembled a high ovarian tumor, or a forming abscess of the right lobe of the liver at the lower border; but a close examination excluded both of those organs as the seat of the tumor. We could also exclude intestinal accumulation from intussusception or mechanical obstruction; yet the mechanical pressure from the inflamed and enlarged kidney did obstruct the ascending colon completely for a time.

The treatment consisted first of free use of anodynes, viz., chloroform internally, morphia, etc., until the pain was subdued, followed by a full dose of calomel, castor oil, comp. cath. pills, injections, and with fomentations over the abdomen. This was carried out by Dr. V. R. Bridges, before I saw the case. Afterward active doses of comp. jalap powder internally, and locally iodine over the tumor every three hours, with fomentations, were continued. The bowels moved freely during the next twelve hours; pain and tenderness began to subside within twenty-four hours, as also the swelling, and within forty-eight hours, what appeared to be a threatening renal abscess (capsular) terminated rapidly by resolution and absorption.

It may be of some interest to many readers of the REPORTER to learn that such cases are sometimes met with in practice, and yet many physicians of half a century's experience may never have had their attention called to one with sufficient distinctness to recognize and diagnose it. Such tumors have generally been dubbed as phantom tumors, and passed by without a correct diagnosis. J. W. DORA, M.D.

Mattoon, Ill.

The Contagion of Diphtheria.

ED. MED. AND SURG. REPORTER:—

On the case of diphtheria reported by H. L. Getz, M.D., in the REPORTER of May 3d, allow me to remark that undoubtedly the child inhaled the poison by breathing the contaminated air of its mother's room. This is evident in view of the fact that the stage of incubation did not correspond with the theory of the disease being contracted in utero. Nor can we reasonably believe that the infant would receive the poison as readily, if at all, by the small quantity of nourishment necessary for its subsistence during the few days of its earthly existence, as it would by breathing the hot, vitiated air of the parturient's room, loaded as it must have been with the poisonous exhalations of the diseased mother.

I would further remark that in ordinary cases, where mother and child have diphtheria, it is best to permit the child to take the breast, for if we fail to administer medical relief through the maternal laboratory—it being intelligently supplied with proper agents—we cannot reasonably anticipate better results in the employment of a more artificial means of administering drugs. I have a case in mind where father and child were taken down with diphtheria; the child died, being two weeks old. The father recovered, and the mother, although confined in the same room with husband and child, did not have any symptoms of the disease. R. L. CALHOUN, M.D.

Parnassus, Pa.

NEWS AND MISCELLANY.

The Kansas Medical Bill.

An act to regulate the practice of medicine in Kansas was approved last February, and goes into effect June 1st, 1879. Its main provisions are as follows:—

SECTION 1. Every person in this State practicing medicine or surgery in any of its departments shall possess the qualifications required by this act. Every such person shall present his diploma to one of the boards of examiners herein named, together with affidavit mentioned in section four of this act. If the board shall find all the facts required to be stated in said affidavit to be true, the board of examiners shall issue its certificate to that effect, signed by a majority of the members thereof and sealed with the seal of the board, and such certificate shall be conclusive as to the rights of the person named therein to practice medicine and surgery in any part of this State.

SEC. 2. The Kansas Medical Society, the Eclectic Medical Society of the State of Kansas, the Homœopathic State Medical Society, shall each appoint annually a board of examiners, consisting of seven members.

SEC. 3. The boards of examiners shall organize within three months after the passage of this act. They shall issue certificates to all who furnish satisfactory proof of having diplomas or licenses from legally chartered medical institutions in good standing. They shall prepare two forms of certificates, one for persons in possession of diplomas or licenses, the other for candidates examined by the board. They shall send to the county clerk of the several counties of this State a list of all persons receiving certificates.

SEC. 4. Said board of examiners shall examine diplomas as to their genuineness, and if the diploma shall be found genuine as represented, the secretary of the board of examiners shall receive a fee of five dollars from each graduate or licentiate, and no further charge shall be made to the applicant; but if it be found to be fraudulent or not lawfully owned by the possessor, the board shall be entitled to charge and collect twenty dollars of the applicant presenting such diploma.

SEC. 5. All examinations of persons not graduates shall be made directly by the board, and the certificates given by the boards shall authorize the persons to practice medicine and surgery in the State of Kansas.

SEC. 6. Every person holding a certificate from a board of examiners shall have it recorded in the office of the County clerk of the county in which he resides, and the recording of the same shall be indorsed thereon. Any person removing to another county to practice shall procure an endorsement to that effect on the certificate from the county clerk, and shall record the certificate in like manner in the county to which he removes, and the holder of the certificate shall pay to the county clerk the usual fees for making the record.

SEC. 7. The county clerk shall keep in a book provided for that purpose a complete list of the certificates.

SEC. 8. Candidates for examination shall pay a fee of five dollars, in advance.

Sec. 9. Examinations may be in whole or in part in writing, and shall be of an elementary and practical character, but sufficiently strict to test the qualifications of the candidate as a practitioner.

Sec. 10. Each of said boards of examiners may, from time to time, adopt such rules as may be necessary to the orderly conduct of all proceedings taken and had before it. It shall be the duty of the secretary of the respective boards to notify the secretary of all other boards provided for under this act, of all applicants to whom licenses may have been refused, together with the reasons for such refusal of such boards.

Sec. 11. Any person shall be regarded as practicing medicine within the meaning of this act, who shall profess publicly to be a physician, and engage in the practice of medicine, or who shall habitually prescribe for the sick, or who shall append to his name the letters "M.D."

Sec. 12. Any person habitually practicing medicine in this State without complying with the provisions of this act shall be punished by a fine of not less than fifty dollars nor more than five hundred dollars, or by imprisonment in the county jail for a period of not less than thirty days nor more than one year, or by both such fine and imprisonment for such offence. And any person filing or attempting to file as his own the diploma or certificate of another, or a forged affidavit of identification, shall be guilty of a felony, and upon conviction shall be subject to such fine and imprisonment as are made and provided by the statutes of this State for the crime of forgery in the fourth degree. *Provided*, that no person who holds a certificate heretofore granted by either of the societies mentioned in the second section of this act shall be compelled to procure a new certificate, or be liable to any penalty for failing to do so; *and provided further*, that the provisions of this act shall not apply to those persons who have been practicing medicine within this State continually for five years prior to the taking effect of this act. When such persons have submitted proof of such continuous practice, as herein provided, a certificate shall be issued to them, as is provided for in section 3 of this act.

The Legal Relations of Color Blindness.

At the request of the Medical Society of the county, Dr. E. M. Sholl, of Gainesville, Ala., drew up and presented the following Act to the Legislature of Alabama. It passed its first reading, and was referred to the Committee of Ways and Means. A similar bill was presented to the Legislature of Tennessee, but it is not likely that either of them will pass. Nevertheless, as it may lead to concerted and successful action, we append the bill:—

An Act to protect the traveling public in the State of Alabama.

Whereas, It is a practically ascertained fact that a certain proportion of the human race are incurably color-blind, or unable to distinguish the difference between colors, particularly to determine red and green, the colors ordinarily in use as cautionary or danger signals, on railroads, steamboats and ships,

I. *Be it enacted*, therefore, by the General Assembly of the State of Alabama, now in session, that all railroad corporations doing business in the State of Alabama, all steamboats and ships plying in the waters thereof, shall subject all of their employees in any way concerned in the running, dispatching, signaling or guiding, or piloting thereof, to the practical color test, as to their ability to well and rightly distinguish between colors, and none shall be employed as above who cannot promptly and correctly distinguish the difference between colors.

II. *Be it enacted*, that the manner of test shall be that now commonly in use in Europe, the selecting of the different colors from the various shades of skeins of worsted. Time, place of examination, and examiner to be designated by the above specified railroad corporations, steamboat and ship proprietors themselves.

III. *Be it enacted*, that any failure to comply with the requisitions of this law shall subject said corporations or parties, in each instance, to a fine of not less than fifty, nor more than five hundred dollars.

IV. *Be it enacted*, that any damage to property, maiming or injuring of body, or loss of life, growing out of a failure to enforce Sec. I, shall subject the Executive and responsible parties of the above specified conveyances in Sec. I to such actions, pains and penalties, as in all cases are prescribed in the civil and criminal statutes of the State of Alabama.

V. *Be it enacted*, that this law shall go into operation on the 1st day of March, 1879.

The Yellow Fever at Port-au-Prince.

We learn from the Bulletin of the Surgeon General, Marine Hospital Service, that yellow fever is prevalent at Port-au-Prince.

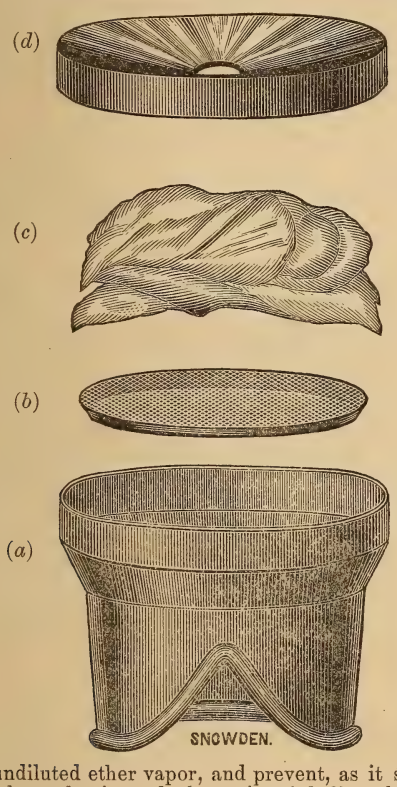
The State Department has received information that the fever also prevailed at Port-au-Prince fifteen years ago, but that since that period there has been no reappearance of the disease until now. In regard to the sanitary condition of Port-au-Prince, it is remarked by Minister Langston, that "the streets are constantly foul, and that not even police regulations of any sort are enforced." There is no regulation to oblige even the filthiest persons to remove deposits from the streets, nor from the gutters or sidewalks in front of their doors, and "the harbor is also full of foul matter of every sort." The fact of the existence of this mass of putrefying animal and vegetable matter, in one of the hottest climates, taken in connection with the absence of yellow fever from the city for the last fifteen years, furnishes presumptive evidence, at least, that deposits of filth alone, even when saturated with moisture and heated, are incapable of generating yellow fever. The fever which is apparently produced by the filth of the city, while quite fatal, is said to differ materially from yellow fever in all essential particulars.

—A Boston physician reported to the Board of Health that a certain woman's death was caused by consumption, Bright's disease and cancer. It was high time for him to lose that patient.

Dr. Hearn's Ether Inhaler.

This inhaler consists of an outer case of thin sheet metal, having the lower edge protected with a covering of rubber, to prevent its coming in contact with the face, as well as to exclude all air. Inside of this case (*a*) is fitted a screen of wire gauze (*b*), which is arranged so as to come about opposite the joint (*a*). The ether is poured on the lint or canton flannel (*c*), which is held in place between the wire screen (*b*) and the funnel-shaped top (*d*).

The object of this inhaler is to furnish an



undiluted ether vapor, and prevent, as it should when ether is used, the patient inhaling the surrounding atmosphere. The time required to produce complete anæsthesia, in ordinary cases, is from five to eight minutes.

Another object of the inhaler is economy; it rarely requiring more than two or three ounces of ether to produce its full effect, for which reason it is especially adapted to hospital use. The apparatus, by confining the ether vapor, prevents to a great degree the impregnation of the atmosphere in the room.

Personal.

—The chair of Theory and Practice in the Ohio Medical College, which was made vacant by the resignation of Prof. Roberts Bartholow, has been filled by the appointment of Prof. James T. Whittaker, who is transferred from the chair of Physiology in the same institution.

New Pharmaceuticals.

EXTRACT OF COFFEE.

The best extract of coffee we have seen is that manufactured by Wyeth & Bro., of this city. Coffee has many therapeutical as well as dietetic uses, and but few of the extracts in the market are suitable for either purpose. Of this of Wyeth Bros. we can speak with confidence.

LACTOPEPTINE.

The editor of the *Southern Clinic* reports very successful results from the exhibition of lactopeptine in cholera infantum. Such treatment is rational, and as the hot months are approaching, this suggestion should be borne in mind and acted on when occasion requires.

HORSFORD'S ACID PHOSPHATE.

It is well known that a deficiency of phosphates in the food impairs osseous growth. Lehman found, by experiments with pigs, and Chossat with birds, that it made a difference what kind of phosphates were used. Two pigs fed with phosphate of potassa had specifically lighter bones than others, which received with this salt phosphates and carbonates of lime.

As a means of introducing the phosphates in proper combination, Horsford's Acid Phosphate has been presented to the profession, and has been favorably reported upon.

The Duty on Quinine.

The note on page 462, on this subject, based on some remarks offered at the American Medical Association, requires a correction, which we cheerfully make. The actual duty on quinine is 20 per cent., ad valorem. The manufacturers' price in London last month was 11 to 12 shillings; the price at that time in Philadelphia was $3.60 per ounce. Hence the removal of the duty would have much less effect on the price than we stated.

We believe in cheap quinine; if it can be shown that removing the duty will not diminish the domestic supply of the article, let the duty be removed; but if it would have that effect, and place us at the mercy of foreign manufacturers, such a policy would be subversive of our best interests. The profession should study the subject carefully before committing itself.

Health Items.

The last report of the Surgeon General of the Marine Hospital Service states that advices from the Dardanelles, received under date of April 22, report the prevalence of scarlet fever. The cattle "Typhus," or "Lung plague," which last year destroyed seventy-five per cent. of the entire herds, has almost disappeared. It is said to have been introduced into the province by importation from Roumelia.

From Malaga it is reported that wine adulterated with fuchsine (one of the aniline colors, which usually contains either antimony or arsenic) has been seized at the Custom house. The Spanish Government authorities have directed that all wine, before being admitted, shall be submitted to an analysis at the custom houses at all ports of entry.

Action Against Adulteration.

On May 22d the House of Representatives' Committee on Manufactures agreed to report to the House for printing and recommittal a bill prepared by Representative Wise, of Pennsylvania, to provide for the welfare of the people in preventing the adulteration of articles of food and drink.

It imposes a fine and imprisonment upon persons manufacturing, selling or bartering any article of food or drink containing any ingredient or material injurious to the health of persons partaking thereof; and authorizes parties suspecting such adulteration to have samples of the article of food or drink analyzed, and if the fact is exhibited the corporation or individual shall pay all expenses attending such proceeding, and in case of refusal by a party to furnish samples of suspected adulterated articles he is made liable to punishment, etc.

It is to be hoped that this bill will be promptly passed.

Items.

—Some important modifications will be introduced into the Faculty of Medicine at Paris, on November 1st next. The annual examinations are to be suppressed, and the duration of the course of study is to be fixed at four years, and the hospital study to at least two years. The fees for the *aspirants au doctorat* are fixed at 1360 francs. At present, up to June 15th, students have the right of option between the new and the old systems. After November 1st, 1885, the new *régime* will be alone in vigor.

—Dr. J. Hilgard Tyndale informs us that he will open a sanitarium for the scientific treatment of consumptives about July 1st, 1879, at Manitou, in the southern part of the State of Colorado. This region has been selected, after careful consideration, as the nearest approach to an ideal resort for phthisical patients, as shown both by the meteorological reports and government surveys, and confirmed by personal observation and study of the climate and altitudes of various sections of the country.

—The New York State Pharmaceutical Association organized May 20th, with about a hundred members, and the following officers: President—P. W. Bedford, New York. Vice Presidents—S. C. M. Lyman, Buffalo; B. C. Ray, Utica; and A. J. Inloes, Binghampton. Secretaries—C. H. Gans, Albany; C. W. Holmes, Elmira. Treasurer—W. Blakie, Utica.

—Dr. W. Judah, of Guthrie, Ind., reports the birth of a healthy male child, weighing 9 lbs., but wholly devoid of upper extremities.

OBITUARY NOTICES.

—Dr. John McCulloch died at Huntingdon, Pa., May 15th. He was born in Juniata Co., Pa., November 15th, 1806. He read medicine with Dr. Ard, of Lewistown, and after attending two courses of lectures at the University of Pennsylvania, graduated in medicine in 1829. He located first at McVeytown, but shortly afterward went to Alexandria, Huntingdon county, and within a year removed to Petersburg. He remained at Petersburg, actively engaged in his profession, until 1852, when he was elected to Congress as a Whig, his opponent being Col. Emanuel Shaffer. At the expiration of his term, in 1855, he located at Huntingdon and pursued the practice of medicine until 1869, when, on account of failing health, he retired by taking into his office Dr. D. P. Miller.

—Dr. Charles Skelton, a highly esteemed citizen, died at his residence in Trenton, on the 20th ultimo, in the seventy-third year of his age, after several months' illness. He had been a member of the New Jersey State Legislature, and held many other public positions of honor and responsibility.

QUERIES AND REPLIES.

Dr. H. B. C., of Mo. The liniment is as follows:—

Iodine,	3 drachms.
Iodide of ammonium,	2 drachms.
Chloroform,	10 oz.
Olive oil,	10 oz.
Glycerine,	5 oz.

Dissolve the first two in the chloroform, by rubbing in a glass mortar, then add the others.

Dr. A. H. S., of Pa.—Koumyss can be had of several of the leading pharmacists of this city. Mr. McKelway, 1510 Chestnut street, prepares it.

Dr. S. C. V. A., of Mich.—Consult Agnew's *Surgery*, vol. I, p. 991.

Dr. F. G., of N. Car., desires information in reference to the *bromide of quinia* in hypodermic injections, for malarial cases. But little has been published on the subject, and we should like to publish the experience with it of any of our readers.

Kappa—The statement that the European races of this century are of greater muscular development and higher stature than their ancestors of the fourteenth century, as well as the contrary assertion that they have degenerated in these respects, rest on insufficient evidence.

MARRIAGES.

BAILEY—LOGAN.—In Carlise, Pa., May 13th, by Rev. W. H. Logan, W. D. Bailey, M.D., of Dillsburg, and Josephine F. Logan, of Carlisle.

GAGE—RILEY.—At the residence of the bride's parents, N.Y., April 28th, by Rev. W. F. Hatfield, Dr. Ruel Gage, of New York, and Miss Addie Riley, eldest daughter of Mr. John Riley, of New York.

HENRY—HUTSELL.—In Cincinnati, O., on the 8th ult., at 8.30 P.M., at the Gibson House, by Rev. Sylvester Weeks, Dr. Geo. F. Henry and Annie M. Hutsell, of Boyd Station, Ky.

DEATHS.

CHRISTIAN.—On May 14th, at 7.30 o'clock, P.M., in Covington, Ky., Dr. John F. Christian, in the 57th year of his age.

DENISON.—At his residence, in Fairfield, Conn., on Friday, 25th of April, Dr. Jeremiah T. Denison, in the 74th year of his age.

DOWLING.—In New York, on Wednesday morning, May 21st, Mamie, daughter of Dr. J. W. and Fannie A. Dowling, aged 11 years and 6 months.

FANNING.—In New York, on Sunday evening, the 18th ult., Ettie P., wife of Dr. W. A. Fanning, and daughter of Joseph Bryan.

THOMAS.—On the evening of the 16th ult., Isaac Thomas, M.D., in the 82d year of his age.

SYRUP-GLYCEROLE
OF
FERROUS CHLORIDE.

The Combination which all Forms of Iron must assume before Assimilation.

Superior to all other Iron Salts in that, while it is readily taken into the circulation, and does referruginate the blood, it does not ordinarily cause constipation nor headache. It is very pleasant to the taste, and is unalterable.

Ferrous Chloride is a neutral salt, consequently it has no action upon the teeth, and may be administered fearlessly. This fact and the delightful taste of my preparation render it an advantageous form for administration to children. Each fluid drachm contains one grain of Ferrous Chloride, which, owing to the certainty of its assimilation, is a full, active, adult dose.

McKELWAY, APOTHECARY,
Successor to O. S. HUBBELL.
1410 CHESTNUT ST., PHILADELPHIA.

WYETH'S
DIALYSED IRON.

(FERRUM DIALYSATUM.)

A Pure Neutral Solution of Peroxide of Iron in the Colloid Form. The Result of Endosmosis and Diffusion with Distilled Water.

PREPARED SOLELY BY
JOHN WYETH & BRO.,
PHILADELPHIA.

This article possesses great advantages over every other ferruginous preparation heretofore introduced, as it is a solution of iron in as nearly as possible the form in which it exists in the blood. It is a preparation of invariable strength and purity, obtained by a process of dialysation, the iron being separated from its combinations by endosmosis, according to the law of diffusion of liquids. It has no styptic taste, does not blacken the teeth, disturb the stomach, or constipate the bowels.

It affords, therefore, the *very best* mode of administering

IRON

in cases where the use of this remedy is indicated.

The advantages claimed for this form of Iron are due to the absence of free acid, which is dependent upon the perfect dialysation of the solution. The samples of German, French and American Liquor Ferri Oxidi Dialys. which we have examined give acid reaction to test paper. If the dialysation is continued sufficiently long, it should be tasteless and neutral.

Our dialysed Iron is not a saline compound, and is easily distinguished from Salts of Iron, by not giving rise to a blood-red color on the addition of an Alkaline Sulpho-Cyanide, or a blue precipitate with Ferro-Cyanide of Potassium. It does not become cloudy when boiled. When agitated with one part of Alcohol and two parts of Ether (fortior), the Ether layer is not made yellow.

Physicians and Apothecaries will appreciate how important is the fact that, as an antidote for Poisoning by Arsenic, Dialysed Iron is quite as efficient as the Hydrated Sesquioxide (hitherto the best remedy known in such cases), and has the great advantage of being always ready for immediate use. It will now doubtless be found in every drug store, to supply such an emergency.

Full directions accompany each bottle.

Physicians will find our DIALYSED IRON in all the leading drug stores in the United States and Canada.

It is put up in bottles retailing for **ONE DOLLAR**, containing sufficient for four months' treatment Large size is intended for hospitals and dispensing. Retail at $1.50. Price Lists, etc., sent on application.

Lectures on Experimental Physiology.

Delivered in the Physiological Laboratory of the University of Pennsylvania,

BY ROBERT MEADE SMITH, M.D.,

Demonstrator of Experimental Physiology.

(Reported for the Medical and Surgical Reporter.)

Lecture V.—Gastric Digestion.

(*Continued from page* 381).

Gentlemen:—Continuing our study of gastric digestion, we have to-day to finish the examination of the results of digestion in the stomach, and to take up the phenomena of secretion of gastric juice.

You saw that in the subjection of egg albumen to dilute acid, *all* the albumen was converted into syntonin, no proteid being found in the filtrate.

In the digestion of albumen by the gastric juice the result is different. You saw, when I neutralized the result of auto-digestion of the stomach, I obtained a precipitate of parapeptone or syntonin, but that all the albumen was not converted into this substance, because with Millon's reagent we still obtained evidence of a proteid in the filtrate. I will neutralize this specimen of artificial gastric juice in which fibrine has been dissolved, and there is a faint precipitate, not by any means the equivalent of the amount of fibrine originally present. I will filter off this syntonin, and the clear filtrate shows, with Millon's reagent, and by the xanthoproteic reaction, the presence of an albuminoid. What, then, is it that furnishes this reaction? You know that, as a class, the products of gastric digestion are called peptones. This, however, is a broad genus, containing several subdivisions and introductory products. In the order of their production, we have first parapeptone or syntonin, which I have shown to you, and which is precipitated from alkaline or acid solutions upon neutralization, being again capable of resolution in dilute acids.

According to the most recent views, this is merely an introductory product to gastric digestion, and ultimately nearly or completely disappears in its conversion into peptone.

In some experiments, however, which I have recently made on peptic-fibrine digestion, I obtained the reactions of A-peptone before any deposit of syntonin or parapeptone could be obtained on neutralization. The reactions of A-peptones were obtained after fifteen minutes digestion, in the warm bath at 40° C., of the fibrine in artificial gastric juice, made by adding a few drops of glycerine-pepsine extract of the dog's stomach to 100 cc. of H Cl. 0.2 per cent. And it was not until fifteen minutes more that a trace of syntonin appeared on neutralization, while the quantity of A-peptone, as measured by the density of deposit with nitric acid and potassium ferro-cyanide and one per cent. acetic acid, had then largely increased.

Part of the parapeptone was supposed to remain in the form of dyspeptone, which is spontaneously precipitated in a .2 per cent. acid. Its existence, however, is doubtful, as is also metapeptone. Peptones, however, are found in three forms. A,- B- and C-peptones. A-peptone is the first stage of conversion following parapeptone, and is recognized by the fact that it can be precipitated from its aqueous solution by

concentrated nitric acid and by potassium ferro-cyanide with dilute acetic acid. B-peptones follow a more prolonged digestion of A-peptones, and cannot be precipitated by nitric acid nor by potassium ferro-cyanide, unless with strong acetic acid, while C or true peptones are the ultimate destination of all proteids when subjected to gastric digestion. They cannot be precipitated by nitric acid or potassium ferro-cyanide, no matter what the strength of the acid.

Let us now see what is the form present in our solution of fibrine in the artificial gastric juice. We saw that there was a slight quantity of para-peptone. Let us now examine the filtrate, which, you remember, gave Millon's reaction.

I will first boil—there is no precipitate; I add nitric acid—still no precipitate; acetic acid and potassium ferro-cyanide—still with the same result, though it is possible that we may here obtain a sediment, when the mixture has stood for some time. We have then obtained *true* or C-peptones from the digestion of the albumen. They can be precipitated by tannic acid, silver nitrate, mercuric chloride, platinum chloride, and lead acetate. If, now, to another specimen of this same fluid I add liquor potassæ and a drop of diluted solution of sulphate of copper, I get a precipitate which dissolves on shaking, and forms a red solution. If too much copper is added, the solution becomes violet, instead of red. This, then, is another point of contrast with albumen, which, you know, under the same circumstances, gives a violet at once.

Decomposi ion of Fibrine in Peptic Digestion.

FIBRINE.

|

PARAPEPTONE OR SYNTONIN.
(Precipitated from dilute acid or alkaline solutions, on neutralization).

DYSPEPTONE (?)	METAPEPTONE.
(Spontaneously precipitated from dilute acid solutions.)	(Introductory to

A-PEPTONES.
(Precipitated by nitric acid, and by a mixture of dilute acetic acid and potassium ferro-cyanide).

B-PEPTONES.
(Not precipitated by nitric acid. Precipitated by strong acetic acid and potassium ferro-cyanide.)

C-PEPTONES.
(Not precipitated by nitric acid or potassium ferro-cyanide with acetic acid. Precipitated by tannic acid, mercuric chloride, silver nitrate, lead acetate and platinum chloride. With caustic potash and a minute quantity of sulphate of copper, forms a *red* solution.)

Having, then, studied some of the characters of the results of gastric digestion, as represented in tabular form, on the board, and the circumstances modifying them, I have now only to show you that the one end of all digestion, the fitting of nutritive materials for absorption, is accomplished in the stomach. Albumen is a colloid, and does not dialyse. Peptones are diffusible. I have here two small dialysers suspended in distilled water, one containing peptone, the other a solution of egg albumen. Peptones are found by the tests above enumerated in the water, but no trace of albumen.

Another question now arises for our consideration, viz.: in what locality are these two digestive factors, pepsin and the acid, separated from the blood. Are they both found together in all parts of the gastric glands, or does each possess a special situation for its secretion? I have here a pigeon, which I will kill, open immediately, and cut out the proventriculus, which is situated between the double crop above and the gizzard below. On laying it open and testing its inner surface with blue litmus paper, we have evidence of the presence of a high degree of acidity. I will now dissect off a portion of the muscular layer, thus exposing the ends of the peptic tubules, and on clipping off a shred of tissue, so as to contain the ends of several of these glands, and testing now the reaction, by squeezing the shred thus obtained between two pieces of litmus, there is obtained scarcely any decoloration. The reaction is neutral, or at most, faintly acid. We can, however, demonstrate the presence of pepsine in this fragment of tissue, by placing it in a test tube containing 0.2 per cent. H Cl., and placing it in the water bath, heated to 40° C., for an hour or two, when it will nearly all be digested. There is another way in which it can be demonstrated that the acid is separated solely on the surface of the stomach. About an hour ago I injected into the jugular vein of this rabbit a warm solution of half a gram of lactate of iron, dissolved in 6 cc. of water, and then gradually and slowly injected 1 cc. of a warm 10 per cent. solution of ferro-cyanide of potassium. You know that these two salts will unite and form Prussian blue only in the presence of a free acid. I will now kill the rabbit, by puncturing the medulla, and on opening the stomach and making sections of its wall, it is found that on the inner free surface of the mu-

cous membrane there is a dense blue coloration, more marked at the lesser curvature, while the deeper layers are unaffected.

The two salts have been prevented from uniting elsewhere by the alkalinity and albumen of the blood. I will harden a fragment of this gastric mucous membrane in alcohol, and I will be able next week to show you, by microscopic examination of the section, that the coloration is really confined to the free surface of the mucous membrane, and does not extend at all into the peptic tubules, thus showing that the acid is separated from the free surface of the mucous membrane.

On adding now a drop of sulphuric acid to the urine, which is alkaline, we get an instant blue coloration, thus showing both salts have been absorbed and eliminated by the kidneys, though prevented, through the alkalinity of the urine, from developing the Prussian blue.

As a supplement to what I showed you a few weeks ago, when speaking of the elective excretory function of glands, I may here show you that probably these salts of iron, which you remember I told you were with difficulty eliminated by the salivary glands, have not even now been secreted in the saliva, though, as you have seen, they have freely escaped by the kidneys. I will dissect out one of the sub-maxillary glands, and adding a drop of sulphuric acid, there is no Prussian blue found.

Finally, we may show that the free acid continues to be formed by the stomach for a certain time after death. If the stomach of a recently killed animal is cut into pieces, and washed in water, until an acid reaction disappears, and then left to itself, after a time the fragments will again become acid, and that, too, before fermentation could have set in, thus proving that the acid is formed by the action of the epithelial cells on the materials eliminated from the blood, and that that change may occur some time subsequent to that elimination.

While on this subject of glandular elimination, I may show you that certain other salts, in addition to the two which I have already shown you, may be eliminated by the gastric glands; you remember that while studying the salivary secretion I showed you that iodide of potassium might be eliminated by the salivary glands, while it escaped with difficulty by the kidney. This salt is also readily absorbed, and again eliminated by the gastric glands. The day before yesterday I injected through a tube passed into the stomach of this dog, in whom you saw me make a gastric fistula, two grams of the iodide of potash, dissolved in 30 cc. of water. Yesterday, on examining some of his gastric juice with starch mucilage and nitrous acid, I obtained marked evidence of the presence of an iodide; it was also separated, in a less degree, by his urine. I will now again collect some of the gastric juice, and apply the same test, with, you see, the result of the blue iodide of starch. This evidently must have been absorbed and again eliminated, since too much time has elapsed for the original injection still to remain in the stomach.

The influence of the nervous system on the secretion of gastric juice is in some way exerted through the pneumogastric nerves. The whole subject is, however, undecided, and although usually the stomach, flushed in digestion, becomes pale on section of the pneumogastrics, to again become red on irritation of their central end, the effect is not sufficiently constant to be demonstrated to you as one of the facts of experimental physiology. It would seem, however, from this experiment, that the vagus, by an afferent impulse, inhibits the vaso-motor center for the stomach, but the influence of nerves on the secretion of gastric juice is still unknown. It may occur after division of both vagi, both splanchnics, and even after extirpation of the cœliac ganglion. There are, however, one or two points, as regards the vaso-motor supply of the stomach, that I will probably be able to show you.

In a large rabbit, chloroformed and fastened on Czermak's holder, I will prepare the vagi nerves in the neck, in the manner with which you are familiar. The nerves being now isolated, but not divided, I will open the abdomen freely in the linea alba, from the xiphoid cartilage to the umbilicus, and thus expose the stomach, which you see is distended. I will now make a transverse incision through the skin alone, from the vertical incision to the left, parallel with the lower borders of the ribs, and extending outward about three inches. I will then introduce a large curved needle, threaded with a double ligature, into the abdominal cavity, protecting its contents from the point of the needle, and bring it out at the end of the transverse incision; then, upon slightly separating the ligatures and tightening them, the abdominal muscles are ligated in two points, and may be divided in the course of the original transverse incision, without hemorrhage. Upon now turning the stomach and intestines over to the right side, the abdominal aorta is seen as it comes through the diaphragm, giving off first the cœliac axis and then the superior mesenteric artery. In the angle formed by the aorta and superior mesenteric artery is

seen the almost transparent cœliac ganglion lying a little above this oval, yellowish body, which is the supra-renal capsule. Running into the cœliac ganglion is seen the left splanchnic nerve, which crosses the aorta a short distance above and then runs down on the left side, parallel with its trunk. I will carefully break through the peritoneum and loose connective tissue lying over these parts, isolate the left splanchnic and pass a thread around it. I will now irritate this nerve with a weak induction current, and you see the arteries of the greater curvature very sensibly contract, thus demonstrating that the efferent vaso-motor fibres of the stomach run in the splanchnic.

Allowing, now, the animal partially to recover from the chloroform, I make steady traction on the stomach in the direction of its length, with the thumb and finger, and the animal gives unequivocal signs of uneasiness. I now divide the vagi in the neck, and the same proceeding is followed by no result, thus showing that the vagi are the sensory nerves of the stomach. The stomach appears paler than before. The vagus, however, also contains *motor fibres* distributed to the stomach, for when I irritate the peripheral end of the divided vagus, after dividing the left splanchnic, the walls of the stomach begin to contract. This result does not invariably follow unless both splanchnics are divided, but as the section of the right splanchnic is considerably more difficult than that of the left, I have not taken the time to do it, and you see I have been fortunate enough to get marked motion with only the left divided.

Bile.

The next fluid which is poured into the alimentary canal after leaving the stomach is the bile, but since the major part of the knowledge that we possess of the bile relates to its chemical composition, and as I suppose you will go over that very thoroughly in your work in the laboratory for medical chemistry, I will have very little to say to you about it.

Most of the chemical and physical properties of the bile can be studied in the fluid obtained after death from the gall bladder, in those animals in which this reservoir exists, though certain modifications occur in its composition, such as the addition of biliprasin and an excess of mucin, from prolonged contact with the mucous membrane of the gall bladder. When, however, we wish to study the conditions of secretion of bile, we have to make use of biliary fistulæ. When it is desired to study the influence of different conditions, such as the action of drugs on the biliary secretion, the best method is to employ temporary fistulæ of the excretory duct. Dogs are the most suitable for this operation, which can be performed upon them with scarcely any difficulty. It is as well to have kept the dog fasting for several hours, at least, before the operation, as the gall bladder will then be full.

I will now make in this chloroformed dog an incision in the linea alba, about an inch and a half long, and about two inches below the xiphoid cartilage, tying each bleeding point before the abdomen is opened. On pushing aside, or tearing through the omentum, with the forefinger of the right hand, and carrying the finger well down below the liver, a dense band can be felt running from the liver to the duodenum, and consisting of the hepatic vessels, nerve and ductus choledochus. Hooking my forefinger under this band, and drawing it carefully and slowly forward, a blunt hook can be passed under it with the free hand, and the vessels drawn out of the wound; they can be prevented from retracting, by pushing the hook through, so that the vessels lie upon its handle, which rests transversely over the wound. The duct is then easily isolated and ligated near to its entrance to the duodenum, to secure the small blood vessel on its surface, and a canula inserted and bound in the duct. On removing the stilette from the canula, a few drops of bile immediately escape. Probably, however, a simpler method, and one less likely to wound the hepatic blood vessels, is to open the abdomen at the right margin of the right rectus muscle, and then follow the duodenum, which appears in the wound, and can be recognized by its large size and absence of mesentery, up toward the stomach, where the duct can be readily isolated and divided near to its insertion into the duodenum. Permanent biliary fistulæ can also be made quite readily in dogs, and have been undertaken, to decide the question as to the excrementitious nature of the bile. For this purpose the gall bladder is selected for the fistula, instead of the ductus choledochus.

The abdomen is opened in the median line, or preferably at the right border of the right rectus muscle, care being taken not to wound the large vessel which crosses the wound on the inner surface of the abdomen, and the common bile duct isolated as before; it is then ligated close to its entrance to the intestine, and at its junction with the cystic duct, and the intermediate portion excised. The fundus of the gall bladder is then drawn down and fixed in the edges of the wound. The operation may then be suspended until ad-

hesion has occurred between the walls of the gall bladder and edges of the wound, and the bladder then opened, or it may be treated in the same manner as in making gastric fistulæ, and a canula, similar to the one employed in the case of the stomach, inserted at once. In this mode of operation the object has been to exclude the bile entirely from the intestine; hence the excision of the duct; but Schiff has shown that less pressure is required to make the bile pass from the hepatic duct into the gall bladder than to force it through the common duct into the intestine. This excision, then, of the common duct is entirely unnecessary, apart from the fact that it sometimes fails its object by becoming restored, since as long as the cystic fistula is kept open the bile passes out of the wound, but when the canula is closed, it passes, as normally, into the duodenum. When this operation is successfully performed in dogs, either as detailed above or by excising the common bile duct, and all the bile allowed to escape externally, after a period varying from about two to eight weeks, the animals die, with signs of extreme inanition, though the appetite is preserved to the last.

The phenomena of the secretion of bile which at all admit of demonstration may be best studied in guinea pigs, in whom the bile is constantly poured out in large quantities. The operation necessary is very much the same as the one I have just described as best for making permanent fistulæ in dogs. Now that the animal is thoroughly chloroformed and fastened on the rabbit holder, I will open the abdominal cavity, in the linea alba, making an incison about an inch long, from the xiphoid process downward. The pylorus then appears in the wound, and upon making gentle traction the duodenum is brought into view, the loop, analogous to the superior transverse part in man, lying in the wound, with its convex surface directed toward the diaphragm, and receiving into its upper surface the ductus choledochus. I will now ligate the duct in this situation, and pass a pair of forceps immediately under the edge of the costal cartilage, when the gall bladder, which is always full, is seized with the greatest readiness, and a small canula, with an inner flange, inserted and tied in. I now sew the wound up, allowing the free end of the canula to remain outside of the body.

In our studies of the salivary secretion, we saw that the saliva was secreted at a greater pressure than that of the blood, but in the instance of the bile the circumstances of secretion are very different. Bile is always secreted at a low pressure, never even equaling that of the blood.

I will connect the canula inserted into the gall bladder with a small mercurial manometer, the proximal arm of which is connected with a pressure bottle about four feet above the level of the table, and which contains an aqueous solution of indigo-carmine instead of the soda solution usually employed in blood pressure experiments.

After filling the proximal arm and connecting tube with this solution, I will clamp the tube connecting with the pressure bottle, and you see that the two columns of mercury are nearly on the same level. Upon now connecting the manometer by a small tube, also filled with indigo-carmine, with the biliary canula, the mercury gradually rises in the distal arm of the manometer, until it attains an increase in height of fifteen mm., showing really that the bile is secreted under a pressure of thirty mm. of mercury, as, of course, the column falls in one tube in the same degree that it rises in the other. This appears to be its maximum pressure, as the column no longer advances, and you see how very much less it is than that of the blood.

I can now show you an example of the production of jaundice from obstruction. I will remove the clamp from the pressure bottle and the mercury immediately shows an increase of pressure equal to 40–50 mm. more of mercury, consequently the bile in the gall bladder is now not only subjected to this pressure of a column of mercury 75 mm. high, but also to the pressure of the column of water four feet high, a pressure very much greater than that under which the bile is secreted. The bile, therefore, in the gall bladder is reabsorbed, and if I now clamp the pressure bottle tube, you see the column of mercury gradually fall, though there is no escape of the fluids. Under the pressure of this column of mercury the indigo solution is gradually being absorbed by the guinea pig, and probably before the end of the hour the animal will die, under symptoms analogous to those produced by injecting large quantities of water into the veins, tremors, convulsions, etc., while the analogy to jaundice is still further preserved by the fact that the surface becomes colored blue by the indigo-carmine which was absorbed.

As regards the physiological function of the bile, little or nothing is known. That it is not entirely excrementitious has been proved in those instances in which its entire removal from the body has been followed by death, with symptoms of starvation; food being ravenously taken,

even to the last, and apparently digested, since there is no note of the food ever being found in the fæces, though in one instance (Flint) they are claimed to have contained an abnormal quantity of fat; its source, however, is somewhat obscure, since it is stated that the animal always refused fat food, even when ravenously taking lean meat.

The bile appears in some way to assist in the absorption of fats, since it has been found that after ligature of the bile duct an animal will absorb less fat than before, and that the chyle in the thoracic duct in these cases contained very little fat. It is doubtful, however, as to whether this property is due to the property possessed by the bile of forming a faint emulsion with oil or to some modification of the absorbing surface. Both views have been urged. I have here two small filters; one moistened with an aqueous solution of crystallized bile salts, and the other with water. Two hours ago I poured into each 5 cc. of olive oil, and you see that about 1 cc. has passed through the filter moistened with the bile salts, while none has passed through the other. Again, on shaking up equal quantities of ox gall and oil, I obtain an emulsion, probably solely due to the alkalinity of bile, which will stand for some time, though eventually separating.

Another point which increases the mystery attending the functions of the bile is, that it precipitates the results of gastric digestion.

I have here a specimen of artificial gastric juice in which a small quantity of fibrine has been digested, and I will add to one part a little fresh ox gall, and to the other an aqueous solution of the crystallized bile salts, with the production in each instance of a dense precipitate. This precipitate is generally acknowledged to consist of pepsine and of parapeptone, which latter, however, has not been thrown down by the neutralization of the fluid from the alkalinity of the bile, for my solution of bile salts is almost completely neutral, and you see that the supernatant fluid is still strongly acid. The pepsine may be shown to be contained in the precipitate by the fact that when the precipitate is filtered off, the filtrate, even when brought up to the proper degree of acidity, has no longer peptic properties.

I am now occupied with a series of experiments on the precipitation of the results of gastric digestion by bile, which I think will throw some light on this subject, but I have not yet got my results into such shape as would warrant my bringing them before you.

Communications.

FUNCTIONAL DISORDERS IN DIGESTION, PHYSIOLOGICALLY AND CLINICALLY CONSIDERED.

BY J. T. ESKRIDGE, M.D.,

Of Philadelphia.

Read before the Northern Medical Society of Philadelphia.

Few diseases present less charms of novelty, and still fewer are more practical, or require a greater amount of intelligent skill for their successful treatment, than those which head my paper for this evening.

When we remember their every day occurrence, the distress and annoyance which they cause, the often futile effort of the physician to give relief, the indifference or empiricism with which they are often treated, and the temptation of the unhappy sufferer to become the dupe of the nostrums and quackeries of the present day, it will not seem amiss for us to devote a short time to their consideration.

Dyspeptics are probably more numerous in this country than in Europe, and a careful study of our mode of living and cooking will afford a ready explanation. The causes of dyspepsia may, for convenience of study, be divided into predisposing and exciting. Without here mentioning the various causes, hereditation may, I think, be classed as one of the chief among the predisposing. The American people, for several generations, from their greed of wealth, improper cooking and irregular and hasty habits of eating, have overtasked and weakened the digestive organs, till at last they have dyspepsia, or a predisposition thereto, by hereditation. It does not require an imaginative mind to understand how dyspepsia may be influenced by hereditation; it follows the well-known principle, "like begets like." We know not only that deformities, disease and peculiar traits are transmitted from parent to offspring, but we also know that acquired defects are likewise propagated. Brown-Séquard,* after having produced epilepsy in some guinea pigs by injuring certain portions of their brains, found the disease to appear spontaneously in all the offspring of the diseased animals. Hæckel also mentions that a race of tailless dogs and calves appeared as the offspring of animals that had been accidentally or intentionally deprived of their tails.

It is common for many, instead of giving an hour for the leisure enjoyment of their dinners,

* Whittaker's "Elementary Lectures on Physiology."

to bolt them in from ten to fifteen minutes, and rush back to business; thus taking the blood to sustain their physical and mental efforts which should go to the stomach to carry material to aid in digestion.

Several different forms of functional dyspepsia have been described by various authors, but Ziemssen, in Volume VII, classes all forms of this variety of dyspepsia under the generic term of neuroses of the stomach, a term which, I think, is liable to mislead, unless we constantly bear in mind that the neuroses are only a part of the trouble, and often secondary in nature.

To understand what is embraced under the term functional dyspepsia, be it perverted function of the muscles, glands or nerves of the stomach, it is necessary to call to mind some points in the physiology of this organ. There are no grinding movements in the stomach of man, to aid digestion, as in some of the lower animals, but the muscular movements of the stomach are very important elements in this process, and when these movements are imperfect, great inconvenience results. At the cardiac end and along the curvatures of the stomach, there are numerous glands, whose function is to secrete a fluid which is particularly engaged in digesting the albuminous portion of the food, and at the pyloric portion more particularly, there are mucous glands* which secrete a fluid that has no active office in digestion, but this mucus becomes a great retarder of digestion, and indirectly of absorption, when too abundantly secreted. The fluid from the peptic or cardiac glands is acid, and is intermittingly secreted, while that from the pyloric or mucous glands is alkaline, and is constantly secreted. Thus we find the gastric juice during digestion to be acid, and during the intervals alkaline or neutral. The digesting power of the gastric juice is due to the presence of its peculiar acid, and the organic principle known as pepsin, neither of which can act alone. Many French physiologists contend that the acidity of the gastric juice is due to the presence of lactic acid, but the Germans contend as strongly for hydrochloric.

The stomach is supplied by the pneumogastric and sympathetic nerves. Experiments upon these nerves have not as yet enabled us to draw very definite conclusions in regard to their function in relation to digestion. So far as we know, irritation of the sympathetic will retard digestion, by contracting the capillaries of the stomach and lessening the blood supply; and paralysis of this nerve will cause engorgement of the mucous membrane of the stomach and over secretion of gastric juice. Experiments upon the pneumogastric give nearly opposite results, but, like those obtained from the sympathetic, these results are not always constant.

Mechanical irritation, alkaline fluids, as saliva, dilute alcohol, bitter tonics, etc., increase the flow of gastric juice, and those substances which interfere with fermentation, and suspend the power of pepsin, as metallic salts, concentrated acids, and alcohol, and regurgitation of bile, either retard the flow or action of the gastric juice.

For convenience of study, functional dyspepsia may be divided into atonic, pyrosis, bilious attacks, reflex and nervous dyspepsia. Time will not admit of speaking of any of these forms at a great length, but a few words in regard to the causes, main features and treatment of each will suffice.

Atonic dyspepsia manifests itself under two forms,* differing in nature and treatment. One is muscular atonicity of the stomach, and the other, faulty secretion of the gastric juice proper. By the muscular movements of the stomach, its contents are brought in contact with every part of its secreting and absorbing surface. If these movements do not take place, the gastric secretion is retarded in its action, because after the outer portion of the food is well saturated with the digestive fluid, its further action is hindered, unless by virtue of these peristaltic-like movements the digested portion of the food is absorbed, and this can only be accomplished by its being brought in contact with various portions of this mucous surface. Thus, it may be readily appreciated how muscular atonicity retards both digestion and absorption.

The chief cause of muscular atonicity of the stomach is rapidity of eating, which leads to gluttony and over distension of the organ, and in some cases to permanent dilatation of the same. It is for the most part a painless dyspepsia, differing widely in this respect from the other form of atonic dyspepsia caused by faulty secretion. Its

* In Küss' "Physiology," page 238, it is stated: those glands of the stomach (identical with Lieberkühn's glands) which have been called mucous glands, have thus been incorrectly named, the mucus not being a normal product, and no special gland being needed to produce it.

* Nearly two years after I began to take notes on these different forms of atonic dyspepsia, and several weeks after I began to prepare this paper, I read a short abstract of a paper on Atonic Dyspepsia, read by Dr. Leared before a medical society of London (see abstract of *American Journal of Medical Sciences* for Feb. 1879), taken from the London *Lancet*, Dec. 14th, 1878.

chief symptoms, which are acid eructations, escaping of gas, distension of the stomach, oppression at the cardiac region an hour or two after eating, in some cases finally relieved by vomiting, are readily appreciated, when it is remembered that the stomach is over distended by a mass of decomposing food, developing gas, irritating the mucous membrane, and causing a hyper-secretion of gastric juice, together with the acid developed by decomposition.

Treatment.—As rapid eating prevents us from recognizing when we have partaken of a sufficient quantity of food, leads to over-distension of the stomach, and atony of its muscular walls, so is the correction of this injurious habit essential in the treatment of this and all other forms of dyspepsia. Food of the most digestible nature should be eaten in small quantities several times during the day, and at no time should a large meal be indulged in. Many of the bitter tonics give temporary relief, but none compare with strychnia in the permanency of its effects. Its most happy effects are obtained when given in solution in a simple bitter tonic, or in Basham's mixture, a few minutes before eating. This is one of the forms of dyspepsia in which electricity and massage are used to good advantage. It is not my purpose to-night to give records of clinical cases to illustrate different forms of dyspepsia, but I now call to mind a number of instances where persons suffering from over distension of the stomach have been temporarily relieved in a few minutes, by gently kneading the gastric region. Electricity may be applied three or four times a week, and about ten minutes at each sitting, the positive pole over the stomach and the negative to the left of the spine.

Atonic Dyspepsia from Faulty Secretion.—The gastric secretion may be deficient in the acid, pepsin, or both; or the acid secretion may be too abundant. The cause of this faulty secretion lies in some malnutrition, or in an affection of the glands of the stomach. It occurs in persons of sedentary habits, or in those whose blood has been impoverished by hemorrhage or disease. Malaria and Addison's disease (including under the latter the so-called pernicious anæmia) will give rise to it, not only by impoverishing the blood, but also by producing atrophy of the peptic glands themselves. Hypertrophy or hyperæsthesia of the gastric tubules may give rise to an over secretion of the acid of the gastric juice.

Symptoms.—Given a case of atonic dyspepsia from faulty secretion, with our present knowledge of gastric digestion, unless further clinical experience shall enable us to determine, it will be difficult to decide, before testing by treatment, whether the pepsin or the acid is deficient.

The great symptom of deficient acid secretion is pain coming on some hours after eating, and is generally not relieved till the food has passed into the intestines, where it usually sets up a temporary diarrhœa. In these cases with deficient acid secretion burning eructations are sometimes troublesome. The patient becomes emaciated, both on account of imperfect digestion and the refraining from taking food because it gives pain. The following case seems to be a typical example of this variety, and, therefore, worthy of close study.

Mr. M., aged about thirty-three, a banker, spent his early years in agricultural pursuits, but for ten years has been leading sedentary habits; has suffered for about five years with cramping pains in the stomach, coming on after eating and passing off in diarrhœa. Bowels always irregular, constipation alternating with diarrhœa. During these five years he sought the advice of various medical men, and took numerous remedies, such as iron, quinia, strychnia, pepsin, etc., but obtained little relief, and was compelled to change from one drug to another, till at last he scarcely found anything that would make life tolerable. Finally the suggestion of some kind friend that he had cancer, made life a burden. He first consulted me in September of 1877, when I obtained his history as given above, with the expression, "I have not enjoyed a meal for five years." He had lost twenty or thirty pounds in weight, but there were no evidences of cancer, as shown by tumor, cachexia or vomit. On questioning him, I found he had taken almost everything likely to be of service, except the mineral acids. I ordered five drops of the nitro-muriatic acid three times daily, just before eating, systematic exercise, largely a meat diet, and a laxative only when compelled to use one. In a few weeks he wrote, "I have had no pain since I saw you, enjoy my steak without inconvenience, which has not been the case before for several years, and my bowels are opened regularly without the aid of purgatives." Thus he continued from September to January, without interruption. In January I requested him to discontinue his medicine for a while, to keep up systematic exercise with dumb-bells, walking, etc. In a few days I received a note from him, telling me he had to resume his medicine, as the first meal he had eaten without it his old trouble returned. From time to time I have requested him to decrease or stop his medicine for a while, but at no time has he been able to do without it and not suffer from

his former cramping pains. It has now been about eighteen months since he began with the acid, but still it seems just as essential to his comfort, and as effectual in digestion, as when he first began with it.

That we may have a form of dyspepsia from a diminution of the peptones in the blood, is in accord with the peptogenous theory of Schiff,* which has produced many practical results, and is further proven by clinical observations. Küss, reasoning on the physiology of gastric digestion, states that certain cases of sluggish digestion are due to the peptic glands not finding in the blood a sufficient amount of peptogenous material to impregnate them. "Schiff † mentions that 'some persons suffering from this malady were cured in a few days by taking soup an hour or two before eating a meal, or a draught of a solution of dextrine, or even an injection of the same, half an hour or an hour before taking food.'" I have been able to relieve or cure several cases of dyspepsia by having my patients take a little soup or milk between meals, and instead of eating two or three full meals daily, to eat a little six or seven times during the waking hours.

The treatment of this form of dyspepsia is simple, if we bear in mind the physiology of digestion, what things aid it, and what retard it, and secure the hearty coöperation of the patient to subject himself to a properly regulated diet for a sufficient length of time, without which no effort on the physician's part can give more than temporary relief.

Having secured the hearty coöperation of the patient, in many cases a little pepsin at meal time, with an occasional laxative, will suffice; in others the pepsin may be given just before eating, followed by a bitter tonic just after eating.

If there is a hypersecretion of the acid of the gastric juice, due to irritability or hypertrophy of the glands of the stomach, its effects are just the opposite of pyrosis or waterbrash, but its pathology and treatment are very similar. Waterbrash or pyrosis is due to a hypersecretion of the mucous glands ‡ of the stomach, which become irritable or hypertrophied. Its chief symptom is vomiting of watery, glairy mucus, before eating, and especially before breakfast, the fluid having accumulated in the stomach during the night. This condition interferes with digestion by the accumulation of large quantities of watery mucus, which dilute the gastric juice and prevent the specific action of the latter upon the contents of the stomach. Then follow a series of symptoms from the decomposing food, such as eructations of gas, acid fluid, distension of the stomach, etc. The most effectual treatment, combined with a properly regulated diet, is by astringents, an hour or so before eating, giving the astringent on an empty stomach, so that it may act directly upon the over-sensitive mucous glands. A host of astringents have been recommended—copper, sulphate of zinc, creasote, kino, nitrate of silver, bismuth, etc. Bismuth is often objected to by many, on account of its bulk, although it often does great good. On the whole, the most effectual treatment I have found is tincture of kino, in Huxham's tincture of bark, from fifteen to thirty drops of the former to a teaspoonful of the latter, from half an hour to an hour before eating. While carrying out this treatment other symptoms may arise, which will call for temporary measures for their relief.

Just a few words in regard to what are called "bilious attacks," or bilious dyspepsia. To rightly appreciate these attacks, and to treat them intelligently, we must keep in mind some of the best known functions of the liver, and the relation which this important organ bears to digestion and nutrition. In 1848 Claude Bernard discovered sugar in the liver; and in 1855 he demonstrated that the sugar of the liver is derived from a substance found in the liver, which substance, in 1857, he found to resemble in features those of vegetable starch. This substance stored up in the liver is called glycogen. The albuminous and starchy products of digestion are taken up mainly by the radicles of the portal circulation, and are carried to the liver, where they undergo important changes before reaching the general circulation. Both of these substances are more or less transformed into glycogen by the liver, in which it is stored up to be transformed into sugar for the nourishment of the tissues. Thus it is seen that the liver performs two important offices, one active, transforming and fitting the products of digestion for assimilation, and the other passive, acting as a reservoir, in which are stored up important and nutritive material. The tissues cannot appropriate more material than is required for their nutrition, and if a superabundance of food is partaken of, digested and absorbed, the circulation becomes too full, as shown by the slow, full pulse, sluggish feeling, both physical and mental, headache, etc.; and the liver is overtasked, which, by a provision of nature, is relieved by an overflow of

* Küss' "Physiology," page 242.

† Küss' "Physiology," page 243.

‡ See Küss' "Physiology," page 238, for contrary opinion.

bile from the liver into the small intestines, and this in turn sets up a bilious diarrhœa, or an attack of vomiting. These bilious attacks are brought on by excess of food, and are usually found in persons who are irregular in their habits of eating, especially as to quantity, and who only occasionally indulge in large meals, and at other times almost starve themselves by their over caution, lest another attack should be brought on.

Their nature suggests their treatment. Encourage nature in her efforts to get rid of useless material, but endeavor to induce her to carry it off by the stools rather than by vomiting. In the prodromic stage, free purgation will often prevent all the unpleasant symptoms of a bilious attack, and especially those by vomiting. Prevention is better than cure, so here regularity of eating is the only sure preventive.

Reflex or Sympathetic Dyspepsia.—Often the most aggravating forms of dyspepsia arise from disease in organs distant from the stomach. Typical examples of these are found in the multitude of uterine disorders occurring in the female, and to a less degree in the genital affections in the male. Imperfect sight from errors in refraction, not corrected by the proper glasses, will occasionally give rise to gastric disturbances. Often one of the first symptoms of congestion or inflammation within the cranium is intolerance of the stomach. Gall stones, piles, constipation, hernia and affections of the ear, teeth, kidneys, pancreas and liver will give rise to functional or reflex dyspepsia.

The nature of this class of dyspepsia, like the preceding, also suggests its treatment. I have been able to relieve a number of such who complained only of dyspepsia, by treating some distant organ, without any direct or special agents for the stomach.

Neuroses or Neuralgia of the Stomach.—I would define these to be excessive exaltation of the sensibility of the stomach, from special diatheses. Apart from those cases of gastralgia from organic disease, or disease in distant organs acting in a reflex manner, and giving rise to gastralgia, or those in which the pain is caused by some of the forms of functional dyspepsia already considered, I have not met with a single case of neuralgia of the stomach pure and simple. In other words, I have not met with a single case of this disease where I could not trace it from some cause other than a special diathesis. That there are such cases, the clinical observations of many fully attest, but they are rare. On the other hand, there is an immense number of cases secondarily neurosal, following debilitating influences, and among these may be mentioned those of a moral character, operating through the nervous system, as fear, grief, anxiety, or severe intellectual effort, abuse of stimulants, tea, coffee, anæmia and chlorosis.

Neuralgic, gouty and rheumatic diatheses, and the complex states expressed under the terms hysteria and hypochondriasis, may give rise to neuroses of the stomach, which are directly and almost purely neuralgic in their nature. The great symptom is pain, which is intermittent and disconnected with the taking of food. Sometimes we are only able to differentiate the pain from that occurring in other forms of gastralgia by its yielding to special anti-neuralgic remedies.

Treatment.—Rest for the stomach, tonics, astringents, anti-neuralgics, anodynes, and electricity applied as in atonicity of the muscular coat of the stomach. Rest is best obtained by rectal alimentation.*

*Since reading the above paper, my attention has been directed to rectal alimentation by injections of defibrinated blood in the rectum, by a paper recently read before one of the New York medical societies, a procedure which deserves further trial.

Medical Societies.

AMERICAN ASSOCIATION FOR THE CURE OF INEBRIATES.

The annual meeting of the American Association for the Cure of Inebriates was held at New York, May 20th, with a full attendance of superintendents of inebriate asylums and others interested in the treatment of inebriates. The President, Dr. Willard Parker, made an extended report of the Binghamton Asylum, indicating the bad management, from political interference, and the serious blunder of the State in attempting to turn it into an insane asylum. The city of Binghamton, which originally gave the land, now threatens to oppose the movement by law, on the ground that they donated it especially for an inebriate asylum, and it cannot be used for other purposes. This, with the suit of the stockholders against the State for its recovery, will, in all probability, take the building out of the hands of the State. In the meantime the asylum is in operation, with over forty patients. The most gratifying accounts of different asylums were presented. The organization of four new asylums during the year, and the demand everywhere for these institutions, to relieve both the prisons and insane asylums, was mentioned as a growing sentiment, wherever the subject was discussed.

The following papers were read and discussed at some length: "The Effect of Alcohol on the Offspring," by Dr. E. Chenery, of Boston; "Neurasthenia a Cause of Inebriety," by Dr. George M. Beard, of New York; "Practical Results of the Inebriates' Home, Fort Hamilton, N. Y.," by

Dr. T. L. Mason, Brooklyn, N. Y.; "Loss of Memory in Inebriety"—a medico-legal study, by Dr. T. D. Crothers, of Hartford, Conn.; "Inebriety and its Treatment in Europe," by Dr. Joseph Parrish, Burlington, N. J.; "Alcoholic Beverages and their Origin," by Rev. J. Willett, Fort Hamilton, N. Y.; "Our Position and Principles," by Dr. Willard Parker, New York; "Chloral Inebriety," by Dr. J. B. Mattison, Brooklyn, N. Y.

Many of these papers were of great interest, and opened up new topics and phases of the subject of inebriety.

From the report of the secretary, Dr. Crothers, the following extracts are made:—

The discussions of the effects of alcohol on society to-day are marked by a vague uncertainty and a changing restlessness, unnoticed before.

The increased publication of books, papers, and sermons, advocating many different theories and opinions, together with the temperance revivals which have sprung up in all parts of the country, enlisting the press, and rousing up the church, followed by organized societies pledged to carry on the work (all having one common purpose—the suppression of the evils following the use of alcohol), are the most significant signs of the times, and indicate clearly a great upheaval of opinion, to be followed by a wider comprehension of these evils and their remedies.

The establishing of inebriate asylums in the midst of opposition and credulity has gone on quietly in the wake of this continuous agitation, gathering friends and influence wherever the subject and its wants were realized.

The narrow prejudice and ignorant opposition have only served to bring out more prominently the principles upon which they are founded, and behind all the clamor and sneer there is an under current of facts (increasing every year) pointing distinctly to these asylums for a solution of the many problems of inebriety.

Of over thirty inebriate asylums established in this country during the past quarter of a century, only four have suspended and gone out of existence.

Considering that they were all experimental, and working without experience or precedent, and without the sympathy and coöperation of the public, their success may safely challenge comparison with any other charity of the age.

It is a well recognized fact that the asylum treatment of inebriety is more difficult than that of insanity, and had these asylums not met a necessity as imperative as quarantine stations for infectious diseases, or hospitals for the insane, they would have all failed long ago.

The early management of insane asylums was marked by many failures and imperfections, but the principles did not change. The conceptions of the work and the application of its principles may be wanting, but the necessity and value is the same.

The necessity of hospital treatment for inebriety is established beyond all question.

Within two years a very significant movement has begun, which is the commencement of a great revolution of public opinion in regard to asylums.

There has been opened in this country within this time over a thousand temporary lodging houses and eating rooms for inebriates—places where the poor, homeless victim, after he has signed the pledge, can be taken and cared for until he is able to go out sober, and help himself.

Some of these places have five or six beds, others less. Most of them are free. Some charge a few cents and trust the inebriate to pay. Many of them are connected with temperance coffee rooms, and are scarcely known. Some of the temperance eating rooms have the names of benevolent persons who will give a room and bed to any poor worthy inebriate who is making an effort to get well.

In these places they recognize the value of physical aid, and the necessity of food and rest, before the diseased will can be restored. The pledge is first given, then the physical wants are supplied. The comforts of home and food are furnished, either free or at a cost that is merely nominal, and often clothing is also furnished. Conversation, prayer, advice, the personal influence of some friend, watching and protection from old associations, and other temporary means, are employed.

Many of these places are managed by societies and reformed inebriates, others by women or churches. The Women's Temperance Union and the reform clubs seem to sustain the most of these places. In some cities single individuals are supporting little homes of this character, and the purpose of all—to shield and protect the inebriate—is one of the fundamental principles upon which inebriate asylums are based. Without any special notice, and almost unknown in the cities and towns where they exist, these initial asylums are rapidly forming public sentiment, and preparing for a larger and more enduring work in asylums properly organized.

The value of one day's restraint in these homes will bring the most positive proof of the greater good coming from a longer time, with more perfect care and attention.

If good food and quiet rest will help to overcome the diseased impulse, it is only a step to realize the value of months of such surroundings, and the possibility of permanent recovery.

These homes are rapidly increasing, and following the track of the great revivals, and they are literally the first efforts of the masses to treat inebriety by rational means. From every one will go out an influence that will far transcend the individual good they can accomplish.

This is undoubtedly the beginning of a great inebriate asylum movement, which shall provide hospitals and homes for this class.

The public are ripe for some practical methods of reaching this disorder. A small number of asylums are at work, like the videttes of an advancing army. Practical men, both in and out of these asylums recognize the possibility of making all this vast tide of inebriety support itself in hospitals sustained by law and public sympathy. All the indications are unmistakable, that behind this noise and confusion will be seen the reign of law and growth of homes and hospitals that shall meet the demand of the inebriate. The medical profession are also agitating this subject, and from all sides come the most cheering proofs that the work of our Association is scarcely begun. * * *

The following officers were elected for the coming year: President, Dr. Willard Parker, New York city; Vice presidents, Drs. Albert Day, of Boston, and B. N. Comings, of New Britain, Conn.; Secretary and Treasurer, Dr. T. D. Crothers, Hartford, Conn.; Secretary for Foreign Correspondence, Dr. Joseph Parrish, Burlington, N. J.

This association meets in New York city, semi-annually, hereafter, and is doing a very important work.

KANSAS STATE MEDICAL SOCIETY.

The thirteenth annual meeting of this Society convened at Atchison, May 14th, nearly 300 members being present. An address of welcome was delivered by Hon. B. P. Waggener, who was responded to by Dr. C. C. Furley, President, who also delivered the annual address, which was an outline of the history of medicine from the dawn of time until the present era. He traced the progress of medicine from the time it was a superstition until it became a science, the Greeks being the first to throw off the shackles of superstition, until Hippocrates wrote the famous sentence "Nature is the first of physicians." The progress of the healing art was then followed, century by century, until the thirteenth and fourteenth, when great progress was made, and in 1315 Mondeni de Luzzi, for the first time for seventeen centuries, dissected a human subject before a class of pupils. Discovery then followed discovery, till in 1619 the great Harvey made known the mechanism of the circulation of the blood. War, a great evil, yet worked for good in the development of surgery. Then came the illustrious Edward Jenner, with the discovery of vaccination, and the medical roll of fame bore the name of John Hunter. A brief allusion was made to the progress of medicine in the United States, and the roll was called of the illustrious Americans who have labored for the good of their profession and of mankind.

Dr. Furley was followed by Dr. Tiffin Sinks, in an address on public and private sanitation. He observed that, great as are the ravages of the thousand forms of accident, of intemperance and of violence, the greatest scourges are infectious and contagious diseases. The plague, for instance, in the fourteenth century swept away 70,000,000 of people. "Humanity underwent a total revolution; society became disorganized; the planet was delivered over to a chaos of terror, superstition, crime, pain, pestilence and death." After five centuries we might expect better things, but the history of the yellow fever in the South last summer sounds like the story of the plague. The instinct of self preservation is as strong as ever. The speaker here introduced a powerful contemporary description of the South during the pestilence, "when the strongest ties of nature snapped in the fever, like strings of tow in the flame." In the midst of universal panic, however, the physicians, as a rule, remained at their posts, and three hundred of them died there.

Reports of committees were called for, and Dr. J. B. Gish, of Valley Falls, read a paper on "Recent Advances in Chemistry." Dr. Gish's paper gave an account of several new metallic elements discovered within the last ten years. The results of recent chemical analysis, throwing light on the process of digestion, were spoken of. Dr. Gish mentioned the rising interest in sanitary science and the progress made in the discovery and use of antiseptics. The paper was referred to the Committee on Publication.

Dr. Fryer, U.S.A., read an elaborate paper on "Recent Advances in Ophthalmology. Dr. Fryer spoke at some length of the uses of eserine, the active principal of the Calabar bean. Some improvements in operations for cataract were described.

A number of names were reported by the Board of Censors, for admission as members.

Dr. Fryer exhibited a self-retaining attachment to Sim's speculum, invented by himself, and explained its method of application.

Dr. Carpenter, of New Lancaster, Miami county, read a practical paper, singularly devoid of medical technicalities, in regard to the use of plaster-of-Paris bandages in cases of fracture. Notes of several cases in the vicinity of New Lancaster were given. Dr. Carpenter explained that his views were presented for the benefit of country surgeons who had not at hand the array of splints, etc., at the command of the city practitioner. Referred to the Committee on Publication.

The Society adopted, without debate, the following:—

Resolved, That the Kansas Medical Society disapprove and condemn the use of copyrighted pharmaceutical preparations.

Dr. C. V. Mottram, of Lawrence, read reports on a case of dislocation of the hip joint, which was reduced after four months' standing; and a fatal case of aneurism of the aorta, illustrated by a specimen.

Dr. Morris, of Lawrence, read a paper on a case of puerperal insanity. The patient was successfully treated with chloroform, bromide of potassium and hydrate of chloral. A case of puerperal convulsions was similarly treated, with good results.

Dr. Daugherty, of Junction City, read a paper on "Parasites," a subject which Dr. Daugherty described as "attractive." The paper was illustrated by several beautiful tapeworms.

Dr. Daugherty, in response to a question as to his treatment, stated that at nine o'clock he whooped up the worms with two ounces of turpentine and half an ounce of castor oil; at eleven o'clock the first attack was followed by three ounces of turpentine in mucilage of gum arabic, and at twelve o'clock the worms were in full retreat.

At this report the Society manifested great enthusiasm.

Dr. W. S. Tremaine, U.S.A., then took the platform, and partly reading and partly talking, described several new surgical instruments and appliances, and entered into a description and illustration of the Lister antiseptic treatment of wounds, familiarly known as "Listerism," which subject he has made a careful study in his practice as an army surgeon.

The Committee on the Medical Law recommended that the Board of Examiners be appointed a committee to report any desirable alteration in the act under which they are appointed, at the next meeting of the Legislature.

A stirring discussion of the law sprang up, and continued for at least two hours. A variety of opinions were developed.

Dr. Shean and others thought the law contradictory and meaningless. He would risk all its penalties.

Dr. Fryer was in favor of postponement and taking legal advice, and if the law could be evaded, he was in favor of evasion.

At last, after many motions and much talk, a vote was reached on the motion accepting the report of the committee, appointing the board of examiners, and it was carried, 60 to 41, so the law was accepted.

On motion of Dr. Tremaine, a committee was appointed to present resolutions expressive of the sense of the Society as being condemnatory of the law in its present shape.

The Society then listened to a paper by Dr. Halderman, on puerperal convulsions.

The Committee on Nominations made the following report, which was adopted:—

For President, C. C. Furley; Vice Presidents, J. H. Stuart, J. M. Linley; Secretary, F. D. Morse, Ass't Secretary, W. B. Gibson.

Board of Censors, J. F. Neely, M. R. Mitchell, Dr. Jacobs, James Haller, P. Daugherty.

On the next and last day, after some general business, Dr. McCully read a paper on yellow fever. He began by saying that it was a mistake that yellow fever always had been, and in consequence always would be, confined to a southern latitude. It had once existed in Connecticut; at one time it devastated Philadelphia, and some day it might prevail in Kansas. His first experience with the disease was at Key West, in 1864. The island is not subject to malarial diseases. The disease broke out in Fort Taylor in May. It was discovered that a sewer leading from a vault to the moat of the work had become closed. Twenty-four men were detailed to clean out the sewer. All were attacked by yellow fever, and in a short time seventeen were dead. He investigated the subject of the effect of race. There were colored troops raised in the District of Columbia, and a white regiment from New York. Both white and colored took the fever, but the mortality was much the greatest among the whites. Acclimatization was not a protection. Gen. Woodbury, the commander of the post, who had lived long at Key West, died of yellow fever. He had no doubt the disease spread by contact. Men who came into Key West were attacked by the disease. Places not quarantined to Key West were affected. He made eighteen *post-mortem* examinations at Key West, and in all cases found fatty degeneration of the tissues and enlargement of the spleen. After his experience at Key West, he saw the yellow fever again at Havana. At Memphis he again witnessed its ravages. He deserved no credit for courage, for he had no cause for fear. He had had yellow fever at Key West, and did not expect to have it again. In his opinion, yellow fever belonged in the class with scarlet fever and smallpox, where one attack is the rule. He had abundant evidence of this fact. The mortality, he believed, was increased by the treatment. Blanketing, sweating and purging were all wrong. Dr. McCully did not go into the details of his treatment, but it was gathered that he had found milk and lime water and injections of quinine beneficial. He spoke highly of the devotedness of the Southern physicians. They had protested against the sanitary condition of the Southern cities before the epidemic came. The result in Memphis was the triumph of scientific medicine. During the last three weeks of the fever there was not a homœopath or eclectic in Memphis. When suitable medical attendance was secured, the disease yielded to control. Science could have prevented the disease; science certainly checked it. The North displayed a noble generosity, but the spirit which led northern men to visit the infected district was a mistaken one. They could do no good, and added to the number to be taken care of. The Southern physicians welcomed real aid from any source. A colored physician came down from Cincinnati. He was welcomed; was set to work, was remarkably successful, but finally fell a victim to the fever. The speaker was confident that the gratitude of the South was deep and lasting, and that to be a northern physician was to hold a passport to the best society of the South.

At 12 o'clock, noon, the thirteenth annual session of the Kansas State Medical Society adjourned.

The Antiseptic Treatment of Hepatic Abscess.

Dr. W. C. Maclean, Professor of Military Medicine in the Army Medical School, Netley, writes to the *British Medical Journal*—

Private Thomas Debell, Fourth Hussars, aged thirty-nine, twenty years' service, of which seven were spent in India, was invalided from India, and admitted into the Royal Victoria Hospital, Netley, on May 10th, 1878. He had suffered from primary syphilis in 1865, for which he was treated with iodide of potassium and mercurial fumigations. In 1870, he had repeated mild attacks of ague at Meerut, followed by syphilitic rheumatism. In 1871, he was sixty-three days in hospital, according to the medical history sheet, for "Bright's disease, cause unknown." There is, however, reason to believe that the symptoms which were supposed to indicate Bright's disease were in reality due to injury to one or both kidneys, the result of a heavy fall on his back from his horse. No symptoms of Bright's disease, nor any affection of the kidneys, were present on admission. He was invalided for the results of this accident, and sent home, arriving

at Netley in April, 1872, well and fit for duty, and at once sent to his depot, and, after a time, returned to his regiment in India.

In March, 1878, he had what he describes as a slight attack of dysentery, from which, on embarkation for England, he was convalescing. During the voyage, while on night duty, he slept on deck, was chilled, and suddenly seized with acute pain in the hepatic region, with rigors and vomiting. The following was his condition toward the end of May: He was emaciated; his tongue was clean; no diarrhœa; appetite bad; morning nausea. He was very restless, sleeping badly, yet his spirits were always good. Morning temperature 100°; evening, 101 to 102°, F. Pulse 80 to 90. The cardiac sounds were normal. Cough was troublesome at night; there was slight crepitation at the base of both lungs. Hepatic dulness in the mammary line extended from the sixth rib to within two inches of the crest of the ilium. Just below the cartilage of the ninth rib there was a well-defined prominence, four inches in diameter, extremely tender, but without fluctuation. There were, in addition, general hepatic pain, and impatience of palpation over any part of that region; and the superficial veins on the right side of the abdomen were prominent.

On June 6th an unsuccessful attempt was made to evacuate an abscess, the existence of which was diagnosed, with an aspirating needle. No pus was found, but rather more than half an ounce of blood was withdrawn by the exhausting syringe. For two days the patient experienced considerable relief of the local symptoms from the operation. Soon, however, diarrhœa and night sweats set in. It was then determined to operate again, this time according to the antiseptic method. The operation was performed by Surgeon Major Porter, Assistant Professor of Surgery, the patient being under the influence of ether, a powerful steam-generated carbolic spray playing on the part. An opening was made with a full-sized trocar between the ninth and tenth ribs. Twelve ounces of thick, creamy-looking pus having been withdrawn, a drainage tube was introduced and secured in the usual way; the part was dressed with carbolized gauze and tow, and secured with a carbolized bandage, according to Mr. Lister's method, the spray playing until the dressing was completed. At every subsequent dressing, the same method was carried out with scrupulous care, so as to avoid the entrance of uncarbolized air, and the discharge was received in the carbolized dressings.

It is not necessary to give the details of the case further than to say that the case progressed favorably, and that, notwithstanding the great heat of the weather, the discharge continued free from every trace of mal-odor to the last. Some difficulty was experienced in introducing fresh drainage tubes, owing to contraction of the wound, which was overcome by careful dilatation with bougies. During treatment, the patient was troubled by a return of syphilitic rheumatic pains, which were relieved by iodide of potassium in full doses. On August 25th the tube was withdrawn, the wound, however, being still dressed with carbolized lint. By the end of August the wound was quite closed, all pain and tenderness on pressure had ceased, his general health was good, his temperature was normal, he had gained flesh, and was able to make himself useful to patients in the ward. The liver was greatly reduced in size, in fact, in all directions, little exceeding its normal limits. Having completed his time of service, he was finally discharged "to pension," in very good health.

The Medical Use of Cinchona.

Some rules for using cinchona and its alkaloids are laid down by Dr. H. M. Field, in the *Transactions* of the Vermont State Medical Society. Premising that there are but two general contraindications to its use—a disposition to cerebral congestion or to intestinal inflammation—he recommends these directions:—

Immediately after the paroxysm, eight grams of cinchona, or one gram of quinia; one day's interval, and then the same dose; two days' interval, same dose; three days' interval, same dose; four days' interval, same dose. If the medication be stopped at this point, relapses are to be feared; it is wise, therefore, henceforth, to pursue Bretonneau's plan, and repeat the dose successively, after the last day of medication, upon the 10th, 15th, 20th, 25th and 30th days. So much for the general principle; but various modifications can be introduced at the will of the practitioner, in the use either of the *single* or the *continued dose;* or as demanded by the type of the seizure, if it be quotidian, quartan or whatever. In severer cases the remedy has more immediate power if given all in one portion, or in two parts after a few hours' interval.

The intervals as proposed by the scheme advised have a double significance and value; for where the quinia is taken daily, even in comparatively small doses, there is danger either of causing irritation of the stomach, which may then refuse longer to receive the remedy, or that the patient will get so accustomed to it it will have lost its therapeutic power. In this latter event an unexpected return of the fever finds us at great disadvantage. Hopelessly involved are those cases—happily very rare—where from neglect of this caution and steady persistence in the exhibition of large quantities for a considerable time, together with exceptional obstinacy on the part of the disease, the phenomena of morbid poisoning and therapeutic poisoning become inextricably blended. There are few conceivable conditions so unfortunate for both physician and patient.

In pernicious fever a different plan must be followed; the dose as just estimated must be doubled or trebled, and we cannot safely, as in an intermittent, wait for the intermission. Too often no complete intermission is granted, and we must choose the epoch when the accidents of the preceding paroxysm begin to abate a little, or the period of remission. Here medication must be heroic; the doctor who hesitates is lost, and loses his patient. In this emergency he must take command as the "master," rather than serve as the "minister of nature." Truly has Lauter said that if ever the physician is arbiter of life and death, it is in pernicious fever. The im-

portant bearing of hypodermic medication upon this variety of disease has been already remarked.

Reviews and Book Notices.

NOTES ON CURRENT MEDICAL LITERATURE.

——"*The Country Practitioner, or New Jersey Journal of Medical and Surgical Practice,*" is the title of a new periodical, published monthly, at Beverly, N. J., by Dr. E. P. Townsend, at $2.50. It is neatly gotten up, and has a fair promise of life. We note that on page 22 the editor quotes from a writer in the Reporter this sentence: "It has been remarked that probably veratrum viride has never been given to a patient who would not have been as well off without it;" and adds his own comment, as follows: "This remark was probably not made by a physician; if so, his powers of observation must have been exceedingly limited." If Dr. Townsend will turn to the *National Dispensatory*, under *Veratrum viride*, he will find that this remark is made by Prof. Alfred Stillé, M.D., LL.D., except that Dr. Stillé writes that the patients would have been "better off" without this drug.

——The Proceedings of the Southern Illinois Medical Association, held at Centralia last January, form a neat pamphlet of eleven pages. Only the minutes of the meeting are inserted. The publication committee announce that, after mature deliberation, it has seemed best to publish only the minutes of the annual meeting, reserving the papers submitted till after the semi-annual meeting, when they hope to be enabled to publish the transactions of the annual and semi-annual meetings in one volume, which will be a credit to the Society, both at home and abroad.

——The third part of the Atlas of Histology, by Dr. Klein and Mr. Smith, is occupied with elastic tissue, adipose tissue and cartilage. The colored plates are beautifully executed, and quite a pleasure to look at.

BOOK NOTICES.

Diseases of the Throat and Nasal Passages. A Guide to the Diagnosis and Treatment of Affections of the Pharynx, Œsophagus, Trachea, Larynx and Nares. By J. Solis Cohen, M.D., etc. Second edition. Revised and amended. With 208 illustrations. New York, Wm. Wood & Co., 1879. 8vo, pp. 742.

This large work, printed on fine paper, in good style, and abundantly illustrated, must long remain the leading American monograph on the important subject of which it treats. Seven years have passed since the appearance of the first edition, and during that time the author has lost no opportunity to add valuable matter from his wide experience, to the text of his book. Comparing it with the work of Browne, published in London last year, we must give the American monograph an easy superiority to that artistic production.

The scope of the work is so fully stated in the title given above, that we need not present an analysis of its contents. The bibliography of the subject is omitted in the present edition, but the numerous references and the very full index, with the names of authors, amply make amends for the omission. The cuts are largely of instruments and of the laryngoscopic image in various diseased conditions. Some of them are new, the majority have already appeared.

Of the topics treated many readers will first turn to the chapters on croup and diphtheria. They are learned and thorough. Dr. Cohen considers them different diseases, requiring different treatment. His summary of the practical questions relating to them indicates large personal experience as well as extensive reading. The same has impressed us in examining the presentation of the various syphilitic affections to which the parts he has under review are liable. Indeed, the work, as a whole, will be sure to give satisfaction.

Fistula, Hæmorrhoids, Painful Ulcer, Stricture, Prolapsus, and other Diseases of the Rectum; their Diagnosis and Treatment. By William Allingham, F.R.C.S., Eng., etc. Third edition. Phila., Lindsay & Blakiston, 1879. Cloth, pp. 325. Price $3.00.

Mr. Allingham's work needs no introduction. Two editions have already been sold in this country, and as many in England. For years it has been regarded as one of the best monographs on the rectum in our language. The present edition has been largely re-written, and the author informs us that he has in various respects modified the opinions he advanced in his previous issues. The work has also been enlarged by a more full discussion of various points. We have perused with much interest his experience in extirpating the rectum for cancer. His reports do not tell very strongly in favor of this hazardous and difficult operation.

It is to be noted that the book is not provided with an index. This is an omission which is inexcusable in these days of much reading.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	$5.00
Half-Yearly Compendium of Med. Science,	2.50
Reporter and Compendium, - - -	7.00
Physician's Daily Pocket Record, - -	1.50
Reporter and Pocket Record, - - -	6.25
Reporter, Comp. and Pocket Record, - -	8.25

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

D. G. BRINTON, M.D.,

PHILADELPHIA, PA.

THE ENGLISH MEASURES FOR CONTROLLING PROSTITUTION.

The continued efforts made by the association of persons in England who have in view the repeal of the Contagious Diseases Acts, so far as they relate to the control of prostitution, have led to another official examination of the results of enforcing the Acts. The report has not yet been made, but, undoubtedly if it is from unprejudiced observers, it will show that venereal diseases have been diminished, the number of prostitutes lessened, their health bettered, and many young girls saved from following this unfortunate career.

Such are the results which unbiased medical observers who are in the most favorable position to be correctly informed have unanimously stated to have been brought about. There is not a single medical journal of prominence in Great Britain but that is in favor of these Acts; there is not a single physician or surgeon who deserves to be ranked among the leaders of the profession but who is in favor of them.

The opposition comes from clergymen, from hobby-riding philanthropists, and from women whose emotional nature is too strong for their reasoning faculties to have fair play. Not all women, however, are to be classed in this category. One of them, Mrs. Hoggan, at a recent meeting to further the repeal of the law, actually had the nerve and good sense to say, in reply to those who alleged that the medical examination of public women was an outrage on the liberty of the subject—

"It is agreed that the compulsion exerted here is the grievance, but it seems to be forgotten that the women in question are exercising a lucrative trade, which, to respectable women, is repulsive beyond the power of words to express, but which, in the majority of cases, is not repulsive to themselves. In as far as it is a trade which may spread disease, these carriers of disease naturally fall within the jurisdiction of good government, just as persons carrying on offensive trades, such as chemical works, are likewise placed under control, and they have, therefore, no claim to escape control of a reasonable nature, and to injure with impunity the health of the community."

These are the words of a woman who is brave enough not to be ashamed of her common sense. These Acts are undoubtedly a misfortune in the sense that they are necessary, but it is a libel to say that they are immoral. All the machinery for good, all the practical philanthropy, all religious schemes, have failed to extinguish the evil. The law has come in to help the most earnest workers, not to supplant them. Its object is to deal with and, at least, to diminish a terrible disease, and to assist in the rescue of the fallen; and so far as it aims at and achieves these purposes it deserves support, not only on scientific grounds, but on those of the highest morality and of religion.

While the profession in Great Britain is thus practically unanimous in the support of these Acts, we cannot but refer with regret and shame to the lethargy or cowardice of the profession of the United States. Afraid of the clamor of the "unco guid" and the sentimentalists, they have avoided this question of the registration and supervision of prostitutes. Although ample evidence is before the world that sin and suffering have been both diminished wherever the English acts have been enforced, the physicians

of the United States still hesitate to range themselves on the side of right and progress; and the reason is that they are afraid of the clergy, the ladies, and the professional philanthropists.

LIFE INSURANCE COMPANIES AND PHYSICIANS.

The case of Colonel Dwight, of Binghamton, the gentleman who was so unkind to the life insurance companies as to die shortly after he had placed a number of heavy policies on his life, has been made familiar to the whole country. Of course, the insurance companies were highly indignant at this action of the Colonel's; they had entertained no idea of paying the policies, but on the contrary, of receiving premiums on them for many years. Hence, they called a caucus of doctors, headed by the eminent pathologist, Dr. DELAFIELD, to examine the cadaver; but, to their disgust, this caucus unanimously rendered a verdict of death from natural causes. The body was then buried, but the insurance companies were not satisfied, and after some six months, dug it up again, and had a second caucus of pathologists upon it. Again the experts returned an opinion of death from natural causes. But the agile intellects of the insurance companies were not to be foiled. As after two post-mortems and six months' interment the Colonel did not look like himself, the companies had the happy thought that there had been personation, and that in fact the Colonel is yet living, and had hired somebody who resembled him kindly to die in his stead, and on this ground they continue, with one exception, to refuse payment on the policies!

Such is a history of the way most life insurance companies treat their patrons when they get a chance. We mention it more especially because they are constantly endeavoring to obtain the assistance of physicians to enable them to escape their just obligations. As soon as a policy holder is dead, some companies send a printed series of leading questions to his physician, or an agent calls in person and propounds them. The doctor is asked whether his late patient died certainly from natural causes; whether bad habits of some kind did not hasten death; whether the disease may not in origin have antedated the policy; whether some other disease may not have predisposed the patient, at the date of the policy, to this one of which he died, and a multitude of other catch questions of the kind.

Such a case we notice was lately reported by Dr. Layton to the New Orleans Medical and Surgical Association. It is as follows:—

"A gentleman who had met with reverses in fortune took to drink. Nine months ago he had an attack of delirium tremens. Was called to see him on Monday last, and obtained the following history:—

"On Sunday he had taken a walk after dinner, drank somewhat freely and suddenly fell unconscious, in which condition he remained the greater part of the night. He must have had convulsions at the time. Early Monday morning he had violent convulsions. The Doctor appreciating his precarious condition requested a consultation, and Dr. BICKHAM was called in. On examination his urine was found albuminous; he never recovered consciousness, and died at 7½ P.M. His son called upon the Doctor and stated that the life insurance company in which he was insured was disposed to cause trouble in regard to payment of the policy. The agent afterward called to know what diagnosis had been given in the death certificate. The Doctor said it was albuminuria. The agent then wanted to know if the Doctor had any previous knowledge of the patient's having had albuminuria. The Doctor said 'no.' Agent wanted to know what were his habits. The Doctor refused to give him any information, on the ground that what knowledge he had acquired was a professional secret."

Dr. LAYTON went on to say that a great many insurance companies were disposed to contest payments on small grounds, and wished to know if a physician can be called upon to tell what he may have learned professionally in regard to a patient.

We are very strongly of the opinion that a physician should absolutely refuse to disclose this or any other fact which may prejudice a patient's case, when he has learned it through his professional relations. In nine cases out of ten such information is intentionally misconstrued and misused by the agents to defraud widows and orphans, and we do not believe that the Supreme Court of any State would rule that the physician is legally bound to divulge his knowledge.

It is only too evident that the majority of insurance companies will not scruple to resort to

any means to escape the payment of their policies, and it behooves physicians to be exceedingly careful to avoid aiding them in such nefarious designs.

Notes and Comments.

Ulcerations of the Cervix Uteri.

Drs. Veit and Ruge, of Berlin, have been studying microscopically the various affections of the os and cervix. From their examinations they have arrived at the conclusion (1) that the views generally held of the nature of erosions and follicular ulcerations of the cervix require great modification, these changes being really due to glandular outgrowths (*drüsige Wucherungen*), a drawing of which accompanies the paper. That (2) where the clinical diagnosis fails in certain cases of fissured cervix with epithelial outgrowths in the cervical canal, the microscope can decide with certainty for or against cancer. Ruge also states "that pieces scraped from the interior of the uterus have proved the existence of cancer several times, when there was still absolutely no certain clinical suspicion of it," and that Freund's total extirpation of the uterus was consequently performed, to the extreme benefit of the women. Lastly (3), they consider excision and "erasion" imperatively indicated "in doubtful cases, where the clinical examination alone does not give information enough, and where it is a question not only of prognosis, but of the early performance of important operations which it may be impossible to execute later on, when the physical signs are no longer doubtful." Their papers appear in the Berliner *Klin. Wochenschrift*, Jan., 1879.

Poisonous Dyes.

In this country too little attention is given to preventing the domestic employment of poisonous dyes. An English writer in the *Medical Press and Circular* calls attention to the fact that many of the aniline dyes may contain arsenic in quantities that are very injurious to the health, although the symptoms come on so insidiously, and are sometimes so anomalous, that their real cause may escape detection. Inflammation or irritation, and smarting of the eyes and nostrils, a feeling of debility and general *malaise*, headache, catarrh, dry cough, griping in the bowels and tendency to diarrhœa, are among the chief symptoms that have been observed in those who have suffered from this form of arsenical poisoning. It may be that the evil complained of is not so great as it has been represented. Nevertheless, after making due allowance for a little exaggeration, the propriety of putting a stop to the wholesale impregnation of wall papers and other materials with arsenic, cannot be questioned.

The Forms of Alcoholism.

The *British Medical Journal* states that Dr. Rabuteau, of Paris, says that wines alcoholized with the alcohols of the North, which are produced from amylaceous substances, produce true alcoholism, and not the natural wines, or those alcoholized with pure spirits of wine. There are three varieties of alcoholism: 1. Ethylism, produced by natural wines or ethylic alcohol; it causes a gay sort of intoxication, without any serious consequences. 2. Amylism, or true alcoholism, produced by wines alcoholized with amylaceous, butylic and other spirits; it renders the subject stupid, dull, and heavy, and such wines are supremely prejudicial to the health. 3. Anæsthesism, produced by the ethers of wines, and particularly the acetic ether of white wines, which affect the head, produce trembling, and, perhaps, affect the stomach, but they are not so dangerous as the amylaceous spirits.

Poisoning by Glanders.

Glanders is a disease which the laws of every State should require to be stamped out by the instant destruction of the animal which has it. Quite a number of fatal cases in the human subject have been reported this year, both in England and America. It will not add to the comfort of the thousands of men who make daily use of trotting wagons and buggies to know that cases are related in which passengers in such vehicles have been infected with glanders by matter thrown off from the horses behind which they were seated.

What Constitutes Hermaphroditism.

That extremely rare malformation which constitutes the hermaphrodite has been variously interpreted by authors, some holding that the coexistence of the external organs of both sexes is a sufficient indication of its existence. The subject was discussed by Dr. Watson, at a recent meeting of the Manchester Medical Society.

After sketching in outline the chief facts concerning the development of the sexual apparatus in the mammalia, he proceeded to point out the homologies of the genito-urinary organs in the two sexes. Dr. Watson concluded his paper by

affirming that since it was evident that in the female the parts may be arranged exactly as in the male and *vice versa*, the specific mark of sex is the presence of a distinctive sexual gland; and that, consequently, the only form of true hermaphroditism is that in which a testicle and an ovary coexist in the same individual, while all other forms must be regarded as spurious.

The Vomiting of Pregnancy.

In the *Transactions* of the Vermont State Medical Society, Dr. George Davenport insists, in a timely and forcible manner, on the propriety of inducing premature delivery when the vomiting of pregnancy resists milder measures. He says: "After using faithfully and intelligently the appropriate remedies, and the patient is still failing, the symptoms no better, then, after consultation, if you choose to, resort to the induction of premature labor, with great hopes of success. There is still one more consideration to be taken into account, and it is this: not to fail of emptying the uterus by artificial means under these circumstances, no matter what the opposition may be. The duty of the practitioner is plain—to save the life of the mother, regardless of the embryotic or fœtal life, and to those who oppose it effectually, to them and with them the responsibility must remain."

This is sound doctrine, and is too often overlooked, through timidity.

The Fluids of The Body.

Professor Jäger, of Leipsic, has recently published a work in which he maintains that an increased proportion of water in the tissues and humors of the body is one of the most essential conditions of liability to disease. To guard against disease, therefore, it is necessary to make the body yield as much water as possible through skin and lungs, and to avoid all that favors the accumulation of water. To this end he recommends the wearing of close-fitting woolen clothing throughout the year; all bodily movements which promote perspiration; on outbreak of disease the use of vapor or sweating baths, of drinks that excite perspiration, and of foods that do the same; constant ventilation of sitting and bed rooms, so that the moisture of the air may not become great. Dr. Jäger asserts that the specific gravity of a living body is an accurate criterion for the strength of constitution of a man or a domestic animal—that is to say, for its capability of resistance to causes of disease, such as chills, infection, etc., and its power of work, bodily and mental.

Treatment for Deficient Secretion of Milk.

A correspondent writes to the *British Medical Journal*—

My custom, after a confinement where there is a deficiency of milk, is to allow the patient an egg three times a day, beaten up in equal quantities of new milk and barley water to make a pint, and let her have a pint of lentil soup on going to bed at night, or if this is not to be had, a pint of gruel made very thick, and afterward thinned down with milk. I give imperative instructions for the infant to be suckled at regular hours only, and the breasts to be emptied at each application of the child to them.

This treatment, with twenty drops of dilute phosphoric acid, two grains of quinine, and ten drops of spirits of chloroform in two ounces of water, twice a day, has been very effectual in my hands.

Palmetto Berries and their Uses.

The medical properties of the berries of the saw palmetto are spoken of by Dr. J. B. Read, of Savannah, in the *American Journal of Pharmacy*. He says the berry, in all cases where a highly nutritive agent is needed, seems to apply well and to fulfill the indications. By its peculiar soothing power on the mucous membrane, it induces sleep, relieves the most troublesome coughs, promotes expectoration, improves digestion, and increases fat, flesh and strength. Its sedative and diuretic properties are remarkable. It has been used with benefit in cardiac asthma, phthisis (especially laryngeal phthisis), chronic bronchitis and dilation of the bronchial tubes. Its action in catarrhal affections is rapid and permanent. A cold in the head may be abated by two or three doses. Mixed in boiling water, and used by inhalation, it has been found very beneficial in chronic ozæna.

Cure of the Opium Habit.

Dr. Osgood, of the Missionary Hospital at Foochow, has treated successfully several hundred cases of the opium habit by the following plan: 1. The total and absolute discontinuance of the opium from the beginning of treatment. 2. A trusty attendant to be with the patient day and night for the first three days. 3. Chloral hydrate for the first three nights, if required. 4. Good food, milk, raw eggs, brandy (in some cases), and chicken broth. (The above is taken in small quantities and frequently.) 5. In diarrhœa, give two-drachm doses of a mixture of equal parts of tincture of catechu and tincture of ginger.

Correspondence.

Irritable Ulcer of the Rectum Treated and Cured by Forcible Dilatation.

Ed. Med. and Surg. Reporter:—

Several months ago a middle-aged gentleman, of the nervo-sanguine temperament, called upon me for medical treatment for, as he termed it, chronic diarrhœa.

The subject before me, as he then appeared, can best be described to the medical man who has treated "irritable ulcer of the rectum." The patient was very much emaciated in flesh, mind considerably depressed, and a general bad habit of body, presenting much the appearance of cancerous cachexia.

I found, from the history of the case, that he had suffered eight years from this formidable disease, almost constantly (he had been under treatment five years ago, which proved only temporary in his case; the measures used were medicinal, no surgical procedure instituted). I further learned that his evacuations never attained to the round cast of the bowel, but a thin, watery discharge, generally of a clay color; this, with a frequent desire to defecation, was, as he said, almost intolerable; there was no very lancinating pain, but a growing and uneasy sensation always attending this act.

I concluded it was a case of *entero-colitis*, and after preparing the system with a light mercurial purgation, combined with quinia sulphate, I then made a prescription—

℞. Zinci. oxid.,
Sodæ bicarb., āā grs.x
Fiant chart. No. i.

Sig.—One, and repeat three times a day, after meals.

I expected to derive much benefit from this prescription, as I had formerly treated several cases of children with similar affections very satisfactorily. I will here add, notwithstanding the failure to control the flux entirely, it proved a good and useful prescription, and by pushing the remedy, could almost secure consistent evacuations, but owing to a vermicular motion produced thereby, attended with much pain, I was forced, therefore, to discontinue it.

I then concluded to try the sol. ferri pernit., eight-drop doses, three times daily.

This, continued for several weeks, seemed to do good at first, but was slow in action, and I abandoned it. At this time, Drs. F. and H. saw the case with me. After making an exploration of the rectum, the treatment adopted, *systemic*, was—

℞. Hyd. chlor. mit., grs.xxv
Pulv. doveri, grs.xx
Fiant chart. No. x.

Sig.—One, and repeat every two hours.

And now alternating with mineral acids—

℞. Acid. mur. dil.

Sig.—Twelve drops, four times a day.

Locally, the injections with Mattison's syringe consisted of sol. lead and ergot—

℞. Fl. ext. ergot, ℥ ij
Plumbi acet., grs.xxx
Aquæ font., ℥ ij.

Sig.—To be thrown into the rectum thrice daily.

This treatment for a while did apparent good, although I attribute the improvement to the mercury and acids, and not the injections.

Now, it occurred to us that the disease had not been reached, therefore, aided by a stomach pump tube I introduced and passed above the curvature of the descending colon a solution of nitrate of silver, twelve grains to a pint of water. This operation was repeated from time to time with increased strength of the silver, but only with slight mitigation in the symptoms of the case. Lastly and finally, we concluded to try forcible dilatation. The patient was at once chloroformed by my assistants and laid across the bed. I proceeded to operate "by fixing and introducing both thumbs well beyond the external sphincter, back to back, then taking a purchase from the buttocks with the outspread fingers, carried the thumbs forcibly apart until their palmar surfaces were arrested by the ischial tuberosities." After this the treatment consisted mainly of tonics, and the patient began to improve immediately. This operation seemed to have almost a magical effect. Just think for a moment, a patient that has been bedridden for months, prostrated by frequent discharges, almost restored in a few weeks and now is a well, hearty and stout man.

I report this case for two reasons: first, to show that a disease so intractable will yield readily to a practical manipulation; secondly, that one simple in pathology, although of not frequent occurrence, is so liable to be overlooked by the general practitioner. In conclusion, let me recommend to your readers a little work on the diseases of the rectum, by Dr. W. H. Van Buren: it is small, yet replete with good and useful information.

E. W. Rush, M.D.

Paris, Texas.

A Case of Hereditary Malarial Poisoning.

Ed. Med. and Surg. Reporter:—

I was summoned to see Mrs. L. during the fall of 1878. She was suffering from an attack of intermittent fever of tertian type, and had had several paroxysms previous to the one at date of visit. She had another paroxysm the second day after date of first visit, during which she gave birth to a female child, at eight and a half months. The child did not do well, and soon presented unquestionable symptoms of a malarial cachexia, which yielded promptly to a treatment by antiperiodics. The child is at present in good health.

That malarial diseases are constitutional, there is, of course, no doubt; why malarial disease should or could not be hereditary, especially from the mother when suffering from the disease during pregnancy, particularly so near full term of gestation is not clear; that malarial poison is

communicated from father to offspring is less probable. Still, this may be possible; the semen may be contaminated; but, if the mother's system is free from any malarial taint, it is highly improbable that the child would suffer from such disease; on the contrary, however, if the mother's system should not be free from the poison throughout her term of gestation, it is fair to presume that the little flame contracted from the father would feed on the fuel furnished by the mother. It is more than probable, that in the event of the mother's system being free from malaria, though the semen of the father be contaminated, that the pure blood of the mother would so affect or neutralize the poisoned semen during gestation, that no trace of malarial cachexia would be visible in the child at birth.

H. L. Getz, M.D.

Marshalltown, Iowa.

Inverted Toe Nail.

Ed. Med. and Surg. Reporter:—

One of the most troublesome affections with which the practitioner has to deal is inversion of the nail of the great toe. Most surgeons regard all treatment save excision as of no avail, and to this the patient will not usually submit until other means have been ineffectually tried. Thus it becomes a matter of annoyance to attendant and patient alike.

The treatment which I here give in detail is one which, in my hands, has been attended with unvarying success. It is by no means radically new, save in one or two points originally suggested to me by Dr. Chandler, of the northern part of this city.

The first thing to be done is, with a piece of glass, to scrape the top of the nail, along its middle, as thin as can possibly be borne. Then, with a sharp knife, cut from the middle of the free edge a v-shaped piece, carrying the apex of the v back as far as possible. The inverted corner is not to be disturbed, but is to be allowed to grow out squarely. For I have long regarded the cutting away of the corner of the nail as the most frequent exciting cause of the very difficulty in question. I say exciting cause, for I firmly believe, as Prof. Gross intimates, that the main predisposing cause is heredity. I personally know a family in which a mother and three children have been thus afflicted. And in another family, closely related to the former, the mother and two children have been victims to the same annoyance. In these cases the children suffered in this way very early in life, thus lending considerable weight to the influence of heredity.

To return to the line of treatment, however, under the corner of the nail, which was to be allowed to grow out squarely, there must be placed a pledget of lint, of as large size as possible. This piece of lint must be thoroughly saturated with a mixture consisting of three grains of carbolic acid to one ounce of glycerine. Pains must be taken to have the lint wedged as tightly under the nail as possible. The lint must be renewed at least once daily. By these means I have been able to cure every case which has come under my charge. Some of these cases had, for years, I was told, presented an ulcerating surface, covered with unhealthy granulation, and emitting an intensely fetid discharge.

J. W. Hickman, M.D.

1945 *N. 11th St., Phila., May* 26, 1879.

News and Miscellany.

The Plague.

Professor Hirsch has reported to the German Sanitary Office that his investigations on the spot leave no doubt that the epidemic at Wetlyanka was really one of true plague. He also states that besides being the actual focus of the disease, Wetlyanka is the only place where it acquired an epidemic character. Isolated cases in surrounding districts were always traceable to infection from Wetlyanka. An accurate scientific account of the epidemic is impossible, as all the physicians who were on duty during it are dead, without leaving behind them any notes of their observations. It appears, however, that the mortality was about 80 per cent. at Wetlyanka itself, and equal to 100 per cent. in the outlying districts. There is a suspicion that the origin of the disease had some connection with the war in Asia. The English medical men who were sent to Russia to inquire into the recent outbreak of plague have been able to associate its appearance in Europe in so many instances with the passage or cantonment of soldiers brought over from Asia, as to leave but little doubt as to the method by which infection has been spread. A specific form of plague known to foreign physicians has existed from time immemorial among certain tribes of Central Asia, and although not always so fatal in its effects among the natives of the regions where it is endemic, it is most deadly when it attacks immigrants from other countries.

The Cholera.

Cholera has been making fearful havoc among the pilgrims returning from the Hurdwar fair, and is being spread by them through northern India. It is asserted that between 20,000 and 30,000 hillmen from the Himalayan districts near Nynee Tal died on their homeward journey. Several cases, most of them fatal, appeared among the 15th Hussars almost immediately after their arrival at Meerut from Candahar, and it is supposed that the outbreak is due to some men having traveled from Mooltan in railway carriages which had been used by infected pilgrims. The disease has appeared in most cities of the Punjaub, and the fear of the spread of the epidemic to Peshawur has induced the authorities to remove the greater portion of the garrison there.

—Dr. Schliemann and Professor Virchow have been having what school girls call "a perfectly lovely time" together. They have been digging away at Troy, and have come across great masses of charred buildings, and also a splendid treasure of ancient jewelry.

State Medical Society of Pennsylvania.

Dr. Charles S. Turnbull, of Philadelphia, exhibited a case of living Filaria in the eye of a horse, on the afternoon of Wednesday, which was overlooked in our report of the proceedings.

American Neurological Association.

The American Neurological Association will hold its fifth annual meeting in New York city on Wednesday, June 18th, and will continue three days.

Personal.

—A dispatch from Paris announces the death of Dr. Pierre Adolphe Piorry. He was born at Poitiers, December 31, 1794. While pursuing his medical studies he was conscripted, but was relieved from serving in the ranks, and was made a surgeon, and attached to the army in Spain. He returned to Paris on the fall of the first Empire, received his degree in the year 1816, and was attached to the school of Broussairs.

Items.

—A "hygienic institute" on a grand scale was opened in Munich on the 10th of April.

—Ten young ladies graduated May 22d at the Women's Medical College of New York.

—Prof. H. Cohen has proved by a number of experiments that letters, lines and all colors can be recognized at a greater distance by the aid of electric light than by either gaslight or sunlight. Hence this light is most suitable for signals, etc. Yellow is distinguished sixty times better, red six times, green and blue twice as well as in daylight.

OBITUARY NOTICES.

Dr. Francis Fontaine Maury

Died at his late residence in this city, June 4th, of pulmonary disease, in the thirty-ninth year of his age.

The deceased was born in Danville, Ky., August 4th, 1840, and was educated at Centre College, in that city. His first course of lectures was attended at the medical department of the University of Virginia, and afterward he attended a course at the Jefferson Medical College of Philadelphia, where he graduated in 1862. He was considered one of the most skillful surgeons in Philadelphia. Among the remarkable operations performed by him was a successful amputation at the hip-joint; he performed the first operation for gastronomy in this country. He edited the *Photographic Bureau of Medicine and Surgery* for two years, and published a number of reports of medical and surgical cases. He was surgeon to the Jefferson Medical College Hospital, surgeon to the Philadelphia Hospital, and during the war was Surgeon-in-Chief of the United States Army Hospital, at Twenty-fourth and South Streets, in this city. He was a lecturer at the Jefferson College, and was a member of the College of Physicians and Pathological Society of Philadelphia.

QUERIES AND REPLIES.

E. S. of Florida, writes:—Having read Dr. Herrick's two articles on the Treatment of Stricture and Gleet with Galvanism, I would like to enquire of him if he has ever adapted his new method to the treatment of prostatorrhœa or spermatorrhœa, and with what results.

Carduns.—There are two Hay Fever Associations, one the "United States," the other the "Northwestern."

R. W., of Va.—The common name "hives" is applied generally to urticaria; also at times to herpes.

Morus.—The so-called "thériaque," is a composite preparation still officinal in the French Codex. Jeannel, in the last edition of his "*Formulaire International*," classes it among the "vegetable reconstituents," and gives a formula for it containing fifty-seven ingredients, among which are castor, opium, earth and dried vipers.

Senex.—"Kidney-wort" is the vulgar name for *Umbilicus pendulina, sen Cotyledon umbilicus.* It is alleged to be diuretic and tonic, but has no certain value. The secret medicine sold under that name we know nothing about, and presume that like most such it is worthless.

MARRIAGES.

FRISBY—NICHOLS.—On the 27th ult., by the Rev. H. S. Phillips, rector of P. E. Church of the Crucifixion, Dr. S. Clarke Frisby, of Philadelphia, and Miss Mary E. Nichols, of Baltimore, Md. No cards.

HENGST—REED.—On Wednesday, May 14th, at the Second U. P. Church, Allegheny, Pa., by Rev. W. H. McMillen, Dr. D. A. Hengst, of Pittsburg, and Miss Carrie E., daughter of Dr. J. A. Reed, of Dixmont, Pa.

HIXSON—THOMPSON.—In New York, at the Church of the Holy Trinity, by the Rev. Dr. Tyng, Sr., C. C. Hixson, M.D., of Hillsboro, and Miss M. L. Thompson, of Cincinnati.

KRUPP—STAINSBY.—In Philadelphia, on the 15th ult., by Rev. H. S. Hoffman, Franklin Krupp, M.D., and Miss Ada Stainsby.

MATHIAS—CHRISTENSEN.—On Thursday, May 15th, 1879, at Brooklyn, N.Y., by the Rev. S. B. Halliday, at the residence of the bride's parents, Dr. Andrew M. Mathias, of Hilltown, Penn., and Ophelia, eldest daughter of Gen. C. T. Christensen. No cards.

NEELY—THOMPSON.—In Philadelphia, May 8th, by Rev. J. C. Thompson, John M. Neely and Alice A. Thompson, daughter of N. G. Thompson, M.D., all of Brandywine Manor, Pa.

PIERSOL—STEEL.—In Philadelphia, on the 1st ult., at the residence of the bride's parents, by the Rev. E. A. Hoffman, D.D., George A. Piersol, M.D., and Miss Annie W. Steel.

THOMPSON—PEACOCK.—On May 21st, 1879, by Rev. T. B. Neely, Dr. W. M. Thompson and Miss Laura Peacock, both of Philadelphia.

WAMPOLE—SCOTT.—On Wednesday evening, May 21st, 1879, "At their Home," in North Wales, Penna., by the Rev. Francis A. Gilbert, of the M. E. Church, Dr. William H. Wampole and Miss Lydia N. Scott, of Salem, N. J.

WARDLE—WALLINGFORD.—On the 7th ult., at the residence of the bride's parents, by the Rev. Mr. Alderson, Dr. Charles Wardle, of Cincinnati, and Miss Belle Wallingford, of Maysville, Ky.

DEATHS.

MEARS.—In Brooklyn, on May 28th, after a brief illness, Mary L. Mears, wife of Dr. John Mears, and eldest daughter of Horace F. and Ann M. Burroughs, in the 24th year of her age.

SKELTON.—In Philadelphia, on the 20th ult., Charles Skelton, M.D., aged 73 years.

R. & J. BECK,

MANUFACTURING OPTICIANS,

1016 CHESTNUT STREET,

PHILADELPHIA,

Beg to call the attention of physicians and students to the following novelties recently introduced by them:—

Beck's New National Microscope, Monocular,	$ 75.00
Beck's New National Microscope, Binocular,	100.00
Beck's Economic Microscope, Monocular,	35.00
Beck's Improved Economic Microscope, Monocular,	50.00
Beck's Improved Economic Microscope, Binocular,	80.00
Beck's New Histological and Dissecting Microscope,	25.00
Beck's New Model Dissecting Microscope,	15.00
Beck's New Volute Turn Table, self-centering for all slides,	7.00
Mr. Walmsley's New Freezing Microtome, complete, with Atomizer,	20.00
Beck's New Clinical Thermometers, with indestructible index and ineffaceable scale.	
Dr. Seiler's Section Knife and Carrier,	12.00
Dr. Woodward's Diatom Prism, mounted,	1.50

The above instruments, together with every article used by the microscopist, will be found fully illustrated and described in our catalogue of 144 pages; mailed free to any address.

HINTS IN THE OBSTETRIC PROCEDURE.

BY

WILLIAM B. ATKINSON, A.M., M.D.,

Lecturer on Diseases of Children, at the Jefferson Medical College; Physician to the Department of Obstetrics and Diseases of Women, Howard Hospital, Philad'a.

SECOND EDITION. ENTIRELY RE-WRITTEN AND ENLARGED. 12MO, CLOTH. PRICE, $1.00.

—o—

The very gratifying reception given this handbook of the essentials of the obstetrical art has led the author to submit it to a careful revision, and increase its size by adding a number of new topics.

It may safely be characterized as the most convenient, compact, reliable and handy *vade mecum* on obstetrics in the language; as the following personal and editorial statements sufficiently attest.

OPINIONS OF PHYSICIANS AND THE PRESS.

"It is really a '*multum in parvo*,' and will, I am sure, be of great service to multitudes in the profession who have hitherto followed the routine of old traditions."—*Prof. Fordyce Barker.*

"It is as good for the old as for the young practitioner."—*Dr. J. Marion Sims.*

"It abounds in extremely valuable hints, and is calculated to do much good."—*Prof. Goodell.*

"Founded upon the personal experience of the author, it must prove of value to the very wide circle of the profession who will be led to purchase it by their acquaintance with the author and his reputation."—(Philadelphia) *Medical Times.*

AN ABSTRACT OF A PAPER ON THE EXTERNAL TREATMENT OF SKIN DISEASES.

Read before the Pennsylvania Medical Society,

BY JOHN V. SHOEMAKER, A.M., M.D.,

Of Philadelphia.

After setting forth the object of the external treatment in skin diseases, the speaker added that either a cure or a temporary relief could be accomplished by either hygienic, medicinal or mechanical remedies, or a proper combination of them. The hygienic measures considered were the condition of the air, the necessity of ablution and bathing, the suitable kind of clothing, and the proper exercise and rest. These topics were discussed at some length, and were followed by the means of reaching disease by local medication. Under this class of medicinal agents were included soaps, poultices, lotions, ointments, dusting powders, oils, caustics and the oleates. All these medicinal agents were carefully considered in their turn, and very many points as to their therapeutic application in cutaneous diseases were derived from the observation and experience of the lecturer. The oleates, preparations that were recently introduced into practice, were said to possess in certain diseases many advantages over ointments. In illustration of this it was claimed that oleic acid possessed solvent powers that were more active than most bases of ointments, and consequently, the chemical combination so formed would be more potent when applied to the skin. Further, that the oleates would not decompose like ointments, and would on this account be more effective, and not act as irritants to the skin. That the oleates prepared either as a five or ten per cent. solution are all, with the exception of the oleate of zinc, in the liquid state, and would, therefore, have a greater absorbent power. They would also penetrate deeper and more rapidly into the tissues than ointments. And lastly, as they are of a liquid condition, with one exception, they would be better suited for application over the scalp, the beard, axillary and pubic regions, or any hairy parts of the body, in preference to ointments, which frequently mat together the hairs.

The Doctor, in concluding this valuable and practical subject, adds: "I have frequently had occasion to apply the oleates as external remedies in the treatment of skin affections, with the most happy results. I may first mention that the oleate of atropia (one grain of the atropia to the ounce of oleic acid) exerts a marked influence in arresting the abundant secretion of seborrhœa, and in subduing high inflammatory action in severe cases of erysipelas. Secondly, I have observed that a 40 per cent. solution of the oleate of mercury, with the addition of a small quantity of olive oil, and scented with some essential oil, is an invaluable application for general thinning and loss of hair. When brushed lightly over the scalp in the above condition, it produces both a tonic and alterative effect upon the part. I have also employed as an application, with great success, a two-ounce solution of the oleate of mercury, of 10 per cent. strength, mixed with an equal quantity of olive oil, in psoriasis and pityriasis, after all the scales and redness have disappeared. The use of this preparation in

these affections protects and soothes the hyperæmic skin, and prevents a return of the diseased condition.

Mr. L. Wolf, pharmaceutist and chemist, of Philadelphia, has lately made for me, after many tedious experiments, two additional preparations of the oleates, namely, the oleate of lead and the oleate of bismuth, and I believe I have been the first to use these remedies as topical applications in cutaneous affections. The former of these agents, the oleate of lead, is manufactured by adding liquor potassæ to a diluted preparation of liquor plumbi subacetatis, and the precipitate collected on a filter and dried. The dry oxide of lead should then be dissolved in oleic acid, by means of the water bath. The strength of the solution should be 5 per cent. of lead oxide to the oleic acid, and as free as possible from steric and margaric acids, in order to have it in the liquid form. Should either the per cent. of lead be increased or the solution contaminated by steric or margaric acid, the oleate will be semi-solid, and will not have the same efficient action.

The oleate of lead, if prepared with care, in the manner I have indicated, is an opaque, oily liquid. It is a mild astringent, more readily absorbed than either Goulard's cerate or Hebra's litharge ointment, while it possesses the advantage of neither decomposing nor turning rancid. I have obtained remarkably good results from its use in eczema, in rosacea, after depletion of the parts, in burns and in erythema. It arrests morbid discharges, protects the surface, and by its astringent and sedative action allays irritation.

The oleate of bismuth, an oily, brown liquid, the second one of these new preparations of the oleates, is not so difficult to manufacture as the last named, and I will, therefore omit the manner of making it. It, however, possesses valuable medicinal effect when applied in pustular eruptions, especially in sycosis and hepatic affections. It is also a most useful remedy in soothing and relieving cutaneous irritation when mixed with an equal quantity of olive oil, and applied in acute specific eruptions, especially in scarlet fever.

The paper also included under this head an account of the oleates of iron and antimony, a full description of all the other medicinal substances that were previously enumerated, and finally, a concise and valuable allusion to friction, compression and blood letting, the mechanical remedies for alleviating and curing cutaneous affections.

REPORT OF A FATAL CASE OF OVARIOTOMY.

BY J. J. STEINRIEDE, M.D.,
Of Yazoo City, Miss.

On February 21st, 1879, I was called upon to see a Mrs. R., fifty-one years of age, mother of six children, the last one twenty-five years old. Her last labor was premature and difficult; was, however, delivered, without instruments, of a seven months' child, which lived three months. Her general health has always been good, except for the last four years, when she commenced to be irregular in her menstrual periods, which were profuse and of longer duration, but regular as to their occurrence up to the very date I saw her. She is of a sanguineous nervous temperament, short stature and inclined to be stout; has always been a hard working woman. In April, 1878, she noticed a small "lump" make its appearance in the left lumbar region, which was painful, so much so that she consulted a physician, who pronounced it an affection of the kidneys, and prescribed buchu and various other diuretic medicines. In July, 1878, she noticed two small tumors on each side of her bowels in the iliac region, over the sigmoid flexure, which gradually increased in size, in spite of various remedies used. Seeing that she was not benefited, she dismissed her physician and placed herself under the treatment of a noted midwife up to the time I was called in.

The midwife was present when I saw her, and had diagnosed the case as a tumor in the womb. The midwife told me that she did not know what to do in the case, as she had done all she could, and the tumor still increasing in size, she had sent for me to make an examination of the case. On looking at the patient lying before me in bed, I could not see how the poor woman could increase in size much more. Her extreme anæmia, contracted features and crouched position of the body, were evidently signs of long and hard suffering. Placing her on her back, a position she could not maintain long, I found the abdomen enormously and universally distended, glossy in appearance; no hard tumor, or a circumscribed tumor of any kind or size could be detected; no œdema of the lower extremities, nor had they been œdematous. On percussion I could not detect any fluctuation; there was elicited a dull, heavy, thud-like sound. On a specular examination, per vaginam, I found the os uteri slightly prolapsed, the neck of the womb normal and movable, but somewhat engorged. I was convinced that the uterus was not this time the mischief maker, and that I must look for

other causes. Summing up all my evidences in the premises, I concluded it to be ovarian dropsy, although the origin of the first tumor in the left lumbar region dampened my judgment a little. She was sadly in need of a tonic, so I prescribed quinine with tincture of iron, iodide of potassæ and compound jalap powder, as she was suffering with constipation of the bowels.

On the 10th of March I saw her again, she living five miles in the country, and found her general health improved. The swelling in the right and left iliac region had somewhat diminished, but otherwise the same. Pulse about 96; temperature normal; respiration impaired. Was compelled to take Dover's powder at night, to obtain rest. Heard from her on the 16th; reported better. On the 19th I requested my friend Dr. P. J. McCormick to ride out with me, who kindly consented. The Dr. thought, on examination, that there might be some ascitic fluid in connection with the other trouble, and advised paracentesis abdominis. On the 21st paracentesis was performed, and I was not much surprised that, instead of water, I found a thick, gelatinous substance, of an amber color, slowly escaping through the canula, so that in about 30 minutes I did not obtain more than a quart. This small amount gave her some relief, and she was more than ever desirous to have the matter taken away from her. I reported to Dr. P. J. McCormick my success, and we came to the conclusion that if the tumor was monolocular, with a larger trocar we might possibly be able to evacuate the cyst. So on the 27th, armed with the largest trocar we could obtain, Dr. McCormick performed paracentesis, and this time we did not obtain more than a couple of ounces of the same fluid in about fifteen minutes. It was evident now that we had to deal with a multilocular tumor, and that nothing save an operation would benefit her. After a brief consultation, we concluded to lay the case before her. We told her that there was no possibility of evacuating the contents of the tumor, except by an operation; that in performing the operation she would only have a possible chance of recovery, that she even might die under the operation; remaining in her present condition, however, would be certain death, and that not very distant. If she would avail herself of the possible chance of recovery, we would perform the operation. She very readily consented to have the operation performed, as her sufferings were great, and remarked that if the operation should prove fatal, even during its performance, it would shorten her life but a very few days, and relieve her of a vast amount of suffering.

On the 2d of April Drs. P. J. McCormick, R. Dunn and myself met at the residence of the patient, to perform the operation, rather reluctantly, as the case, on account of her extreme debility, was by no means a promising one. The condition of the patient at this time was, pulse 120, temperature normal, tongue slightly furred, very little nervous excitement. The bowels had been moved and well purged the night before, and the bladder evacuated immediately on our arrival. Abdomen hard and tense, breathing hurried and rather difficult. We administered ether at first, and then chloroform and ether, equal parts. Patient came under the influence of the anæsthetic very rapidly and quietly. Dr. McCormick, as the senior member, at my request, consented to perform the operation. He made an incision from about one inch below the umbilicus, through the linea alba to the symphysis pubis, and dissected very carefully to the peritoneum. On opening the peritoneal coat, the tumor suddenly bursted, as the abdominal walls relaxed and gave way. At least six gallons of a thick gelatinous matter, of a very offensive odor, escaped. We could distinctly see that cyst after cyst emptied itself, by the change and pause in the matter as it escaped. The matter was mostly of an amber color, some dark brown, like mahogany, and some of a whitish color, closely resembling the white of an egg, and equally tenacious. After having evacuated the matter, I then introduced my hand into the abdominal cavity, previously anointed with carbolated oil, to find the pedicle. The left ovisac was easily found; it was attached to the posterior part of the fundus uteri, by a broad continuous band. This almost fan-shaped band coalesced with the posterior wall of the abdomen, involving the spleen and the kidneys, the small intestines having been pushed up. The right ovary was not attached to the uterus, as the left, and was easily distinguished from the surrounding tissue, but on tracing it up we found its attachment coalescing with that of the left ovary, and the whole formed a kind of network, with a firm attachment of the entire space of the posterior part of the abdominal cavity. In this dilemma we came to the conclusion that to undertake its entire detachment would not only be dangerous, but fatal to the patient, as she naturally would lose a good deal of blood, of which she had none to spare. Having still my hand in the abdominal cavity, I broke up all the cysts I could find, and drew the empty cysts as far as possible out of

abdomen, where we cut them off, so as to destroy continuity. This was done without any loss of blood. We washed the abdominal cavity thoroughly, with carbolic acid water, one to sixty, inserted a drainage tube, and closed the wound by sutures. During the whole operation, which lasted about three-quarters of an hour, our patient did not lose more than two ounces of blood.

I will here remark that we gave the patient, before the operation, six grains of quinine and a teaspoonful of the following recipe :—

℞. Battley's sedative, ℥ ij
Sodæ bicarb, ℥ j
Aq. menth. pip. q. s. ad fiat mistura, ℥ iv.

We gave the following instruction to the midwife still in attendance : To keep the temperature of the room at 80° Fahr., to give the patient a teaspoonful of the above sedative mixture every two or three hours, to put bottles of hot water around her and to her feet, if she feel in the least cold and chilly, and to keep her perfectly quiet ; for nourishment, brandy, beef tea, milk and lime water. Patient reacted well from the anæsthesia, and we left her comfortable ; Pulse 104, temperature 97½° ; respiration easy and free ; expresses herself greatly relieved.

April 3d. Countenance cheerful; pulse 108 ; temperature 102 ; respiration 20 ; slept well all night ; vomited twice since we left ; no pain ; the drainage tube discharging matter, about one quart ; urine normal, which was ordered to be drawn every six hours. I injected through the drainage tube about one quart of carbolic acid water, 1 to 60, at 100° Fahr., and told the midwife to repeat the same in the evening, and to send a messenger in the evening to report the case to me. Owing to the weather, and the surroundings of the premises, the temperature of the room could not be kept up, and at my visits I found the room from 67 to 70° Fahr. Evening report favorable.

April 4th. Pulse 104 ; temperature 100 ; respiration 18 ; slept well, but vomited three or four times ; no pain ; feels cheerful ; drainage tube discharging matter freely ; continued treatment as before, with the exception of brandy, which she thought made her sick. Evening report favorable ; no changes.

April 5th. Pulse 102 : temperature 97½ ; respiration 16 ; did not rest well during the night ; had to use the sedative mixture pretty freely ; still no pain, but a sick feeling in her stomach ; vomited twice ; drainage tube changed from a gum elastic to a silver one ; matter offensive. Dr. P. J. McCormick and myself redressed the wound ; found it united by union of first intention, and looking healthy. Dressed it with carbolated oil and lint, over which a flannel bandage was placed, and at her own request had her turned on her side, which we understood had been done several times previously without our knowledge. Injected carbolic acid water, 1 to 40. Evening report still favorable.

At 11 o'clock, P.M., a messenger came and informed me that Mrs. R. had hiccough, and was sick at her stomach. In questioning him closely, I could not find that any serious changes had taken place, as she had had slight hiccough before. I asked him if they wanted me to come out to see her. He told me no ; the midwife had sent him only to get directions what to do. I told him in writing, so he would not forget it, to give the milk and lime water in equal quantities, ad libitum, a teaspoonful of brandy in two of water, every two hours, without sugar, and to give the sedative mixture every half hour, until sleep was induced. I called at 7 o'clock, A.M., and was astonished to hear that she had died about an hour before my arrival. They informed me that the hiccough ceased shortly after the lime water and milk was given in small quantities and repeated doses, and that she enjoyed a refreshing sleep till about 3 o'clock, A.M., when she suddenly awoke, screaming with pain in the abdomen, and remarked she felt like having an action of her bowels. At the same time she had difficulty in breathing. She lay in a kind of drowsy state until she died, and was, when called upon, perfectly rational to the last moment. An hour after death her body was covered with dark blotches.

Remarks.—Was the immediate cause of death septicæmia ? or was it from collapse from carbolic acid poisoning ? The abdomen after death was not in a tympanitic condition, nor were there any signs of inflammation whatever. It would have been very desirable if I could have got a post-mortem examination, which I urged. I am satisfied, however, if we had attempted to remove the entire adhesions of the tumor, our patient would have died on the operating table.

Dr. Winkler, of Dresden, reports a similar case, where the patient died on the fourth day after the operation, from septicæmia.

Prof. Schrœder, of Berlin, reports, out of a series of fifty cases of ovariotomy, seven deaths, and all seven were difficult and complicated cases. He remarks as to septicæmia, "That it appears impossible, even with the strictest antiseptic precaution, to be absolutely certain of excluding septic germs from the abdominal

cavity. He also thinks that while a few such germs might be nearly innoccuous to a healthy organism, they acquire greater virulence in a depressed and diseased subject, with numerous wounds to afford them a congenial proliferating surface."

Could the carbolic acid water used to clean the abdominal cavity and to act as a disinfectant, have injured the case before us by means of absorption? She never complained of its use, and there was no signs of poisoning by the acid; nor can I believe that the amount of carbolic acid used could have caused that effect, as most of the carbolic acid water returned with the discharge. Dr. Peaslee and Dr. Kæberlé used disinfectants in the same manner for weeks, with very happy results, and speak very highly of this treatment as a preventive of septicæmia, and seem to think it to be a most important adjuvant in such cases.

Was it nervous prostration? I cannot help but think that in an operation of such magnitude and peculiar nature the shock imparted to the nervous system will attack, even in a latent manner, the nerve centres, thereby lessen vitality, and directly or indirectly cause a collapse of the whole organism, with death as its result.

CHLORAL LOCALLY IN DIPHTHERIA.

BY H. L. HORTON, M.D.,
Of New York City.

Some time ago I noticed in a journal, I think the REPORTER, a short abstract from some foreign periodical, stating the beneficial results obtained from the topical application to the throat of a rather strong solution of chloral hydrate, in cases of diphtheria. I cannot remember any more about it other than that it had been used, and successfully. I was pleased to learn that it had been adopted by somebody besides myself, although in that case it was used locally and uncombined with anything except water, while with me it was used combined with another remedy, perhaps as useful, or even more so, than itself, and, moreover, prescribed internally. The satisfaction I experienced in reading the article is the cause of my communicating to you the result of my experience, which, though too limited to base any positive conclusions upon, is yet sufficient, I think, to warrant a further trial of the combination. I would, therefore, request such of your readers as have more extended opportunities than myself, such as those who are practicing in institutions, or those who are unfortunate enough to be battling with the disease in its epidemic form, to give the following combination, or, if they think best, the chloral alone, a thorough trial, and report their success or failure, as it may be, in the columns of the REPORTER.

Just six months ago I used for the first time, in a case of scarlet fever in a child, three years old, the following combination, the disease being ushered in by convulsions:—

℞.	Sodii. bromidi.,	gr. xl
	Chloral hydratis,	gr. xx
	Ess. gaultheriæ,	℥ ij
	Syrupi tolu.,	℥ ijss M.

SIG.—Give the bowl of a teaspoon half full each half hour.

The medicine to be given day and night, neither mixed with nor followed up by anything whatever. The food, which consisted of milk, was always given before and in no case after the medicine. These directions were strictly followed. The dose being small in bulk and comparatively palatable, was often given when the child was not fully conscious that it was being administered. After the first forty-eight or seventy hours of the disease were passed, the intervals between the doses were gradually lengthened, in order that the patient might have longer periods of repose. My object in repeating the dose at such short intervals, making, as it were, one continuous dose, was mainly that the remedy might be continuously, or as nearly so as possible, in contact with the whole of the diseased surface, as well as the greater portion of that which was liable to become the seat of diphtheritic deposit. Such a procedure not only insured a continuous local action of the medicine, if it had any, but at the same time it was equally well calculated to keep up a gentle and even constitutional effect, which effect I consider it important to secure in most diseases, and especially in scarlet fever, where there is usually so much nervous irritation, which has as damaging a result upon the system as friction has upon a delicate piece of mechanism when it is lubricated only at long intervals. We thus derive not only all this benefit, but much more than could possibly be gained by making the application with a brush, as we thus save the strength of the patient, which would otherwise unavoidably be expended by resistance to our operations on his part, inasmuch as the applications, to be of any material service, would require to be repeated more or less frequently. We must further remember that however skillfully those applications may be made, it is next to impossible, in many cases, to avoid wounding or irritating such part of the membrane as is

not the seat of diphtheritic deposit, thus creating a most fertile soil wherein the poison may find a fresh footing. Again, when we leave directions for an unskilled person to make such applications every hour or two, imagination can only conceive how bunglingly it would be performed, and the amount of damage which would be caused, to say nothing of the worse than useless suffering which would be inflicted. In speaking thus strongly against topical applications in diphtheria, I may say that it is due to no recent conclusion of mine, as I have looked upon them with the same disfavor for years. The only exception I would make to my statement would be washing out the nares by injections of some mild disinfectant when the disease invades the schneiderian mucous membrane, to prevent absorption of septic material by the lymphatics with which that membrane is so freely supplied, and thus to avert or prevent death by septicæmia. I would also except the case where the amount of diphtheritic deposit in the throat is so great as to immediately endanger the life of the patient, or where the patient is of sufficient age and fortitude to remain perfectly still during the application; a case of the latter class is, however, quite exceptional. But I find I am going far from my subject.

I should have said that the patient, the treatment of whose case I have briefly narrated, contracted the disease from an elder sister, who died of scarlet fever, accompanied by diphtheria in a severe form, which was treated in the usual way, with iron, quinine, alcohol, etc.; consequently, I had, not unreasonably, gloomy forebodings, not only as to the future of this case, but also as to the fate of a brother about one year younger, who, in fact, was afterward attacked with the disease, although not in as severe a form. Both patients recovered, having been treated exclusively with the chloral and bromide. Since that time I have treated, in the same manner, a number of cases, the dose always being proportioned to the age of the patient, both where the disease was immediately preceded, or accompanied by scarlet fever, and where it was uncomplicated by any other disease. Two of such cases were adults, one near and the other at the middle period of life. One of these was the most severe case of diphtheria that I have had to treat since I have used the chloral combination. The case was far advanced when I first saw it, but it soon either ceased of its own accord, or was arrested by the treatment, inasmuch as convalescence soon commenced. In no one of my cases of scarlet fever in which I commenced this treatment at once do I remember to have seen even a slight diphtheritic deposit, although some of them were quite severe cases. In two patients, one aged 13, the other 19 years, the temperature reached 106½° Fahr.; yet in neither of these cases was any other treatment employed than the one above mentioned, except sponging with cool or cold water, continued long enough to reduce the temperature to and keep it at 102°, or near that, and occasionally oiling the surface, to allay the pruritus. In these cases the pharyngeal mucous membrane assumed a deep livid red color, but in neither case was there observed the least appearance of a diphtheritic deposit. One of my other cases, if my diagnosis was correct, was laryngeal diphtheria. An elder sister also had diphtheria, which, however, assumed a mild form; whether the latter fact was due to the treatment, or other causes, I know not. In the case of this little boy, on the second day after the appearance of the deposit on the tonsils a hoarseness manifested itself, which slowly increased, until there was complete aphonia; the respiratory movements at the same time were moderately impeded. In this case also no other treatment than the chloral and bromide was resorted to, except that the atmosphere of the room was moderately impregnated with the vapor of water and carbolic acid. There was no alcohol or beef tea given. The patient recovered. I believe that I have employed all the various kinds of treatment for diphtheria recommended by the standard authors, and some which are recommended by writers who cannot be classed as such; yet I must confess that I have met with greater success with the chloral and bromide than with any other remedy, or combination of remedies, that I have ever employed, as thus far all my patients have recovered, and all without that much dreaded sequel, albuminuria. I have stated that I have not had to treat a severe case of diphtheria accompanying or following scarlet fever. This may have been due to other causes than the treatment. All I can say is, that I saw all my cases, with but one exception, at a very early stage of the disease, and that they were all, without exception, under excellent hygienic conditions; also, that the pharyngeal mucous membranes were kept almost continuously bathed with the medicine. You might ask me for my theory as to the action of the remedy. I answer that I do not think it advisable to speculate as to how we shall pass a ford any great length of time before we reach it. If we do we may find when we have reached it that we have wasted our time, and that the stream is not of such size as to be worth

the consideration bestowed on it. In conclusion, I will say it is not theory that we want, in therapeutics especially, but solid facts, upon which we may base our theories. As man is the only animal that asks the question why, we can, and probably shall continue, to theorize, each for himself, and, undoubtedly, when any one has constructed a theory of his own he is much better pleased with it than with one which has been furnished him by another. But whether a theory be our own or propounded by others, let it, particularly in this department, be founded upon unquestioned and unquestionable facts. I desire, therefore, to be understood as stating herein only my personal experience, and not as claiming that my treatment will prove a specific for that dreaded disease. If, upon thorough trial, my experience should be found to differ widely from that of others, I, of course, shall have to attribute my success to causes other than the remedies used by me, but, as I regard the matter at present, I must consider it as directly the result of such treatment.

Medical Societies.

ARKANSAS STATE MEDICAL SOCIETY.

The Society met at Little Rock, May 22d. Dr. A. A. Horner, President, in the chair. An address of welcome was read by Dr. Geo. C. Hartt.

The annual address was then delivered by A. A. Horner, M. D., President of Helena, and President of the Phillips County Medical Society, from which we make the following extract:—

This Society, organized by the medical men of the State who were unwilling to longer remain entirely behind those of the other States of this great nation, has worked along to this its fourth annual meeting, endeavoring, unaided, to not only place the profession on an equal footing with those of its sister States, but to advance science, and thereby elevate all departments of the State government, as well as to relieve and mitigate the disease and suffering of the entire population of the same. The first has been partially accomplished by getting all those members of the profession who have connected themselves with the organization, and they, I believe, constitute the majority of the best educated men of the profession in the State, and by their united and vigorous efforts to have the Society reorganized by the American Medical Association, the most intelligent and respectable medical organization in the nation, and probably equal to that of the most enlightened countries of the earth. By such action on the part of that Society, we have all the avenues of assistance open to us under their laws, as well as their active support, also placing us on an equal footing with the societies of all the other States of this great Union. Thus far, you see, we have progressed. Now it is left to us, as members of this Society, individually and collectively, to make this Society the equal if not the superior of any of our sister societies. In the other States it has been thus far found indispensable to have the assistance of the strong arm of the law, consequently the legislatures of the various States who have regarded the lives of their citizens of any value to the State, have enacted various laws for the protection of their health, and fostering the advancement of medical science. In this they have acted wisely, not only as humanitarians, but in furthering every interest of the people of their respective States, for it is a fact that all can easily verify by taking the trouble to make the necessary investigation, that all nations, both ancient and modern, have flourished just in proportion as they have made provision for the health of their people, and this enlightened age nor this great country is no exception to this historical rule, for the statute books of all of our most prosperous States show that legal provision has been made for the care of the health of their citizens, and the amelioration of the condition of their afflicted. Thus far our law makers have only referred the bills which have been introduced into the Legislature to committees, for their action, and there they remained, notwithstanding a Committee of the American Medical Association has for the past three years urged upon the Governor of the State the great necessity for the establishment of a Board of Health; and to the credit of our last and present Governors, they both have called the attention of the Legislature, in their messages to that body, to the great necessity for such an institution, to say nothing of what has been done by this Society. The majority of our law makers have always been averse to the passage of any laws advocated by the profession, terming it class legislation.

As medical men, we desire no special legislation, being amply able to protect ourselves. What we desire is to protect the people from the quack and charlatan, who, driven by the more intelligent legislation of our more prosperous sister States, find a location here, and with their fine speeches, songs and banjos, are engaged in vending their nostrums to the less intelligent of our citizens, and annually carry enough money out of the State to defray the expenses of a most efficient Board of Health for half a dozen years.

The Secretary, Dr. R. G. Jennings, then read the names of members and applicants, and submitted his annual report. The following resolutions were reported by a committee and carried:—

Resolved, That we do not regard the delegates from the Arkansas State Medical Association as entitled to registration, as they do not represent the Society recognized by this body, but we do this without prejudice to the professional standing and character of the individual delegates.

Resolved, That no man can become or remain a permanent member of the American Medical Association unless he belongs to a local or State Society, recognized by the American Medical Association.

Also, it is the opinion of the Judicial Council that the American Medical Association can re-

cognize the jurisdiction of only one State Medical Society in any State.

Dr. Linthicum, of the Committee on State Board of Health, submitted the following report:—

Mr. President and Gentlemen:—Your committee, appointed at our last meeting, upon "State Board of Health" or medical legislation, beg leave to report that they attempted a discharge of the duties assigned them. Three bills, one for the creation of a "State Board of Health," one to regulate the practice of "medicine and surgery," and one to establish a "State Board of Pharmacy" for the State of Arkansas, were drawn and presented to our last General Assembly, and very many letters were written to various members of said Assembly, bringing to bear every influence in the power of said committee to secure their passage. The two first reached a hearing before the house, and were referred to the committee on emigration, where they were allowed to slumber, and finally die, without being reported upon. The bill to establish a State Board of Pharmacy never obtained a hearing. The Lunatic Asylum bill passed both houses, but in such an unsatisfactory and crippled shape that executive disapproval became a necessity in order to protect the financial interests of the State, as well as the interests of her feeble-minded citizens.

The last sentence was subsequently withdrawn by the committee, and the remainder of the Report was accepted.

The Judicial Council, to whom was referred the question, can a local society as a body offer charitable services to a corporation, reported that free clinics by medical bodies or colleges are not in conflict with the code, though they are liable to abuse, and should be conducted with much care and discrimination. A medical society being in fact a college of medical men, may, within the code, exercise this office. The intent and meaning of paragraph three, article one, Code of Ethics, reprobating publicly offering advice and medicine to the poor, gratis, etc., refers to the conduct of individual members of the profession, and not to colleges or corporate medical bodies. But we do not think this eleemosynary tender of services should be made to a corporation, unless said corporation requests the favor, or is well known to be unable to employ and remunerate a physician.

Corporations maintaining a charity hospital do not fall within the purview of this opinion. Such corporations must employ a hospital physician.

Various papers were then read, among which Dr. Hawkins reported from Dr. Breedlove a case of sickness—fourteen persons—from eating boiled custard, producing acute dyspepsia or cholera morbus. The article strongly opposed the using of vanilla as a flavoring extract, which contained an oil which, when old, became very rancid.

Dr. Christian reported a similar case from eating ice cream flavored with vanilla.

After some further papers, the Nominating Committee submitted the following report of officers, all of whom were elected:—

President, E. T. Dale, of Texarkana.

First Vice President, W. M. Lawrence, of Batesville.

Second Vice President, J. B. Cummings, of Forest City.

Third Vice President, Albert Dunlap, of Fort Smith.

Fourth Vice President, J. T. Hamilton, of Pine Bluff.

Secretary, R. G. Jennings, of Little Rock.

Assistant Secretary, L. P. Gibson, of Little Rock.

Treasurer, A. L. Breysacher, of Little Rock.

Librarian, J. H. Lenow, of Little Rock.

It was also decided that the next annual session of the Society be convened at Little Rock, on the first Wednesday in May, 1880, at 11 o'clock A.M.

Cold Douche Treatment of Traumatic Meningitis.

At a recent meeting of the Clinical Society of London, Mr. Keetley related the particulars of a case of severe traumatic meningitis treated in the stage of coma by the cold douche for two hours and a half. The patient, a groom, aged thirty, was thrown from his horse into a ditch, alighting on his head. There had been a short period of insensibility, but on admission into the hospital he was conscious and irritable. The accident had happened at five o'clock in the afternoon, and at six the next day, having passed a quiet night, he was seized with a convulsive attack, confined to the left side. During the day he had several similar seizures, in which his eyes were strongly turned to the left; in the intervals he vomited occasionally. On the third day he remained in much the same condition; but on the fourth the right side was affected; and after the attack this side was found to be paralyzed. Toward evening he improved considerably; and on the following day it was noted that his face was heavy, his pupils contracted, and he resembled a patient suffering from opium poisoning; the temperature was 100°. On the sixth day the coma was increased; temperature 100°, pulse 120. The cold douche was applied to the head for two hours and a half. The temperature was 99°, pulse 70; his face rather blue. He could answer questions, but had a fatuous expression, and his answers were often childish. After this time he steadily improved, and ultimately recovered. A fracture of the posterior fossa was diagnosed, extending to the base of the skull, the severity of the injury and the severity of the meningitis appearing to point to such a condition. The epileptic seiz-

ures at first appeared to point to an injury of the dura mater over the seat of violence; and the later attacks on the opposite side to an extension of the inflammation to the meninges of the other hemisphere. There was no difficulty in regulating the time during which the application of the douche was beneficial. The blueness of the lips was only noticed after more than two hours of this course of treatment. It should be added that he had previously been treated by an ice bag to the head and the administration of aperients.

Pilocarpin in Syphilis.

The following two cases are reported in the *Medical Times and Gazette*, by Dr. C. B. Lockwood:—

John S., aged eighteen, a fisherman, had been treated as an out-patient at the Lock Hospital since October, 1878. Owing to exposure his syphilis was aggravated; and when admitted in November, 1878, his body, head and limbs were covered with small, dry, rupial crusts, which, coming off, left here and there deep reddish-brown discolorations. He had mucous patches on soft palate and tonsils; his gums were vascular and retracted. He had double iritis. For fifteen days (January 2d to 17th) he was treated with bichloride of mercury and iodide of potassium, without improvement. Calomel vapor baths were next tried for thirteen days (January 17th to 30th). As no improvement was seen, the calomel was reduced from fifteen grains to five grains, and one-sixth of a grain of nitrate of pilocarpin was given hypodermically every other day before the bath. Before this the baths had caused no sweating. Sweating was now so profuse that it ran off the patient on to the floor, continuing from 7 P. M. until 4 A. M., wetting his bedclothes through and through. He at once began to improve, and on March 7th, after about thirty-three days' treatment (fifteen baths), all the crusts had fallen off, the stains were fading, his throat was well, and the eyes were but slightly pink. He desired his discharge, and reports himself at the out-patient room, where he is being treated with half a grain of hyd. iodid. every night. The stains are slowly fading.

In the foregoing case much mercury had been used. J. S., aged twenty-seven, has had, as far as I know, no mercury. He presented himself in the following condition:—Body, limbs and face covered with a bad tubercular psoriasis; slight ulceration of both tonsils; remains of hard sore. February 17th: One-sixth of a grain of nitrate of pilocarpin given hypodermically. Profuse sweating began in six minutes, and lasted three hours and a half. Pilocarpin was repeated from February 18th to 20th, then every other day until March 6th, when the sore was well, and only fading stains remained where the rash had been, but his throat was not quite well. He considered himself nearly well, and in spite of remonstrance desired his discharge. He has not again presented himself, as promised.

These cases are both incomplete, but the result has been so encouraging that I publish them, in the hope that others may prosecute inquiries in the same direction. I have no doubt that in jaborandi we have a means by which certain cases of syphilis can be helped toward recovery.

New Exp riments in Anæsthetics.

The Paris correspondent of the *Lancet* writes—An experiment of considerable practical interest was performed a few days ago by MM. Labbé, Bert, Preterre, Lafont, and Regnaud, for the purpose of testing the practical applications of Professor Bert's researches on the anæsthetic properties of mixed nitrous oxide and oxygen *under tension*. You are doubtless aware of the character of M. Bert's researches, which were communicated to the Academy of Sciences in one of its recent sittings. But the experiment to which I allude was a practical one, applied to a human being. A chamber with compressed air having been prepared, the experimenters entered it with a young woman of twenty, who was to be operated upon for that most painful operation, ingrowing nail. As soon as the barometer marked an increase of pressure equal to 0.17 centimetres, M. Preterre, the well-known dentist, applied the apparatus which he is in the habit of using. There was a sudden cessation of breathing, which lasted about fifteen seconds. Then a long inspiration followed, and after ten seconds there was complete insensibility. Dr. Labbé now proceeded quietly and leisurely with the operation, followed by the dressing. All this took about eight minutes, during which time the patient slept quietly, with a regular pulse, and a clear, rosy complexion. On waking up she immediately felt the pain, and had a sort of short, hysterical fit, with crying. But she declared when it ended that she felt quite well and very hungry, as she had not had anything yet to eat. The assistants were struck with the way in which she recovered her normal condition, as she was able to walk immediately, and to resume her habits. The value of this anæsthetic mixture of about eighty-five parts of nitrous oxide and fifteen of oxygen, administered *under tension*, and discovered by Prof. Bert, therefore promises to be very useful and practical. With this mixture, employed in compressed air, the patient does not get blue in the face, and the natural complexion, pulse, and breathing seem to be preserved. Moreover, it is not preceded by the period of agitation which often proves so tedious and troublesome, and is not followed by the stage of reaction which often upsets a patient for several consecutive hours.

An Undescribed Form of Respiratory Disease.

In a paper read before the Detroit Medical and Library Association, Dr. Carstens, of Detroit, says—

A new disease has swept over our city, which came, none know where from. I call it a new disease, as I cannot find any description of such an epidemic in any of the text books, nor has any physician been able to tell me the name. It is certainly not the "influenza" or epizootic which spread over the land a few years ago, attacking man and beast; the symptoms are different. The patient will generally first complain of a sore

throat; by inspection we will find an erythematous blush on the pharynx and soft palate, extending down the larynx to the bronchial tubes. This redness often commences on one side and extends to the whole mucous lining of the throat. No difficulty in swallowing is experienced, only a slight pain, with tickling and constant desire to cough. The lymphatics of the neck are enlarged, but the patient calls especial attention to a stiffness in the trapezius and muscles of the back of the neck. Accompanying this are neuralgic pains around the shoulder, and running down the arm, generally only on one (the left) side, sudden, sharp, colic-like pains in the bowels, of short duration, but frequently recurring; the bowels sometimes loose, most frequently constipated; anorexia and nausea; fleeting pains in the joints, slight bronchitis, probably caused by the extension of the throat trouble; headache slight, general malaise, in fact, the patient complains of great prostration. To these symptoms are added a fever of malarial character, generally worse at night. This almost always subsides in two days, even without treatment; temperature rising in my cases not over 101 degrees.

Some of the above symptoms are absent in some cases, but the constant distressing cough and throat trouble, never. Many cases got well without treatment, or by the use of household remedies, but some would linger along, and only improved, even after other medication had been tried, after the use of a good dose of quinine, say twenty-five grains, in the course of a day. Cases under my own treatment I would generally give quinine first, and then a cough mixture, with five grains each of chloride of ammonium and iodide of potassium. With this treatment the symptoms subsided in a few days.

The Treatment of Mydriasis.

The eminent oculist, M. De Wecker, remarks on this subject, in the *Gazette des Hôpitaux*—

The treatment of mydriasis must evidently vary according to whether it is paralytic or spasmodic. All mydriases of paralytic origin are generally accompanied by a paralytic lesion of the ciliary muscle, while spasmodic mydriases ordinarily leave the muscle of accommodation intact. It will, therefore, most frequently suffice to investigate the *power of accommodation* in order to determine whether the probable cause of the mydriasis, be paralytic or spasmodic. If a patient, the subject of mydriasis, presents no disturbance of accommodation, we may declare that the cause of the mydriasis is spinal; while, if the integrity of this be not preserved, the cause is cerebral. In this latter case the disturbances of accommodation are easily recognized. Thus, the subject of hypermetropia, not being able to accommodate the eye regularly, is unable to see distinctly, whether near, or at a distance; in emmetropia there is no longer clear perception of near objects; and in myopia the faculty of reading is reduced to the vicinity of the *punctum remotum*. One or other of these conditions, according to the case, will then indicate a cerebral lesion as the cause of the mydriasis. Of course, all the subjects of mydriasis, whether paralytic or spasmodic, complain of the dazzling produced by light, dependent solely on the dilatation of the pupil; but this occurrence will not be confounded with disturbance in accommodation, properly so called. Mydriasis of *spinal* origin is a symptom of great value in prognosis, and often so in the diagnosis of these affections. Thus, it is an anticipatory symptom of locomotor ataxy; and in general paralysis it is also of great value. Still, it must not be forgotten that in these affections it is only transitory. We should abandon the modes of treatment formerly employed, the sole admissible indication seeming to be the dropping into the eye a solution of eserine or pilocarpin made into a collyrium with five centigrammes of distilled water. After using the collyrium we must observe how long the effect continues, as it is by the duration of its action in inducing contraction of the pupil that we should be guided—the interval of each instillation being rendered more and more long according to this duration. If, however, no change is observed, it is useless to tease the patient with an application which is scarcely palliative. Advantage may be derived also from the continuous electric current.

Administration of the Sulphides.

Dr. G. V. Poore writes, in the *Lancet*—

Any one who has employed the sulphides in the treatment of disease must have been alternately pleased and disappointed; for, although the effect produced is often exactly that which Dr. Ringer describes in his "Handbook of Therapeutics," equally often, if not more often, the result appears to be absolutely negative. One reason for this is undoubtedly to be found in a faulty selection of cases; and it may reasonably be hoped that an increasing knowledge may cause a diminution in the number of patients who, having been treated with sulphides, have failed to derive the expected benefit. Another reason is also to be found in the great instability of the sulphides themselves, which immediately oxidize on exposure to air; and it may safely be said that a very large proportion of the patients for whom the sulphides are prescribed get scarcely a single dose of the medicine which it is desired to give them, but receive in lieu of it a quantity of harmless or inactive sulphate.

When prescribing sulphides, it has been my invariable custom to advise the patient to get very small quantities made up at a time, and to warn him that unless the medicine has the familiar odor of rotten eggs it can do him no good. Better than giving a solution of the sulphides, is to allow the patient to have a small and well-stoppered bottle, filled with potassium or calcium sulphide, whence he may take his dose, roughly estimated on the point of a penknife, as required. Good service has undoubtedly been done by the introduction of the sulphides in perles, and I have reason to believe that the sulphide remains unoxidized in the perles for indefinite periods. I have lately, however, seen a sample of so-called "perles of sulphide calcium," which, on examination were found to contain no sulphide at all. The best way of all, no doubt, to prescribe sulphides, is to send the patient, if possible, to a so-

called sulphur spring, where he may drink the water impregnated with hydrogen sulphide, and holding other sulphides in solution before oxidation has had time to occur. Then one may be sure that the medicine prescribed is actually being taken.

On Cysts of the Mouth.

Mr. Francis Fox read a paper before the British Association of Dental Surgeons, on "Cysts of the Mouth." After alluding to the oral mucous membrane being not infrequently the seat of cystic disease, owing to the numerous small glands and follicles in this situation, and that the mere occlusion of the duct of one of these may give rise to the formation of a more or less extensive tumor, Mr. Fox observed that these cysts may be congenital, or may rise subsequent to birth, in consequence of some morbid action set up in the mucous membrane. The term "ranula" has been, and still is, applied to all cystic formations in the sublingual region, and he could not suggest a more appropriate appellation, provided we do not associate the name with any special pathological change, but regard it as simply descriptive of the impression which such tumors make upon the observer. Ranula, then, may depend upon (*a*) obstruction of the outflow from the minute follicles or conglobate glands; (*b*) it may be connected with the Whartonian, or one of the larger ducts, or (*c*) it may be in no way connected with the mucous structure itself; (*d*) it may depend upon inflammation of the bursa, which is placed between the genio-hyoglossi muscles. Similar cysts to these ranulæ occur in the mucous membrane of the lips and cheeks, and are often met with on mucous surfaces in other regions of the body. Their treatment is simple. If due to local inflammation, a small puncture will quickly effect a cure; or, if the orifice of the duct can be discovered, a small probe may be inserted; or if arising from a salivary calculus, an incision into the duct will permit the easy removal of the concretion. If the enlargement be excessive, a seton of a few threads of silk may be passed through the tumor, so that the contents will gradually escape, and inflammation be set up. This may give rise to an excessive amount of inflammation, and occasion much secondary mischief, and a better course of procedure might consequently be to puncture the tumor, and then apply caustic to its internal surface. It may be necessary to remove a portion of the cyst wall, in which case the more vascular portion of the tumor should be avoided. Ranula connected with the duct of the submaxillary gland is dependent upon dilatation of its coats, in consequence of obstruction at its orifice or in some part of its canal. Calcareous deposit is the commonest cause of obstruction, and these salivary calculi attain often a very great size, and are amenable to the same treatment already mentioned. There is still some difference of opinion with regard to the exact pathology of these sublingual cysts. Some maintain that they are invariably connected with the large salivary glands; others, that they occur quite independently of these ducts, and are, or nearly resemble, "mucous cysts." The fluid which they contain does not resemble saliva in its chemical composition, and there is an entire absence of the sulpho-cyanide of potash, which is so constantly found in true salivary secretion. Ranula situate in the submucous tissue is generally larger, and closely resembles sebaceous tumors, and contains a thick, putty-like substance, composed of epithelial scales, cholesterine, and oil globules. It is of rare occurrence, and the cyst walls are usually very thin and more or less adherent to the neighboring tissues. The removal of the entire sac and contents is the most satisfactory treatment where practicable. Ranula arising from an inflamed bursa should be treated on the principle of destroying the secreting surface, and thus curing the disease. Sanguineous or venous cysts are of rare occurrence in the mouth; when, however, they do occur, they are usually seen on the lips near to their free border. Sir James Paget regards them as "dilated portions of the blood vessels, shut off, as it were, from the main stream. They are usually congenital, and, as a rule, do not increase in size. When small and superficial they may be dissected out, but when deep-seated a ligature or seton will often effect a cure. Cysts known as dentigerous cysts are usually confined to the alveolar portions of the maxillæ, and do not come within the scope of the present paper. Cysts formed in the tongue itself, and consisting of dilated mucous follicles, are difficult to diagnose, and may readily be mistaken for malignant disease. A puncture with a grooved needle will generally solve any doubt as to their nature. Their treatment consists in opening the sac and irritating the lining membrane by means of a probe or otherwise.

Impacted Urethral Calculus.

At a late meeting of the Medical Society of London, Mr. Teevan read a paper on the Diagnosis and Treatment of Impacted Urethral Calculus. The stone might come from the kidney, bladder, prostate, or be formed in the urethra, in which latter case it was usually phosphatic and elongated. Oxalate-of-lime calculus was more likely to become impacted than a lithic-acid or phosphatic one, as it was often irregular in shape, rough and spiculated. The stone, when it caused retention, might be mistaken for an enlarged third lobe of the prostate, or a rough, gristly stricture. A calculus could not always be felt through the urethral wall, when situated in the deeper portion of the canal. Its presence was usually announced by a sudden interference with the act of micturition; sometimes, but not always, attended with great pain. A pathognomonic sign was, he believed, the forcible expulsion of the urine in several streams instead of one. If a stone were left *in situ* it usually gave rise to retention, ulceration, or extravasation. When a calculus was impacted in the fixed portion of the urethra, the best way was to try to push it back into the bladder by means of a wax bougie, the end of which had been slightly warmed. Once in the bladder, it could be easily and quickly crushed. If in the penile urethra, an attempt might be made to extract it, and if it could not be moved either forward or backward, it must be

cut out. All incisions into the penile urethra should be valvular, otherwise a fistula might remain. After perineal incision, the patient should begin to withdraw all his urine by catheter on the fourth day, to hasten the closure of the wound; but it was useless and injurious to tie a catheter in the bladder. In boys incision would be more frequently required than in adults, and should always be had recourse to if the stone was in the membranous urethra.

Ovarian Pain in Pregnant Women.

Dr. Budin, Chef de Clinique d'Accouchements, calls attention (*Progrès Médical*, No. 9) to a vivid pain which is sometimes produced during the latter months of pregnancy, and during labor, by a very moderate amount of pressure made on the abdomen by the ends of the index and medius fingers. The pain is sometimes so sharp that it causes exclamations or tears to start in the eye. It never occurs spontaneously, and its production is confined to the vicinity of a line drawn from the umbilicus to the anterior superior spine of the ilium, sometimes a little above, and sometimes below this line, and at a distance varying from ten to fifteen centimeters from the umbilicus. At the seat of this pain so excited may be felt a movable body resembling the ovary in shape and size. Its presence is most frequently felt on the left side, the existence of a resisting surface —usually the back of the fœtus—being necessary in order for the body to be felt and the pain to be excited. Sometimes this can only be done during the contraction of the uterus. Dr. Budin thinks it possible that this "ovarian pain" has been confounded with certain neuralgias which several authors have termed rheumatism of the uterus, and with the pain sometimes caused by the pressure of the head on the uterine wall. It is sometimes very easy to distinguish also the round ligament, but pressure on this causes no pain. None of the women upon whom this tenderness has been produced were hysterical.

Singular Wounds of the Heart.

Dr. Boileau narrates this case to the London Pathological Society. A private soldier, when "skylarking" with his companions, received a wound in the chest from the blade of a knife, which flew out of the handle as the instrument was being brandished by another soldier. After the reception of the wound, the man went up fifteen steps, and then ran a distance of two hundred yards in the direction of the hospital, when he fell speechless, and expired in five minutes. There was no external hemorrhage, but the pericardium was found full of clotted blood. A punctured wound entered the right ventricle close to the septum, went through the septum, and passed out through the left ventricle near the apex. The cavities of the heart were empty. The interest of the case was in the length of time the man lived and in the movements he was able to accomplish after the reception of so serious an injury.

Sir Joseph Fayrer said there was in the Pathological Museum at Calcutta the heart of a soldier who had been shot at the storming of Rangoon, in 1852. The wound was in the left shoulder, and the lung was supposed to be injured. Sir Joseph saw the case at the time. After remaining in the hospital for a fortnight, the patient recovered so much as to be able to go to a convalescent home, after six weeks' residence at which he died suddenly. At the necropsy the bullet was found in the left ventricle, but how it got there was a mystery. There was no appearance of injury to the cardiac walls, and the conjecture was that the bullet must have dropped into the cavity through one of the vessels.

On Railroad Injuries.

Dr. J. Rigler, a recent German writer on this subject, sums up, as the quintessence of his researches, as follows:—

1. Localized anatomical lesions of the spinal cord may occur as the direct result of railway accident, even without any visible (external) evidence; or in the form of the so-called "railway spine," but only when the injured part is turned toward the point from which the concussion proceeds.

2. Injuries of the cord and its membranes, such as occur in railway accidents, when they do not immediately kill or tend to death, generally tend toward cure, so that the power of working may be recovered to a considerable extent, although it is never entirely regained.

2. Railway officials, as the result of accident, often become the subjects of a morbid bodily as well as mental condition, siderodromophobia, which chiefly manifests itself as "spinal irritation," so-called; and which may very easily be confounded with disease due to anatomical lesions of the cord.

4. Clever simulation (of disease) by those who have been concerned in railway accidents has, in consequence of new laws, become remarkably common; previously existing disease has been falsely attributed to accident on the one hand, while, on the other, real (but slight) injury has been grossly exaggerated.

5. A single examination, indeed, repeated examinations, often do not suffice to qualify a surgeon to pronounce an opinion on a given case. Long and repeated observation of the alleged injury, and an accurate knowledge of the previous general health, as well as a conscientious weighing of all concomitant circumstances, are always needed.

Effects of Elevated Regions on Phthisis.

At a recent meeting of the Medical Society of London, a paper was read by Dr. C. T. Williams, upon "Phthisis Treated at High Altitudes." The principal characteristics of mountain climates, such as those of Davos and the Engadine, in winter, were (1) the rarefaction of the atmosphere, as shown by the low barometric pressure, causing an increase in both pulse and respiration rates; (2) the dryness of the air, resulting from the low temperature; (3) the intensity of the solar radiation, enabling individuals to sit out of doors when in the shade the temperature was below freezing; and (4) the stillness of the

atmosphere. The author then adduced four cases in illustration of the good and bad effects of mountain climates. The chief influence of the climate of high altitudes is decidedly stimulating, increasing the appetite, improving the digestion, and quickening the respiration and circulation, the latter effect causing it to be unsuitable in cardiac and cerebral cases. The physical signs of the lungs rapidly change, a diminution in dullness (due either to absorption of the consolidation, to hypertrophy of lung tissue, or to localized emphysema) being more marked than any of the auscultatory phenomena. Pulmonary hemorrhage was less frequent. The cases least fitted are those where pyrexia exists, and all cases where the lungs are largely involved.

Reviews and Book Notices.

NOTES ON CURRENT MEDICAL LITERATURE.

——A polemical pamphlet on "Urethrismus or Chronic Spasmodic Stricture," is sent us by Dr. F. N. Otis, of New York city. He discusses at considerable length the mechanism of this form of stricture, and defends his theory of it, against that of Dr. H. B. Sands.

——In an article on Yellow Fever, read before the Medical Association of Georgia, Dr. J. G. Westmoreland, of Atlanta, attacks the principle of quarantine, and insists that malaria is an essential factor of yellow fever. Fortunately, both these opinions receive very small support from unbiased and able observers.

——Aspergillus in the living human ear is not very rare. In a monograph before us, Dr. C. H. Burnett gives twenty cases. It is also very contagious, being easily conveyed from one person to another. For its destruction and removal, carefully syringing the ear with alcohol, pure or slightly diluted, or with a solution of hyposulphite of soda, gr.iij to water f.℥j were the measures employed. The greatest gentleness is requisite in all cases of aspergillus in the ear, lest eczema be excited, since in all these cases the ear seems to possess a readiness to slip into the eczematous state. The investigations of Bezold, of Munich, have fully confirmed the fact that the use of oleaginous matters for the cure of ear diseases is very often the cause of the growth of aspergillus in the ear.

——The activity of the gynecologists is well illustrated by a number of reprints and monographs which we have just received, and which we can only mention by title and author.

Dr. O. E. Herrick, "Instrumental Interference in Uterine Displacements;" "Ulceration of the Female Urethra;" "Galvanic Treatment of Ulcerated Os Uteri."

Dr. Ely Van de Warker, "Impotency in Women;" "Normal Position and Movements of the Unimpregnated Uterus."

Dr. E. W. Jenks, "Perineorrhaphy."

Dr. T. G. Comstock, "The Obstetric Forceps."

Dr. H. P. Wenzel, "A Case of Protrusion of the Stump of the Pedicle through the Cicatrix, more than three years after Ovariotomy."

Dr. G. M. B. Maughs, "A Case of Enterocele Vaginalis Anterior."

Dr. William Goodell, "On the Relation of Neurasthenia to Diseases of the Womb."

Dr. S. C. Busey, "Alternating Anterior and Posterior Version of the Uterus."

Dr. A. Reeves Jackson, "On the Treatment of Sterility."

Dr. T. M. Drysdale, "Biographical Memoir of Washington L. Atlee, M.D."

The four last-mentioned of these are reprinted from the *Transactions* of the American Gynecological Society, the third volume of which, for the year 1878, has just been issued. It makes a handsome book of 472 pages, on fine paper, and neatly bound. We gave at the time of the session (which was held in this city) a full report of the proceedings and some of the papers. Besides those above mentioned, may be enumerated one by Dr. J. Marion Sims, "On the Surgical Treatment of Stenosis of the Cervix Uteri;" one on "The Necessity of Early Delivery," by Dr. T. Addis Emmet; "On the Hand as a Curette in Post-partum Hemorrhage," by Dr. H. P. C. Wilson; "On the Treatment of Post-partum Hemorrhage," by Dr. R. A. F. Penrose; "On the Treatment of the Acute Parenchymatous Nephritis of Pregnancy," by Dr. W. L. Richardson; and a number of others. All the Contributions are of a character to reflect credit on the Society and its annual volume. The Index of Obstetric and Gynecological Literature of All Countries, for 1877, prepared by Dr. J. S. Billings, U.S.A., is a most valuable feature for students, and one that we trust will be continued hereafter. The publishers are Houghton, Osgood & Co., Cambridge, Mass. Price $5.00.

——When cold is applied to the skin of the back of the neck in cats and rabbits, they run forward and leap up in the air; when to the same spot in pigeons, they exhibit retrograde movements, alternating with fits of stupor. How to explain these phenomena is the subject of a short paper by Dr. Isaac Ott. His suggestion is as follows:—

"The sensory fibres do not decussate in pig-

eons, and if an irritation is made on one side of the median line the impression ascends on the same side, and calls the retrogressive ganglia of that only into activity, which activity is expressed on the opposite side of the body, due to the motor decussation. Now, the retrogressive ganglia are in power over one side of the brain, while the other side of the brain, under the influence of the cerebrum, is disposed to move the opposite side of the body forward; hence the bird cannot go directly forward, but deviates to the side where the retrogressive ganglia have shown their activity—the bird moves in a circle. The action might be compared to that of driving a horse forward and at the same time strongly pulling one of the reins, the checking rein corresponding to the side of the brain under the influence of the retrogressive ganglia. If, now, the skin on both sides of the median line is irritated, then the retrogressive ganglia on both sides of the median line are dominant, and the bird moves backward, notwithstanding all efforts to prevent it. It might be compared to a horse pulled on his haunches by two strong check-reins."

The hypnotic state can be explained by sensory irritation, produced by the bisulphide of carbon, calling ganglia at the base of the brain into activity, which ganglia have an inhibitory power.

BOOK NOTICES.

Posological Table; including all the Officinal and the most frequently employed unofficinal preparations. By Charles Rice, chemist. N. Y., Wm. Wood & Co., 1879. 12mo, cloth, pp. 96.

This table gives the names of medicines, their doses, the formulæ of the U. S. Pharmacopœia, and of other pharmacopœias, and by certain arbitrary signs which remedies are poisonous, which require caution, and some other points. The doses are given in apothecaries' weight, and a table for converting them into the metric system is appended.

The book shows considerable labor, and general good judgment and accuracy, but we cannot but regret to see the old and erroneous rule for adjusting the doses for children under twelve years brought forward again.

Pott's Disease, its Pathology and Mechanical Treatment; with Remarks on Rotary Lateral Curvature. By Newton M. Shaffer, M.D. New York, G. P. Putnam's Sons, 1879. pp. 82.

An essay read before the New York County Medical Society gives the foundation for this little work. The details of the treatment of a number of cases are reported, and the devices of the author described. The pathology of the disease is discussed, and the principles of mechanical treatment explained. A few illustrations are added. The presswork of the book is poorly done, and no index is appended.

Transactions of the Rhode Island Medical Society for the years 1878-1879. Vol. II, Part 2. Published by the Society. pp. 160.

The proceedings of the quarterly meetings of the Society are given in considerable detail, and various original papers are appended. Dr. Charles O. Leary reported a successful case of trephining for epilepsy, and spoke in defence of the operation, and concluded: "From statistics, from my own experience, and from my investigation through the surgical literature of the subject, I come to the conclusion—notwithstanding the well defined opinions of Hamilton, Baron Larrey, Erichsen, and others, that the trephine is applied too sparingly in injuries of the skull; that in even simple fractures of the skull, where there is depression deep enough to infringe decidedly upon the brain, even without symptoms of compression, the trephine should be applied."

Dr. George Capron gives a long discussion of the management of puerperal convulsions. Of the prophylaxis, he remarks—

"For albuminuria, which will generally be found to be the cause or associated with these symptoms, there is probably no better remedy known than the bitartrate of potassa. My method of giving it is to make a solution of it with a little ginger and sugar in boiling water, of which I advise the patient to drink small draughts frequently until it has a moderate effect upon the bowels, and then to continue it in smaller quantities, until the symptoms disappear, or until labor comes on."

The subject of "mechanical dysmenorrhœa" was handled with considerable fullness by Dr. Virgil O. Hardon. He recommends for it incision of the cervix, and says of this operation: "It is not one which is still *sub judice* and which is based upon theoretical considerations alone. The experience of the last twenty-five years has amply demonstrated that incision of the cervix uteri for the relief of mechanical dysmenorrhœa, if undertaken at the right time and in the right way, is as successful and as free from danger as any of the ordinary operations in surgery."

Several obituary notices close the volume.

THE

Medical and Surgical Reporter,

A WEEKLY JOURNAL,

Issued every Saturday.

D. G. BRINTON, M.D., EDITOR.

The terms of subscription to the serial publications of this office are as follows, payable in advance:—

Med. and Surg. Reporter (weekly), a year,	$5.00
Half-Yearly Compendium of Med. Science,	2.50
Reporter and Compendium, - - -	7.00
Physician's Daily Pocket Record, - -	1.50
Reporter and Pocket Record, - - -	6.25
Reporter, Comp. and Pocket Record, - -	8.25

For advertising terms address the office.

Marriages, Deaths, and Personals are inserted free of charge.

All letters should be addressed, and all checks and postal orders drawn to order of

D. G. BRINTON, M.D.,
115 South Seventh Street,
PHILADELPHIA, PA.

THE QUESTION OF QUARANTINE.

When the infected districts on the Volga, around Wetlyanka, were surrounded by a sanitary cordon of the strictest kind, and absolutely all communication with the plague-smitten districts cut off, there were not wanting enthusiasts in England, Germany and this country who loudly condemned the whole procedure as sure to be of no good effect, to cause needless misery to the population shut in, to disturb the relations of commerce, and to excite the fears of the nation. Now that the result of that summary procedure has been successfully to stamp out the plague, we do not hear so much on that subject from the opponents of quarantine. Like other prophets, when their predictions fail, they think it best to keep silent.

Let the truth be told. The vilified and detested plan of quarantine has achieved a grand success; it has saved a nation, a continent, from a most dreadful epidemic. Let us be honest, and give the devil his due. Quarantine is not so useless after all.

For all that, sanitary regulations are not to be neglected. Whatever cleanliness and disinfection can accomplish, let us secure by observing them. But, *in addition to them*, let us have a quarantine of the most rigid possible character when the occasion is alarming enough to make it desirable. Let the general government enact the necessary laws and confer the requisite authority to carry them out. Let not the miserable jealousy of States and cities about their "rights" stand in the way of the good of the whole. Because we cannot have an absolute quarantine when needed, let us have the best we can.

Among the severe arraignments of the system of quarantine, that by Dr. J. C. LE HARDY, of Savannah (from the *Transactions* of the Medical Association of Georgia), is one of the most determined. It is an appeal to prejudice and self-interest, backed by *ex parte* statements, and shows these tendencies too strongly on its surface to influence unbiased minds. So long as the health of a community is held to be of second-rate importance compared to its money interests, just so long State medicine will be confined to the subordinate position it now occupies. So long as the local prejudices of a small section are allowed to imperil the sanitary condition of a great nation, will all measures fail of their best effect.

It is needless to refute in detail the arguments of those who oppose quarantine at any and all times, and who resist the establishment of general health regulations because they may conflict with what they consider the privileges of their city or State. Of course, it is easy to point out where quarantine has failed, and when all such cases are quoted, and *none mentioned in which it has succeeded*, the argument looks strong. It is also easy to show that quarantine interferes with business; but is it not also easy to prove that the introduction of an epidemic is still more destructive to economical interests? Has it been forgotten that the yellow fever in the Mississippi Valley last summer was supposed to have injured the monetary resources of the Valley to the amount of $50,000,000?

There has been too much partisanship in this discussion, too great anxiety to advocate extreme

and exclusive views. The middle ground, which recognizes the occasional great advantage of quarantine, and the invariable and immense value of sanitation, has not found the advocates which it deserves.

Notes and Comments.

Siderodromophobia.

This big word is derived from the modern Greek "siderodromos," railroad, and "phobos," fear, and is applied by Dr. Johannes Rigler, a German railway surgeon of long experience, to a peculiar mental affection of railroad employees. Dr. R. states that, as the result of their occupation, railway-engine mechanics become the subjects of an altered nerve condition, which he calls "irritation of the nerve-centres." It is the perpetual jarring, and shaking, and noise, which lead by degrees to this change, and which, under the influence of some unexpected shock, as in an accident, still further or more completely upset the nervous equilibrium, which ends, so to speak, in the condition known as "railway spine." This mental condition he names "Siderodromophobia," and defines it as "a more or less intense spinal irritation, coupled with a hysterical condition and a morbid disinclination for work, which, as the result of shock, occurs among railway *employés*, who, in consequence of their occupation, are specially predisposed to it." The author is unable to state whether this irritation is simply a congestion of the spinal cord, or whether it is to be referred to a dynamically altered nerve condition.

The Truth about the Climate of Nice.

Nice is much frequented by American and English invalids, and on several occasions we have pointed out that its advantages as a climatic resort are grossly over-estimated. We are glad to note that at the Therapeutical Society of Paris Dr. Grellety read a paper somewhat damaging as to the repute of Nice as a proper place of resort in phthisis. In this he points out the great variations of temperature, which occur to such an extent that the thermometer is often at more than 40° C. at full midday, while it indicates only 9° or 10° in the shade. If Nice were as salutary in phthisis as it is reputed to be, this disease ought to be rare among the inhabitants. This it is far from being, for its mortality from this cause among them is very high, compared to that of other cities. The statistics of the town, unfortunately, are purposely made erroneous, in order not to alarm visitors, and most cases of phthisis are registered as bronchitis, or as chronic disease. It is the same with regard to dangerous zymotic diseases, so that deaths in the epidemic of smallpox in December and January last were entered as occurring from acute disease or some other cause.

The Excision of Hard Chancres.

Dr. Auspitz, of the Vienna Polyklinik, has given the results of his experiments on the excision of hard chancres. Of thirty-four cases operated upon, thirty-two remained under observation; and of these thirty-two eighteen healed without any hardness, and the remaining fourteen healed with hard bases. In three of the thirty-two cases roseola and other general symptoms were present before the operation; two other cases did not remain long enough under observation, and four others exhibited a dubious result. Of the remaining twenty-three there were fourteen which healed without any hardness, and no constitutional symptoms were exhibited up to the time of last observation; the period of observation varied from four months to twenty. Of the nine cases in which hard bases were left, two showed very slight constitutional symptoms, while the rest showed well-marked constitutional symptoms. Less fully carried out experiments have also been made by Dr. Unna and Dr. Kölliker, and these have shown similar results.

Rest in Disease.

Speaking of the advantages of rest in disease, Dr. A. T. E. Linghurst classifies, in the *Lancet*, the varieties of rest as follows:—

1. Mental rest.
2. Bodily rest.
3. A combination of the above, as in that most perfect state of rest which we call "sleep."
4. Organic rest, as evidenced in the avoidance of exertion in cardiac disease; of talking, in affections of the respiratory tract; and in limiting, so far as possible, the act of deglutition in affections of the alimentary tract by the substitution of enemata.
5. Local rest, as secured by change in the position of body or limb, the use of pillows, cushions, etc.
6. Dietic rest, by avoiding the too frequent use of food and drink.
7. Medicinal rest, in the relief of spasm by inhalations, and the not too frequent administration of medicines, to the prejudice of nutrients or stimulants.

A Perilous Form of Mental Effort.

In an article on "Mental Reflexes," in the *Lancet*, Dr. J. Mortimer Granville observes—

A frequent cause of failure in the faculty of attention is striving to think of more than one thing at a time. It is, of course, impossible that the mind should be engaged with two topics at once. The expertness which seems to accomplish this feat is, in fact, a highly developed power of glancing from one subject to another with great rapidity—a sort of mental trapeze-flying, wherein the performer often gets an ugly fall, and may be permanently disabled. If he escape this calamity, there will probably come a time when he will discover that he has so impaired the power of application that he can scarcely follow a long sentence or carry out a sustained process of reasoning. Those who are compelled by their daily avocations to practice this flying method of thought should, for their own sakes, make it a rule to read, if possible, aloud—in any case attentively—a chapter or two of some sufficiently engrossing work at short intervals, so as to cultivate the faculty of attention.

A New Electric Mirror.

The *British Medical Journal* states that Dr. Hedinger, of Stuttgart, has invented an apparatus for the purpose of illuminating the cavities of the body, especially those of the larynx, nose and ear. It consists of a semiglobular convex mirror, made of finely polished silver, and having a platinum wire fixed to its focus. The wire is connected with a modified Bunsen's chromic acid battery, and can be heated to white heat. In cases where it is necessary to explore the larynx and nasal cavity, a plane mirror can be fastened to the concave one by means of a copper wire, so that it can be turned in all directions. In illuminating the ear or the nose, Dr. Hedinger uses a concave mirror, which is perforated in its centre. The platinum wire is fitted a little athwart the latter, so as to allow the eye to look through the whole unimpeded. The author has tried the mirror both on himself and on several patients, and has never experienced the slightest inconvenience from the temperature of the wire.

The Sputum in Pulmonary Gangrene.

In five out of six cases of gangrene of the lungs, Dr. Kannenberg (Virchow's *Archiv*) states that he found not only the forms of fungi which Leyden and Jaffe have shown to be common in sputum (bacteria, leptothrix pulmonalis, and some spirilla), but also infusoria of the family of monads. They were present in the sputum immediately after expectoration, and were in most cases abundant, commonly imbedded in plugs of fungus, but readily recognizable by their movement. Two forms were distinguishable, monas lens and cercomonas. The former is a pale spherule, somewhat smaller than a red blood corpuscle, with a long filament often wrapped around it. The latter is somewhat larger than a lymph corpuscle, also provided with a filament, often divided dichotomously, and presenting in its hinder part a process, and commonly with a clear nucleus in its interior. At rest, both forms are very similar.

Correspondence.

FOREIGN.

Letter from Great Britain.

Ed. Med. and Surg. Reporter:—

Edinburgh.—Medical matters in Edinburgh are quiet just now. The summer schools and class teachings do not open till about the first of May. These various classes display their advertisements in the windows of all the best drug stores, in medical book stores and instrument makers' shops. Some of the special classes are taught by professors of the University Medical School—a feature no doubt appreciated by the students, who flock from every quarter to this great centre of medical instruction. On one of these advertisements, Mr. Chiene's Class in Practical Anatomy, etc., I noticed a feature that our American professors and "quiz masters" might do well in copying after, *i.e.*, "External anatomy demonstrated on the living subject." It is very certain many artists know more of external anatomy than—shall I say—the majority of doctors.

Charitable institutions of a palatial appearance are numerous in Edinburgh. Probably no other city can boast of so many. These are called "hospitals," being, however, not such institutions as we commonly understand by the word "hospitals," but more like asylums, homes, etc. The handsomest among these is Donaldson's Hospital, after James Donaldson, a printer of Edinburgh, who left £210,000 for building and endowing the institution. This palatial building is situated, like most all of the others of this class, in the new part of the city. It is said Queen Victoria wished to buy this building for her Scottish palace; and, indeed, it presents a much finer appearance than her London residence.

The "Donaldson" affords accommodation for the maintenance of 300 boys and girls, including 90 deaf and dumb of both sexes, who are likewise clothed and educated. Among the "hospitals," mention may be made of John Watson's, maintaining and educating 120 children; Stewart's, erected at a cost of £30,000, for the mainten-

ance and education of poor boys, preference given to those of the name of Stewart; and finally, Fettes' College, erected in 1870, at a cost of £150,000. This is a magnificent structure. It is conducted on the same plan as some of the great English schools, and clothes and maintains besides fifty foundations.

The drug stores, or "chemists' shops," of Edinburgh are, for the most part, quite ordinary looking. No attempt is made, even by such houses as Duncan & Flockhart's, to make their windows attractive. A few ugly looking color bottles and a host of medical class advertisements are what most of the windows hold. The retail drug stores of Glasgow are much neater and more showy in front. The wholesale houses of Edinburgh are, however, as a rule, models of neatness, and throw in the shade the majority of our Market Street drug houses. Duncan & Flockhart's wholesale house looks better than his two or three retail shops. On most of the doors of the retail shops is a brass plate, stating the hours of attendance on Sundays. Glasgow has, besides its numerous "open surgeries," drug stores that display in their windows fancy and handsome signs, stating that Doctor So-and-so, of such a street, consults daily in this shop, at such and such an hour; or two to three hours morning and afternoon are given. C. C. V.

London, May 2d. * * * A suicidal death has occurred in the city this week, from two drachms of cyanide of potash, taken by a man in a glass of beer. In the statement at the post-mortem examination, Dr. Sharpe said the deceased had lived fourteen hours after taking the poison. An unaccountable length of time for a poison the effects of which are usually very rapid.

Quite a successful way some medical men and surgeons have of combating free hospital and out-door department service is seen in the following advertisement:—

"The High Street Dispensary, Woolwich. —The surgeons attend daily. This dispensary has been opened mainly for the benefit of the working classes. It is unnecessary to enlarge upon the advantages of dispensary practice as opposed to hospitalism, general, gratuitous advice, and the pernicious habit of prescribing by those unqualified to advise. Men eminent in the profession have declared themselves in favor of these dispensaries, and the classes for whom they are intended fully recognize the boon conferred by such establishments.

Advice and medicine, if necessary, 1 shilling.
" " " 2s 6d, weekly
" " " children, 1s, "
Patients attended at their homes at 3s 6d, weekly. Midwifery and vaccination attended to"

The feeling against promiscuous free prescribing is growing more strong daily. The druggist of Middlesex Hospital told me, in a late conversation, that the younger portion of the profession was making so much complaint and stir in regard to the out-dispensing of that hospital that there was much probability of this department being closed, or, at least, its working radically changed, making a trifling charge in most cases, and thus not only making it self-supporting, but aiding some of those dispensaries of a private character, as described above. The Medical and Surgical Reporter of a year or so ago contained several interesting letters on the charity subject, and it is to be hoped this universal stirring up of the subject will yield to a much-needed reform.

In regard to the hygienic condition of London, it is claimed to be the best drained, best pored and best ventilated city in Europe, or even in the world. It is drained by sewers, which run beneath the city in all directions, and empty themselves into vast main drains, by which the sewage of the metropolis and its suburbs is carried twelve miles down the river, into which it is discharged from enormous outfalls, by the aid of pumps and steam machinery. This gigantic work was begun in 1859, and is now completed.

Dr. Roberts, of Philadelphia, called attention, in one of his foreign letters, I remember, a year or so ago, to the advertisements of the great hospitals and charities all earnestly appealing for money, and in some cases stating that the work must stop unless speedy aid should come. I see all these advertisements still bear the same tone. Either their advertisements are "plots," or else they continue to have a hard time of it. See even the "Charing Cross Hospital," "The Treasurer's 'Appeal' (printed in large capitals) to the benevolent," etc.

I was surprised, in my wanderings about London, to come across a book store with its windows full of anti-vaccination tracts, selling at a penny each. Some of the titles were: "The Vaccination Horror Unveiled;" "Vaccination in the Light of History," etc. Many persons stopped at the window to nod, and not a few went in and bought a tract or two, among those being myself.

There is some prospect that a Congress of "Domestic Economy" will be held in London during this season—perhaps under the auspices of the Society of Arts. Would not such a meeting be of value in the United States. Those interested in hygiene would favor such, as well as the attempts to teach American girls cooking. Both are indirectly, if not very directly, related to health. Through their influence easy stomachs and easy minds might be obtained—both great aiders to health and happiness C. C. V.

DOMESTIC.

Female Assistants in Insane Hospitals.

Ed. Med. and Surg. Reporter:—

My attention has been called to the fact that in the report of the Committee of the State Medical Society, on women medical superintendents for the female departments of insane hospitals, a reference was made to the Philadelphia editor of the *Boston Medical and Surgical Journal*, which I have also seen in your account of the proceedings of the meeting, in the Reporter, May 31st. Knowing that it was kindly meant, I refer to it only in order to correct a possible misapprehension in the minds of your readers. I should be sorry if my signature to a protest or memorial, as a "plain M.D.," were to convey the impres-

sion to any candid mind that I was desirous of adding thereto the influence or endorsement of any journal or society with which I might be connected; nor does it justly do so, in my opinion.

Without wishing to argue the question, nor indeed having sufficient assurance to enter the lists with one of its champions, I may be permitted to briefly state several of the more prominent reasons upon which I based my opinion of this matter; reasons which I believed to be sound, and which, after carefully reading the lengthy report of the Committee, I see no cause for changing, although perfectly willing to do so as soon as it can be shown that they are erroneous.

To my mind, the present status of the question is, that certain persons desire a radical change in a plan now, and for a number of years, in successful operation. In order to gain their point, it seems to me that the burden of proof rests with them to show—

1. That the present system fails in efficiency.
2. That its defects are inherent and not remediable under existing circumstances.
3. That these defects can be obviated only by the adoption of some other system.
4. That the particular plan advocated is not only free from these defects, but also has no faults of its own sufficient to counterbalance its asserted advantages.
5. That the plan is practical, and not theoretical.

In the place of proof of the kind that is needed, we find the following assumptions, which are apparently intended to be taken as acknowledged facts:—

1. It has been an unfortunate thing that, heretofore, society has been compelled to employ medical men as superintendents of the female as well as the male wards in insane hospitals.
2. The community is unanimously of the opinion that women are best treated by female physicians.
3. The community has acknowledged that there are "grave reasons, well known to physicians, and fully realized by women," why the latter should not be attended by the former, if unfortunately of the male sex.
4. The advantages of having female medical attendance for all diseases of women, psychical as well as physical, are so manifest as to warrant the Legislature in passing a law making it obligatory upon women detained in insane asylums to have women medical attendants, while it is evident that outside of such institutions ladies only exceptionally select such advice.
5. An institution does better with two heads than one.
6. In two institutions which are quoted as having been managed by women, satisfactorily, they have performed the duties better than they possibly could have been discharged by men.
7. The favorable experience of Pennsylvania Hospital in its department for the insane, and the numerous institutions throughout the country of equally good standing in the opinion of the community, goes for nothing in the discussion of the question.
8. Women without special training are now fully qualified to do work of a character heretofore entrusted only to experts, who, according to existing rules, must have served for many years in a subordinate capacity, before they are placed in such positions of trust and responsibility.

Moreover, it should be remembered that the report was adopted at the meeting at Chester, *by only a small majority*, and it is a matter of very serious doubt whether it correctly expresses the opinion of a majority of the members of the State Society; and I would respectfully submit that we, as physicians, should hesitate to recommend legislation that is clearly opposed to the wishes and judgment of a large constituency, which, as the Committee has stated, is wanting neither in position nor influence.

I have not touched upon a number of practical questions that naturally suggest themselves, prominent among them being that of marriage, which has a very close bearing upon the practicability of the plan now urged for adoption. If women are elected for such positions during the child-bearing period, the question must come prominently before the Trustees of such institutions, whether or not the applicant for office will agree to give her whole time to her administrative duties, or expects to devote part of it to rearing children. As the appointment is for five years, and the female superintendent can be removed "only for infidelity to the trust imposed, or incompetency," it will be an important question to decide in advance.

These are some of the reasons, imperfectly expressed, for my position. I do not doubt that they must have less weight in the eyes of the advocates of the new method than they have in my own. But to me, the question is one not simply of theory; it possesses a practical application that seriously affects the future usefulness of the institutions for the insane in this commonwealth, and the condition and comfort of thousands of unfortunate insane patients; and since it is one of whose wisdom and utility a large proportion of the profession and the community honestly entertains serious doubts, it would also appear that the Legislature cannot adopt the measure in its present form at the present time, nor indeed at any time, unless some evidence is adduced that it truly represents the wisdom and the wishes of the people. If law is to be regarded as "the highest expression of reason and common sense," we should certainly hesitate before asking our lawgivers to assume the risk of stultifying themselves by the hasty passage of enactments that, in the minds of a fair proportion of the community, are held as satisfying neither of these requirements. Very respectfully,

Frank Woodbury.

218 *S. 16th St., Phila.*

Ready-made Prescriptions.

Ed. Med. and Surg. Reporter:—

Probably there is no one of the city or large town fraternity of medicine who so ardently longs for some reliable, "ready-made" form of administering medicines as the country doctor. Medicines in an accurate state of subdivision, and ready for administration, such as pills and tinctures, must furnish his main reliance, for convenience, accuracy, and purity in his remedies.

Now, sugar or gelatine coating and capsules furnish, certainly, convenience of administration. The writer, however, has personal knowledge of capsules and sugar-coated pills passing in the dejections completely intact. Cathartic remedies, when used in either of these forms, will generally prove their solubility or non-solubility in the gastric fluids. But there is no similar test, except for such remedies as emetics, antiperiodics, and narcotics, and these are not always reliable, on account of a variety of circumstances which often combine to counteract their known effects. The manufacture of gelatine and sugar-coated pills is carried on in our large cities on a very large scale, and I believe I ask a question which country physicians would like to have answered by such authorities in the cities as are reliable. It is this: "How far are these "ready-made" formulas in pills to be trusted, for reliability in administration, for accuracy, permanence of purity, and solubility in the digestive fluids? The medical journals all advertise these and a great variety of other manufactures. Is that fact to be considered in any way an endorsement of those who conduct these journals? If not, are such advertisements consistent with the code of ethics?

Danville, Ky. G. C.

[Medical editors, we are obliged to confess, are not absolutely omniscient; therefore, they do not know whether every statement made by advertisers, or correspondents either, is exactly so. They should not wittingly publish a falsehood; and with that their responsibility ends. As to the general question, some of the preparations referred to are reliable, some are not. Often those from the same manufactory differ widely. —Ed. Reporter.]

A Startling Case.

Ed. Med. and Surg. Reporter:—

Last fall I was called in to consult with a neighboring physician as to the expediency of opening what seemed to be an inguinal abscess. The history given by the attending physician was this: The tumor had been gradually forming about three weeks, first hard and inflamed, and then soft, all the time very painful. All these symptoms were elicited by interrogation, except the last. I found the surface about the tumor discolored and sensitive, partly the effect of a fly blister, which had been applied with the view of facilitating rupture of the walls of the abscess and discharge of its contents. Accepting the history as correct, and being misled by the condition consequent upon the blister, I concurred in the diagnosis, and advised opening at once.

While I held a hand of the patient, who was a delicate looking girl of about 17 years, my *frater medicus* undertook to operate. Imagine our consternation when, instead of a gush of pus as the skin was opened, there was only the sound as of air entering or escaping, and suddenly the abscess disappeared entirely, leaving no indication, except sensitiveness, of its ever having existed. What did it mean? Of course, we had mistaken a psoas for an inguinal abscess. And Dr. Gross says of spoas abscess, "As soon as it (the sac) is opened, whether spontaneously or artificially, and the air is permitted to mingle with its contents, the constitution manifests at once the most lively sympathy, as is evidenced by the rapid supervention of rigors and hectic fever, with all its train of evils."

In the present case the patient was much depressed and exhausted by the protracted severity of the pain, which no constitutional remedies seemed able to relieve. We directed our patient to be placed in a semi-recumbent posture, and warm poultices to be applied to the part. Suppuration soon commenced, and the pain which had been so unyielding soon disappeared. I saw her again the next day. She was still comparatively comfortable. Saw her again about three months after, and she was still quite comfortable, and considered convalescent. Pus continued to flow from the opening in the groin. About three months after that I heard that she was still improving, and contemplating a visit to Iron City.

Was it right to open the abscess? If I had recognized its true character, and had had in my mind the foregoing warning of Prof. Gross, I should have hesitated, at least. And yet I think it was best to open it. For the result shows that her suffering, which was exhausting her, was owing to the presence of the pus, and its liberation was followed by relief and improvement, instead of "hectic fever, with all its train of evils." But what about the air which entered the cavity of the sac? This certainly occurred, as indicated by the bubbling sound which was heard by the operator as soon as the skin was opened. After discovering our error, I examined, by touch, the skin, and found the lumbar region quite sensitive, but no curvature anywhere.

My object in reporting this case is to elicit expression of opinion as to the expediency of opening these sacs, and the danger of admitting air into them. I had little opportunity to examine as to any constitutional predisposition. Her general appearance, however, indicated a strumous diathesis. Six months after the opening she was comparatively comfortable, and apparently convalescent, without any of the grave manifestations apprehended by Profs. Gross and Erichsen. Delta.

Montgomery Co., Ind.

A Case of Stramonium Poisoning.

Ed. Med. and Surg. Reporter:—

The following case of stramonium poisoning, taken from notes in my possession, may be of interest to some of your readers. On Thursday, August 17th, 1876, my friend, Dr. Hiram Corson, very kindly asked me to see a child with him, that had been poisoned by eating the unripe pod and seeds of the stramonium. We found the child suffering very much from the effects of the poison, nearly three hours having elapsed since she took it. There was great dilatation of the pupils, with total blindness, almost constant convulsions, with great rigidity of the muscles of the spine. The child would pull and tear at its throat in the most frantic manner, so that we were com-

pelled to tie up its hands. The blowing, which is characteristic of poisoning by stramonium, was not very marked in this case, yet it did it several times in our presence. It is performed in the following manner: the child suffering from the poison suddenly throws its head back, looks up toward the ceiling, and fixing the mouth as if it were going to whistle, gives a very long expiration. It is very important to be familiar with the symptom, as it would be positive proof of the presence of this poison. In poisoning by belladonna or henbane, we would have the convulsions and dilatation of the pupils, but we would not have the blowing. In poisoning by aconite, there is great prostration, violent vomiting and loss of sensibility, but neither coma nor convulsions, while the pupils are contracted, as in opium poisoning. We immediately injected warm water into the stomach, by means of the stomach pump, until it regurgitated out of the child's mouth, when we withdrew the tube. The water was immediately vomited, bringing away a number of seeds and small pieces of the pod. We repeated this process several times or as long as we could get any seeds or small pieces of pod. I would here advise those who have occasion to use the stomach pump for the purpose of removing poisonous substances, especially if the poison is in the shape of seeds or hard substances, to first pump water into the stomach, then withdraw the tube and allow the patient to vomit up the water. This will wash out the stomach thoroughly and bring away anything that may chance to be in it. We then gave the child twelve drops of laudanum; in an hour we gave twelve drops more; two hours later we gave it fourteen drops, thirty-eight drops in all. The spasms still continued, but not so severe; two hours after the last dose the child was sleeping heavily; it was then aroused by pouring cold water on its head. The spasms had ceased and it was evidently recovering from the effects of the poison; the pupils were very little dilated. The next day the child was running about, apparently well.

News and Miscellany.

Burn Brae Private Hospital.

At a meeting of members of the medical profession of the counties of Philadelphia and Delaware, held June 5th, 1879, at the Private Hospital, "Burn Brae," Dr. R. A. Given Superintendent, of which meeting Dr. A. Nebinger, President of the Medical Society of the State of Pennsylvania, was Chairman, the following resolutions were adopted:—

Resolved, That we are most favorably impressed by the beautiful situation of the Hospital, its picturesque surroundings, elevated and healthful position, and that an examination of its interior has evidenced completness in all its departments, admirable cleanliness, neatness and comfort.

Resolved, That because of the appointments of the Hospital, the satisfactory condition of the patients, and its *home-like character*, we wish Dr. R. H. Given continued success in his humane and laudable work.

Thos. H. Andrews, M.D., *Chairman.*
Wm. H. Pancoast, M.D.
Isaac N. Kerlin, M.D., *Committee.*

Circular in Reference to the Bulletin of the Public Health, Etc.

The following extract of an Act of Congress approved June 2d, 1879, entitled "An Act to prevent the introduction of contagious or infectious diseases into the United States," has been published:—

"Section 9. So much of the Act entitled, 'An Act to prevent the introduction of contagious or infectious diseases into the United States,' approved April 29th, 1878, as requires consular officers or other representatives of the United States at foreign ports to report the sanitary condition of and the departure of vessels from such ports to the Supervising Surgeon General of the Marine Hospital Service; and so much of said Act as requires the Surgeon General of the Marine Hospital Service to frame rules and regulations, and to execute said Act, and to give notice to Federal and State officers of the approach of infected vessels, and furnish said officers with weekly abstracts of consular sanitary reports, and all other acts and parts of acts inconsistent with the provisions of this Act, be, and the same are hereby, repealed."

Alleged Blindness from Sewer Gas.

A curious case is reported from New York city. A suit was brought by a Mr. Earl against a picture dealer, named Scott, to recover $100 for one month's rent of a store. Mr. Scott vacated the store early in May, and claimed that he was justified in breaking his contract with the landlord on account of defective sanitary arrangements. Dr. Moore, of the N. Y. Eye Infirmary, testified that Mr. Scott had become blind in one eye, from the effects of sewer gas poisoning, in a place which he formerly occupied, and that he had inspected the store on Sixth avenue, and having found sewer gas escaping into it, advised his patient to remove.

A Reminder for Some Subscribers.

At the request of a certain number of subscribers, we agreed to await their convenience for a few months in remitting subscriptions. As half the year has now about expired, we trust that these friends will aid us by the prompt payment of the small sum due from each. The aggregate is burdensome, and we *do not* like to dun them. We appeal to them to let this general notice be sufficient.

Personal.

—Dr. Philip Leidy, an able and well-known member of the profession of this city, has been appointed Port Physician for this port.

—Dr. Brouardel has been elected to the chair of Forensic Medicine in the Paris Faculty in place of the late Dr. Tardieu.

American Laryngological Association.

This Association held its first annual meeting in New York, on June 10th, 11th and 12th, at Delmonico's rooms, under very favorable auspices, Dr. Louis Elsberg, of New York, in the chair. A number of valuable papers were read and discussed every day, and considerable genuine interest evinced in the entire proceedings. The St. Louis *Medical Journal* was adopted as the official organ of the Association, in the columns of which the *Transactions* will duly appear.

The officers of the Association were reëlected for another year, and New York selected as the place of meeting, which occurs on June 10th and 11th, 1880.

The Association numbers some thirty-five members. Admission to its fellowship requires the presentation of an original paper and the endorsement of its Council.

Items.

—Sir Alexander Taylor, who since 1838 had resided as English physician at Pau, is dead. He was knighted in 1865, at the instance of Napoleon III, for the great improvements he effected in the popular watering-place.

—The German Sanitary Association will meet in Stuttgart, September 15th–17th. The subjects to be discussed are—rules for disinfection; for preventing epidemics; hygiene of restaurants and lodging houses; necessity of mortuary houses; public baths.

—The consumption of beer in Paris has assumed such large proportions that its home manufacture is quite insufficient, and has to be supplied by foreign beers, which are incontestably superior. The total annual consumption exceeds 100 million litres.

—At a meeting of the McDowell Medical Society, held in Owensboro, Ky., May 28th, 29th, the following officers were elected for ensuing year: *President*, Dr. S. S. Watkins, Owensboro; *first Vice President*, Dr. W. M. Fuqua, Hopkinsville; *Recording Secretary*, Dr. B. H. Chapman, Uniontown; *Corresponding Secretary*, Dr. J. T. Sinkins, Waverly; *Treasurer*, Dr. Jas. K. Letcher, Henderson.

—The city of Memphis has gone to work in earnest in sanitary matters. An organization has been formed to clean and disinfect the streets, yards and houses in a thorough manner. Drs. R. W. Mitchell, J. Pitman, R. L. Laski, and others, lent efficient aid to the movement. Of course, there was the usual display of obstruction on the part of some of the members of the profession, but it was voted down.

—Dr. Snow reports, from Providence, R. I., scarlatina is prevalent at the present time, though not generally severe; diphtheria still continues, but has lost its epidemic character. The number of deaths from typhoid fever in May was unusually large and exceptional for the season. The number from apoplexy and diseases of the heart was very large, but, on the whole, the health of the city is good for the season, and the present is the healthiest season of the year in this city.

OBITUARY RESOLUTIONS.

Dr. F. F. Maury.

At a special meeting of the Medical Staff of the Jefferson Medical College Hospital, held June 6th, 1879, the President having announced the death of Dr. Francis Fontaine Maury, one of the surgeons of the Hospital, on motion, it was

Resolved, That by the death of Dr. Maury the Hospital has lost the services of a zealous and efficient surgeon, and one whose name has been identified with the establishment and prosperity of the Hospital and with its clinical teaching.

Resolved, That the Hospital Staff deeply deplore his loss and will cherish his memory.

Resolved, That the crayon portrait of Dr. Maury, the first of the Staff taken away, shall be preserved in the operating room of the Hospital.

Resolved, That a copy of these resolutions be entered upon the minutes of the Medical Staff, and that a copy be sent to the family.

QUERIES AND REPLIES.

Dr. H. T. B., of Mo. The recipe you sent is a fraud. There are no such plants as it mentions. This is one of the tricks of charlatans. The dupe has to write to the reverend impostor who has the alleged plant to sell, and thus makes his money.

Scrolls. True kumyss is made from mare's milk, it is true; but the variety prepared from cow's milk is believed to be substantially the same.

S. T. P., of La. We prefer not to discuss the theological aspects of medical questions. Such discussion is barren.

Dr. McG., of Pa. The text of Bernard & Huette's *Surgery* is entirely new, and very carefully edited by Mr. A. T. Norton, of London.

MARRIAGES.

BROWN—STEVENSON.—On May 15th, by Rev. Ross Stevenson, assisted by Rev. D. W. Moore, James M. Brown, M.D., and Mary E. Stevenson, all of McVeytown, Mifflin County, Pa.

PATTERSON—HEYLMUN.—On Wednesday, June the 4th, 1879, by the Rev. William H. Lewis, Samuel D. Patterson, M.D., and Sophia V. Heylmun, all of Philadelphia.

PERSINGER—HART.—On May 21st, at the residence of the bride's mother, Mrs. E. L. Hart, by Rev. Jesse Fulton, Dr. E. I. Persinger and Miss Ida L. Hart, both of Campte, La.

WILSON—BROWN.—On May 16th, by Rev. J. C. Barr, Walter S. Wilson, M.D., and Mary Alice, daughter of B. F. Brown, Esq., all of Cottage, Huntingdon county, Pa.

DEATHS.

EVERTON.—On the afternoon of the 12th inst., Dr. James S. Everton, of this city.

GREEN.—In Trenton, N. J., on May 29th, Thomas Henderson Green, M.D., aged seventy-one.

MAURY.—In this city, on the evening of the 4th instant, Francis Fontaine Maury, M.D., in his 39th year.

ROWE.—In New York, on Friday evening, May 23d, at the residence of her father, No. 410 West 34th street, Fannie M., only daughter of Dr. A. and Calesta H. Rowe.

TERHUNE.—In New York, on Thursday, June 5th, Julia F. Brundage, wife of Dr. G. A. Terhune.

PARIS EXPOSITION, 1878.

We take pleasure in stating that we were awarded a

SILVER MEDAL

FOR OUR EXHIBIT OF

SOLUBLE-COATED PILLS

AT THE

Universal Exposition, Paris, 1878.

This being the *only Silver Medal* (the HIGHEST RECOMPENSE awarded to Pills), is conclusive evidence as to the superior merits of our Soluble-Coated Pills, as compared with all other kinds and justifies the claims we have always made for the excellence of our manufactures.

W. H. SCHIEFFELIN & CO., New York.

LAWTON'S

ABSORBENT COTTON

FOR

HOSPITALS, DISPENSARIES, PHYSICIANS, DENTISTS, DRUGGISTS, PHOTOGRAPHERS, ETC., ETC.

The article furnished by us will be found superior to any other, on account of the facilities we possess for the manufacture, and the care taken at every step of the process.

Not only in general surgery, but especially in gynæcological practice, Absorbent Cotton has found great favor. It differs little from ordinary cotton in appearance, except in its uniformly fine quality and pure white color, freedom from all impurities — being entirely cleansed from oil, resin and all foreign matter.

The property of instantly absorbing liquids, its exquisite softness and great cheapness render it an invaluable substitute for Patent Lint, Charpie or Sponge.

We put up our Absorbent Cotton in neat and convenient packages, containing one pound, one-quarter pound, and two ounces.

A descriptive Circular will be forwarded on application. Samples containing two ounces will be sent, free of postage, on receipt of twenty cents.

PEPTONIC PILLS.

Pepsin, Pancreatin with Lacto-Phosphate of Lime and Lactic Acid.

(COPYRIGHT SECURED.)

This pill will give immediate relief in many forms of Dyspepsia and Indigestion, and will prove of permanent benefit in all cases of enfeebled digestion, produced from want of proper secretion of the Gastric Juice. By supplementing the action of the stomach, and rendering the food capable of assimilation, they enable the organ to recover its healthy tone, and thus permanent relief is afforded. One great advantage of the mode of preparation of these pills is the absence of sugar, which is present in all the ordinary Pepsin and Pancreatic compounds. In this form, the dose is much smaller, more pleasant to take, and is less apt to offend the already weak and irritable stomach. The results of their use have been so absolutely satisfactory, that we are confident further trial will secure for them the cordial approval of the Medical Profession and the favor of the general public.

Each pill contains one grain of pure PANCREATIN, which is equivalent to 10 grains of the ordinary or Saccharated usually prescribed and dispensed. Physicians will appreciate the great advantage of this mode of administration, the increased benefit to the dyspeptic being due to a full and effective dose of each, freed from unnecessary bulk, and really hurtful addition of sugar. A single pill will give immediate relief.

DIRECTIONS:—Take one pill immediately after eating or when suffering from Indigestion, Lump in the Throat or Flatulence. For children, reduce the pill to powder and give one-fourth or half, according to age.

WATERING PLACE PHYSICIANS.

With the annual hegira to the country and the watering places, to the seaside and the springs, comes also the annual flight of such of the city doctors who can gain a month's vacation. Some of them, of financial skill, know how to make these vacations pay better than the months at home. These shrewd brethren belong mainly to either of two classes, the Hotel Doctor or the Eminent Specialist.

The Hotel Doctor early informs the proprietor that he has come for "the season," and wants a good room, and sometimes the privilege of a very modest sign in the hall, or his cards on the desk. He promptly becomes intimate with the distinguished looking head clerk, and they occasionally may be seen in social chat over the gay cigar or the agreeable cobbler. Whether it is the natural result of friendship, or, as some wicked people whisper, of "little divvies," who can say, but certain it is, when the baby gets the stomach ache, or the stout old lady one of her bilious turns, the head clerk is remarkably apt to mention that "We happen to have an excellent physician stopping with us just now, Dr. So-and-So. Perhaps you would like to see him?" And soon the Hotel Doctor captures the family, and establishes both reputation and connections for the future.

The Eminent Specialist regards with distrust the Hotel Doctor, and gives thanks that he is not such a man. He casually mentions among his patients, for some months before his departure, that this year he will enjoy his ease at Long Branch, Saratoga, or Newport, as the case may be. Perhaps, much to his displeasure, the announcement of this fact appears in one or two of the local papers. His arrival is promptly heralded, of course without his knowledge, in the list of guests; and as various of his patients have already preceded him and are scattered at the different hotels, he not only carries his practice with him, but, through the gossip of the idle summer hours, his presence becomes more and more known, and his hands continue delightfully full.

Meanwhile, the local doctors, who have struggled through the long months of frightful dullness which are so characteristic of watering places between seasons, in hopes of some crumbs from the rich men's feast, continue to hunger, dissatisfied and disgusted. Between the two species we have mentioned, hardly a tithe of the harvest falls to their share. Justly, therefore, they complain, and the unbiased mind cannot but sympathize with them. Even if called in *pro forma* to meet the Eminent Specialist, that great man puts them in such a corner that it makes the scarce dollars come all the harder. As for the Hotel Doctor, he makes no secret among his patients of his opinion of these unfortunate country physicians. They are worthy

men, Madam, excellent men, but then, in their isolated position, you know, so much behind the times. To be sure, they can't help it, but the more the pity for their patients. If a consultation is needed, he suggests at once the Eminent Specialist, and not the local practitioner.

Deeply and bitterly cognizant of these arts, the practitioners of Saratoga Springs have entered various protests against such action of their city brethren. In a meeting of the Saratoga County Medical Society, June 31st, the following resolution was passed:—

"WHEREAS, There are certain members of the medical profession now in good standing in the State Medical Society, as well as in county societies, who annually visit Saratoga Springs for the purpose of practicing medicine, and by their questionable manners in seeking practice, to the detriment of local resident physicians; therefore, be it

"*Resolved*, That we, as members of the County Medical Society, do condemn the practice above mentioned, as contrary to the spirit of our code of ethics.

"*Resolved*, That a copy of the foregoing preamble and resolution be sent to the MEDICAL AND SURGICAL REPORTER, of Philadelphia, and the *Medical Record*, of New York, and that a copy be sent to Dr. T. B. Reynolds, delegate to the American Medical Association, with the request that he will see that it is brought to the notice of the society above mentioned.

"C. C. BEDELL, M.D., *Secretary*."

It was forcibly put by the members, in discussing the question, that such peripatetic Esculapii are not very broadly different from the itinerant medicus whom all orthodox societies hold in horror and aim to check by legislative restrictions. Such, too, has become the opinion of the French rulers, for several determined efforts have been made in that country, of recent years, to check the influx of practicing English and German doctors at the health resorts during the season.

For our own part, we always admired the plan adopted by Sir Henry Holland, as related in his autobiography. In his numerous travels and visits to places of popular resort, he declined paying professional visits except in emergencies; and not unfrequently, in order to avoid being called upon, did not register himself as a medical man at all, but as a private gentleman.

A FULL INDEX

Is a feature so essential to the usefulness of periodical literature that we make no excuse for devoting nearly the whole of this number to an Index of the volume now closing. To obtain the proper use of the Index, the volume should be bound, as searching among a pile of loose numbers is extremely inconvenient. To facilitate the work of binding we have prepared a number of cases, neatly covered with cloth and stamped with the title, in gilt, of the REPORTER, which we mail for twenty-five cents each, or five for a dollar. For a nominal sum, a few cents per volume, any binder will slip into these and fasten the numbers of each half yearly series.

NOTES AND COMMENTS.

Method of Removing Hairs.

A writer in the Michigan *Medical News* gives the following method of eradicating superfluous hairs, as practiced by Dr. C. E. Mitchell, of St. Louis. The instruments required are, a pair of good ordinary forceps to seize the hair with, then a sharp needle, fastened to a small handle (a small, sharp pegging awl will do), which is to be passed down parallel to the hair, within its sheath, till you reach the bottom of the follicle, then withdraw; melt some nitrate of silver in an ordinary spoon, and into this fluid hold the point of a small needle (similarly fixed as the puncturing needle), till the silver crystallizes around the point like a minute ball, then insinuate this miniature caustic point into the pervious puncture, cauterize the follicle of the hair bulb or root, remove all instruments, and in a few hours the hair will ulcerate out by the roots, causing no pain or lesion, with an entire removal of hairs, avoiding all possibilities of scrubby, dwarfish returning hairs.

Prevention of Contagious Diseases in Schools.

One of the British Medical Officers of Health, Mr. F. E. Mauby, suggests that if a medical certificate that each child was in good health, and had not been exposed to any known zymotic influence during the holidays, could be required at both public and private schools at the commencement of each term, and if a systematic inquiry could be made, say at the beginning of each week, in each school, as to causes of absence, a very great step would be taken toward the checking of zymotic diseases, since it is certain that

the gathering together of children at schools is the principal means of spreading these among the population.

Carbolic Acid in Malarial Disease.

A strong plea for the value of carbolic acid in malarial disease is published in the *Virginia Medical Monthly*, from the pen of Dr. A. G. Tebault. He says: As a prophylactic, carbolic acid given in grain doses, at intervals of three to six hours, has, in my hands, yielded comparatively far happier results, even in cases where unmistakable prodromes of malarial fever were actually present. In experiments instituted during the past seven years, on my own person and others, feelings of lassitude, malaise, cutaneous torpors, disturbed sleep, furred tongue, nauseous taste and anorexia, often gave way under this treatment within twenty-four hours; and a pulse hitherto jerking and irritable became calm and of the natural rhythm, while a soothingly pleasant sensation pervaded the system. No fever manifested itself in any of the cases; on the contrary, the person felt refreshed and buoyant.

No other agent which I have employed has ever superseded carbolic acid as an apparent disinfector of the malarious taint within the system; and this, after anxious thought on the subject for years, is to my mind the first glimmer of light that may lead to the discovery of means to act directly on the poison of fever.

Posture in the Expulsion of the Placenta.

Dr. A. T. A. King, in an article in the *National Medical Review*, is inclined to believe that if a woman sits up immediately after the delivery of the child, the placenta is much less apt to be retained. He states that he has repeatedly secured the delivery of the placenta by instructing the female to sit after delivery, the child having been previously separated in the usual way. He does not, however, positively recommend this practice, though he points out that if the womb were not well contracted, its contraction would be promoted in the manner stated, and what is more, should hemorrhage occur in the sitting posture, it would probably be less profuse and less frequently fatal than when the woman was recumbent, for the reason that syncope would occur sooner, and thus the force of the cardiac ventricle would be reduced earlier and before time had been allowed for it to pump out the horrible sluices of blood that so often occur during post-partal hemorrhage in the recumbent posture.

Filtration of Rivers.

Some time since the French minister of Public Instruction authorized M. Gerardin to undertake some researches with a view of suggesting a remedy for river pollution in France. The results of his experiments, which have extended over a large number of years, have lately been published. Downward filtration is, he thinks, the only system yet known which is successful in thoroughly purifying sewage water, and in rendering it fit to flow into our rivers and brooks. In the case of the Croult, a river which flows into the Seine at St. Denis, serious pollution had arisen from starch works and sugar factories on its banks; in 1874 the proprietors of some starch works at Bourget arranged to make the water from their works flow over a piece of land drained for five hundred metres, but the ground was infected, and the water retained its injurious properties. Next year the water was diverted over a piece of land twenty times as large, and the success was complete. The water is distributed in gutters, by very fine streams, so as to be spread over the whole of the ground, by which means a sufficient oxidation is secured.

Correspondence.

Ovariotomy.

Ed. Med. and Surg. Reporter:—

On the 20th of May, with the aid of my son, Dr. Wm. C. Bennett, I performed my eighth operation for ovariotomy. The patient was about thirty-five years old; married, but had never had children. It proved to be a dermoid cyst, about the size of a large cocoanut, and contained a cyst containing about two quarts of fluid, with a great number of small cysts. In the large cyst was the fragments of an upper jaw, containing four teeth, two incisors and two molars, also a cyst about the size of a hen's egg, surrounded by a thin lamina of bone, containing a large tuft of brown hair, about the length of a finger. It was not loose, but grew from the inside of the sac. She had been married five years, and about two years since thought herself pregnant, as her menses ceased for a few periods and then returned, and continued until the operation. I look upon this as a real conception, where, for some reason, the ovum was delayed in the fallopian tube, and made an ineffectual effort to mature there. The pedicle was broad, and was secured by several ligatures, which were left hanging from the lower angle of the wound. No antiseptic measures were adopted, and up to this time, five full days, not one unfavorable symptom has occurred, and there is every prospect of a favorable recovery. E. P. Bennett, M.D.

Danbury, Ct., May 26th, 1879.

News and Miscellany.

Examination of Seamen.

The Marine Hospital Service has announced, in a circular, that in order to insure to such owners of American vessels as desire the services of sound and healthy seamen facilities for the proper physical examination of crews, at all ports where medical officers of the Marine Hospital Service are stationed, such officers will, upon the application of any U. S. Shipping Commissioner, or of the master or owner of any vessel engaged in the foreign trade, or passenger steamer engaged in the coasting trade, examine physically any seaman or seamen, and give a certificate as to their fitness or otherwise. No fee will be charged for the examination.

Items.

—The Burlington County Medical Society celebrated its semi-centennial anniversary in Burlington on June 18th. Dr. Joseph Parrish read a valuable sketch of the Society for fifty years back. A number of physicians were present.

—Dr. Swan M. Burnett, of Washington, has recently made some examinations to ascertain whether the negro of the United States is affected with color blindness to the same degree as the white race. He concluded that they are less liable to the defect.

—Dr. Jollinet, a physician of the department of the Seine et Oise, France, has met with a number of cases of trichinosis. Many persons suffered from serious symptoms after eating pork from the same animal. Out of twenty who partook of this food, sixteen were attacked. A portion of the pork was examined microscopically by M. Laboulbène, who had been consulted by Dr. Jollinet, and a number of trichinæ were found in it. The pork itself did not present any unusual appearance, not even when examined by a lens. This is the first epidemic trichinosis which has been observed in France.

OBITUARY NOTICES.

John T. Darby, M. D.,

Professor of Surgery in the Medical Department of the University of the city of New York, died last week, at the age of 42 years. His death was traceable to the introduction of septic matter into the system at an operation performed two years ago. Although the poison did not prove immediately fatal, his health has been gradually giving way ever since, and no medicine availed to eliminate the poison. Dr. Darby was a native of South Carolina, and a graduate of the Medical Department of the University of Pennsylvania. In September, 1873, he was offered and accepted the chair of Surgical Anatomy in the University of the City of New York. In May, 1874, he was offered and accepted the chair of Surgery, so long and so ably filled by the late Valentine Mott. Dr. Darby was also Visiting Surgeon to Mount Sinai and Bellevue Hospitals, a member of the Philadelphia Academy of Sciences, permanent member of the American Medical Association, and member of the Neurological Society, to which he contributed his paper on the "Trephine in Traumatic Epilepsy." He was the author of a thesis on the "Anatomy, Physiology and Pathology of the Supra-renal Capsules." His "Campaign Notes on the German War" is a standard work on military surgery. He also wrote papers on liquid glass as a surgical dressing, and horse-hair as a ligature and suture, besides various military and civil reports, notes on original operations, and contributions to medical periodicals.

—Died, suddenly, at his home, in Steubenville, O., on the evening of June 18th, 1879, Dr. Thomas Johnson, in the sixty-ninth year of his age. Dr. Johnson received his academic degree from Jefferson College, Cannonsburg, Pa., in 1828, and his degree in medicine from Jefferson Medical College, Philadelphia, in 1832. He was a good physician, a wise counselor, and a Christian gentleman.

—Dr. D. W. Putnam, the oldest practicing physician of Lamoille county, Vt., died at his residence in Morrisville, Vt., June 16. He was a graduate of the Medical Department of the U. V. M., in the class of 1828.

—Dr. Jacob F. Treichler died at McKeansburg, Schuylkill county, Pa., on June 18. He was one of the leading citizens of the county, having gone there in 1830, from Bucks county.

—Dr. Peregrine Wroth, who practiced medicine in Chestertown for over fifty years, died in Baltimore the other day.

MARRIAGES.

HEGEMAN—MOYER.—In Trenton, N. J., June 5th, at the residence of the bride's brother, by the Rev. Wm. H. Neilson, Jr., Dr. J. Aycrigg Hegeman, of New York City, and Lizzie C., daughter of the late Charles Moyer, of Philadelphia.

NEILL—MACALASTER.—In Philadelphia, in the Second Presbyterian church, June 4th, by Rev. Tryon Edwards, D.D., Dr. Hollingsworth Neill and Julia Kissam, daughter of the late Charles Macalester, Jr.

DEATHS.

DARBY.—In New York, on Monday, June 9th, 1879, at No. 39 West 20th street, John Thomson Darby, M.D., in the forty-third year of his age.

GRINDLE.—In Camden, N. J., on June 12th, Wesley Grindle, M.D., late of this city.

HORTON.—On June 11th, of pulmonary phthisis, Maggie, wife of Dr. L. S. Horton, No. 32 West 17th St., New York.

INGRAM.—In this city, on the 12th inst., Thomas Ingram, M.D., aged seventy-one years.

OSGOOD.—On Tuesday, June 3d, at No. 237 East 17th street, Caroline P. Osgood, daughter of Dr. J. W. D. Osgood, of New York.

PHELPS.—In North Attleboro, Mass., on June 2d, Dr. Thaddeus Phelps, a native of Windsor, Vt.

RIDGELY.—In this city, on the 10th inst., Thomas Howard Ridgely, M.D., late Surgeon U. S. Army.

WARDER.—In Germantown, on the 12th instant, Jane H., daughter of Dr. John W. and Elizabeth B. Warder, of Cincinnati, Ohio.

McKESSON & ROBBINS' GELATINE-COATED

PILLS AND GRANULES.

(PROCESS AND MACHINERY PATENTED.)

OVAL IN FORM, RELIABLE, SOLUBLE.

Samples of our Pills furnished any Physician upon application.

CATHARTICS and LAXATIVES.

Aloes, 4 grs.
Aloes and Myrrh.
Aloin, 1 gr.
Calomel, 1-2, 1, 2, 3 and 5 grs.
Cathartic Compound, U. S.
Cathartic, Improved.
Cathartic, Vegetable.
Cook's.
Croton Oil, 1-2 gr.
Dinner, Cole's.
Dinner, Lady Webster's.
Hooper's, 2 1-2 grs.
Laxative, Cole's.
Podophyllin, 1-8, 1-4, 1-2 and 1 gr.
Podophyllin and Blue.
Podophyllin and Leptandrin.
Podophyllin, Capsicum and Belladonna.
Podophyllin Compound.
Podophyllin, Ext. Colocynth and Belladonna.
Poke Root Compound.
Rhubarb, U. S.
Rhubarb Compound, U. S.
Rhubarb Compound and Calomel.

GRANULES.

Aconitia, 1-60 gr.
Arsenious Acid, 1-50, 1-40, 1-30 and 1-20 gr.
Atropia, 1-60 gr.
Belladonna Extract, 1-4 gr.
Calcium, Sulphide, 1-10 gr.
Codeia, 1-16 and 1-5 gr.
Corros. Sublimate, 1-100, 1-40, 1-30 & 1-20 gr.
Digitalia, 1-60 gr.
Hydrastia, 1-2 gr.
Mercury, Bin-Iodide, 1-25 and 1-16 gr.
Mercury, Cyanide, 1-20 gr.
Mercury, Proto-Iodide, 1-5, 1-4 and 1-2 gr.
Morphia, Acetate, 1-8 and 1-4 gr.
Morphia, Muriate, 1-8 gr.
Morphia, Sulphate, 1-16, 1-10, 1-8, 1-6, 1-4 gr.
Morphia, Valerianate, 1-8 gr.
Podophyllin, 1-8 and 1-4 gr.
Quinine, 1-4 and 1-2 gr.
Strychnia, 1-100, 1-60, 1-40 and 1-30 gr.
Sulphur, Iodide, 1-25 and 1-10 gr.
Tartar Emetic, 1-100, 1-20 and 1-4 gr.
Zinc, Phosphide, 1-6, 1-4 and 1-2 gr.

VARIOUS FORMULAS.

Ammonium, Valerianate. 1 gr.
A convenient form of administration.
Assafœtida, 2 and 4 grs.
Assafœtida and Nux Vomica.
Made of purified Assafœtida.
Caffeia, Citrate, 1 gr.
Remedy and preventive in sick headache.
Calcium, Sulphide, 1-10 gr.
Scrofulous sores, &c.
Camphor, Mono-Bromated, 2 and 3 grs.
Hysteria, headache, nymphomania.
Cannabis Indica Extract. 1-2 and 1 gr.
Rheumatism, hysteria, delirium tremens.
Cerium, Oxalate, 1 and 2 grs.
Vomiting in pregnancy.
Coca Extract. 1 gr.
Tonic and stimulant.
Copaiba and Oleo-Resin Cubeb, 3 and 5 grs.
Of pure materials; can be relied upon.
Ergotin, 3 grs.
Made of purified Ergotin.
Fucus Vesiculosus Extract, 3 grs.
To decrease excessive obesity.
Grindelia Robusta Extract, 3 grs.
Hay fever, asthmatic affections.
Guarana Extract, 3 grs.
Headache, neuralgia.
Hypophosphites Compound.
A convenient form of administration.
Iodide of Iron (Blancard's), 1 gr.
Freshly prepared; superior to the imported.
Iron, Dialysed, 2 grs.
Made of Merck's scales.
Jaborandi Extract. 3 grs.
Diaphoretic and sialogogue.
Lithium, Bromide, 2 grs.
A better hypnotic than Brom. Pot.
Phosphates Iron, Quinine and Strychnine.
A tonic more convenient than the syrup.
Phosphorus, 1-100, 1-50, 1-30, 1-20, 1-12 gr
And over 20 combinations.
Salicin, 2 1-2 and 5 grs.
Useful in rheumatism.
Salicylic Acid, 2 1-2 and 5 grs.
Salicylic Acid and Morphine.
Valuable in rheumatism.
Sandal Wood Extract, 1 and 2 grs.
Contains both the oil and resin.
Sumbul Extract, 1 gr
Hysteria, spasmodic disorders.
Zinc, Phosphide, 1-6, 1-4 and 1-2 gr.
Zinc, Phosphide and Extract Nux Vomica.
Brain diseases.

Our Formula Book, (fourth edition) containing complete list of all our pills with formulas and therapeutical notes, together with partial list of our fluid extracts, with doses, furnished upon application. As we desire to *improve* in *every* particular, we will be grateful to any Physician who will write us regarding his experience with our Gelatine-Coated Pills and other preparations, or make any suggestions.

McKESSON & ROBBINS, Manufacturing Chemists,

91 Fulton Street, New York.

CAUTION!!—SPECIFY McKESSON & ROBBINS'

☞ SUPERIOR TO PEPSIN OF THE HOG.

INGLUVIN

FROM THE

Ventriculus Callosus Gallinaceus.

A specific for VOMITING IN PREGNANCY, a potent and reliable remedy for the cure of INDIGESTION, DYSPEPSIA, and SICK STOMACH, caused from debility of that organ. It is superior to the Pepsin Preparations, since it acts with more certainty, and effects cures where they fail.

"A New Remedy, INGLUVIN."

By A. F. SHELLY, M.D., of Philadelphia.

"This is obtained from the gizzard of the domestic fowl (chicken), and is a *Specific for Vomiting in Pregnancy.* I have used this remedy for twenty-five years, and it has never failed. It is also the most *powerful* and *reliable remedy* for the *Cure* of *Indigestion, Dyspepsia,* and *Sick Stomach,* caused from debility of that organ. It is useful in all cases where pepsines and pancreatines are used, but with much more certainty of good results.

"In complicated affections of the Stomach, such as *Inflammation, Gastralgia, Pyrosis,* etc., it may be combined with Subnitrate of Bismuth and opiates; and in Diarrhœa and Cholera Infantum, with astringents, both vegetable and mineral. I have given the article to several prominent physicians, who have used it with the happiest results, among whom I may mention Prof. E. WALLACE, of the Jefferson Medical College."

AN EFFICIENT REMEDY AND AN AGREEABLE SUBSTITUTE FOR COD LIVER OIL.

PROF. TROUSSEAU'S

CARBONIZED

FRESH MEAT CURE.

Consisting of TENDER, RAW, LEAN BEEF, desiccated in vacuum, combined with CARBON as an antiseptic, and medicated with HYPOPHOSPHITES OF LIME, SODA, and POTASSA with CINCHONA. A medicated, nourishing food, pleasant to take and easily digested, for the cure of

Consumption, Chronic Dysentery, and Exhausted Conditions consequent upon Typhus and Typhoid Fevers, Typhoid Pneumonia, Diphtheria, General Debility, Nervousness, and Prostration from whatever cause.

In presenting this to the Medical Practitioners of the United States, we scarcely deem it necessary to extol a remedy the efficacy of which they must determine by actual trial. We believe, as Pharmaceutical Chemists, that we have overcome a difficulty by making this preparation of fresh meat stable under all circumstances; while, at the same time, it is potent, efficacious, and palatable.

WILLIAM R. WARNER & CO.,

1228 MARKET STREET, PHILADELPHIA,

MANUFACTURERS OF SUGAR-COATED PILLS.

RELIABLE

ANIMAL VACCINE.

The undersigned respectfully announces that he has discontinued the practice of furnishing Vaccine *at his residence.*

Physicians can obtain the ***Animal Vaccine*** of MESSRS. CASWELL, HAZARD & CO., BROADWAY, CORNER 24TH STREET.

FRANK P. FOSTER, M.D.

By our arrangement with Dr. Foster, *all* Vaccine supplied by *us* is *absolutely fresh.*
We can furnish it in any quantity desired, either by express or by mail, if remittance is made to cover postage.
Dr. Foster's Animal Vaccine is the only kind that may be said to have the unqualified endorsement of the Medical Profession of New York.

QUILL SLIPS (half quill, charged on convex surface, at square-cut end).....25 cts.
CAPILLARY TUBES.....$2 00

For ordinary use *Quill Slips* are the most reliable of all forms of stored Vaccine, and in cases of failure with them in *primary* vaccination, if used within one week of their issue, and strictly in accordance with the printed directions, *being in the meantime kept cool and dry*, a second supply will be furnished gratis.
Tubes are intended chiefly for transportation to long distances, as the virus is preserved for a considerable length of time. They are superior to crusts, but inferior to quill slips.
Crusts are not recommended, and are not sold, for the reason that, however fresh, and however well formed they may be, they are apt to prove inefficient.

CASWELL, HAZARD & CO., New York.

APOLLINARIS

NATURAL MINERAL WATER.

HIGHLY EFFERVESCENT.

Approved by the Academy of Medicine of France, and its sale in France authorized by special decree of the French Government.

"THE QUEEN OF TABLE WATERS."—*London Medical Record.*

PROFESSOR OSCAR LIEBREICH, Professor of Medical Chemistry, University of Berlin:—"After minute personal investigation, I can affirm that the Apollinaris Water is bottled according to all the rules of science, and is an entirely Natural Mineral Water."

PROFESSOR J. A. WANKLYN, Lecturer on Chemistry, St. George's Hospital, London:—"I have thoroughly examined the Apollinaris Spring and the method of bottling. The Apollinaris Water, as supplied to the public, is simply and purely a Natural Mineral water, impregnated only with its own gas."

PROFESSOR MOHR, Medical Councillor, University of Bonn:—"After exhaustive investigation, I declare the Apollinaris Water, as supplied to the public, to be purely natural in every respect, and of most excellent quality."

DR. THEODOR KYLL, Analytical Chemist, Town Councillor, Cologne (*expert appointed by United States Vice-Consul, October*, 1877), reported that "The Apollinaris Water, as bottled, deserves in every respect the name of an excellent natural acidulated water."

Every Genuine Bottle bears the REGISTERED YELLOW PICTORIAL LABEL of the Apollinaris Company, Limited, London.

To be had of all Wine Merchants, Grocers, Druggists, and Mineral Water Dealers throughout the United States, and Wholesale of

FREDK. DE BARY & CO., Sole Agents,

1117-1168 **41 and 43 WARREN STREET, NEW YORK.**

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION,

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil, by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM, instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat, in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion may therefore be regarded as Chyle obtained by nature's own process. In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more stable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatized Cod-Liver Oil, the active digestive principle of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Pancreatine effects the digestion and assimilation of Cod-Liver Oil and Fat, as well as Food generally. This palatable and popular remedy is therefore invaluable to PATIENTS WHO ARE UNABLE TO DIGEST COD-LIVER OIL, and who are thus deprived of its nourishing and invigorating properties.

Pancreatine Wine. An excellent vehicle for taking Cod-Liver Oil and promoting the digestion of it.

Tins, 1*s*, 2*s*, 5*s*, 10*s*.

AS SUPPLIED TO

THE ROYAL NURSERIES

Of England, Russia, Etc.,

AND CONTAINING THE

HIGHEST AMOUNT OF NOURISHMENT

IN THE

MOST DIGESTIBLE AND CONVENIENT FORM.

THE MOST PERFECT SUBSTITUTE FOR HEALTHY MOTHER'S MILK.

DATURA TATULA FOR ASTHMA, Etc.

A powerful and universally adopted Remedy

"By immediate contact with the air cells and passages, instant relief is given."—Dr. LATHAM, *Physician to the Queen*.

"A remedy of great power and usefulness in Asthma, Chronic Bronchitis, etc."—Dr. W. BARKER.

"The Smoke causes no nausea. I have never known an instance in which relief was not obtained." GENERAL ALEXANDER.

In Tins, for use by means of a pipe, Cigars and Cigarettes, and Pastilles, for Inhalation.

SAVORY & MOORE, 143 New Bond Street, London.

Agents for America, E. FOUGERA & CO., NEW YORK.

TO THE MEDICAL PROFESSION.

LACTOPEPTINE,

The most important remedial agent ever presented to the Profession for Indigestion, Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all diseases arising from Imperfect Nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase, or Veg. Ptyalin, Lactic and Hydrochloric Acids, in Combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk.....40 ounces.	Veg. Ptyalin or Diastase.....4 drachms.
Pepsin..... 8 ounces.	Lactic Acid.....5 fl. drachms.
Pancreatine ..... 6 ounces.	Hydrochloric Acid.....5 fl. drachms.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its almost universal adoption by the Profession is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned having tested LACTOPEPTINE, recommend it to the Profession:—

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine, University of the City of New York.

LEWIS A. SAYRE, M.D.,
Professor of Orthopædic Surgery and Clinical Surgery, Bellevue Hospital Medical College.

F. LE ROY SATTERLEE, M.D., PH.D.,
Professor of Chem., Mat. Med. and Therap. in the N. Y. College of Dent.; Prof. of Chem. and Hygiene in the Am. Vet. College, etc., etc.

SAMUEL R. PERCY, M.D.,
Professor Materia Medica, New York Medical College.

A. VAN DEVEER, M.D.,
ALBANY, N. Y., June 8th, 1878.
Prof. of the Prin. and Prac. of Surg., Albany Med. Col.; Surg. Albany and St. Peter's Hospitals.
"I have given LACTOPEPTINE a good thorough trial, and have been greatly pleased with the excellent results that have followed its administration."

JOHN H. PACKARD, M.D.,
PHILADELPHIA, PA., May 30th, 1878.
Pres't Phila. Co. Obstet. Society; Surg. Episcopal and Women's Hospitals.
"I have found great satisfaction in the use of LACTOPEPTINE, and have ordered it frequently in cases of Dyspepsia, especially where there is want of tone and defective secretion."

JAS. AITKEN MEIGS, M.D.,
PHILADELPHIA, June 20th, 1878.
Prof. of the Institutes of Med. and Med. Juris., Jeff. Medical College; Phy. to Penn. Hos.
"I have used LACTOPEPTINE with very good effect in a number of cases of Dyspepsia."

W. W. DAWSON, M.D.,
CINCINNATI, O., June 21st, 1878.
Prof. Prin. and Prac. Surg., Med. Col. of Ohio; Surg. to Good Samaritan Hospital.
"I have used LACTOPEPTINE with great advantage in cases of feeble digestion."

ALBERT F. A. KING, M.D.,
WASHINGTON, D. C., June 19th, 1878.
Prof. of Obstetrics, University of Vermont.
"I have used LACTOPEPTINE both in hospital and private practice, and have found it to answer fully the purposes for which it is recommended. As an immediate aid to the digestive function, I know of no remedy which acts more directly."

D. W. YANDELL, M.D.,
LOUISVILLE, KY., March 7th, 1878.
Prof. of the Science and Art of Surg. and Clinical Surg., University of Louisville.
"I have made much use of LACTOPEPTINE, and take great pleasure in stating that it has rarely disappointed me. I shall, of course, continue to prescribe it."

ROBT. BATTEY, M.D.,
ROME, GA., June 8th, 1878.
Emeritus Prof. of Obstetrics, Atlanta Med. College, and Ex-Pres. Med. Association of Ga.
"I have used LACTOPEPTINE in a case of Dyspepsia with satisfaction. I think well of it."

CLAUDE H. MASTIN, M.D., LL.D.,
MOBILE, ALA., June 8th, 1878.
"I consider LACTOPEPTINE the very best preparation of the kind which I have ever employed, and for patients with feeble digestion I know of nothing that is equal to it."

Prof. H. C. BARTLETT, PH.D., F.C.S.,
LONDON, ENG., February 22d, 1876.
"I find the preparation of LACTOPEPTINE contains within itself all the principles required to promote a healthy digestion.

PRICE LIST.

LACTOPEPTINE (in oz. bottles).....per oz.	$1.00
" (" ").....per doz.	10.00
" (in ½ lb ").....per lb.	12.00

We also prepare the various Elixirs and Syrups, in combination with Lactopeptine.

THE NEW YORK PHARMACAL ASSOCIATION,

2 and 3 COLLEGE PLACE, NEW YORK.

SPECIAL FACTS CONCERNING

BELLADONNA PLASTER

IN RUBBER COMBINATION.

PREPARED BY

SEABURY & JOHNSON.

In undertaking the manufacture of Medicinal Plasters we had but one object in view—THE IMPROVEMENT OF ALL KINDS OF PLASTERS. Among the various plasters manufactured by us was BELLADONNA PLASTER. This article met with a larger demand than some of the others, acquired a reputation among the best druggists, and received the confidence of the profession. Its large sale interfered with rival manufacturers, and continuous efforts have been made on their part to prejudice physicians against it.

As these attacks have been of late more malicious than usual, we have deemed it advisable, in self-defence, and in order to place our article fairly before the practitioner, to assign reasons why we consider it the most thoroughly reliable preparation ever offered the medical profession. First, it is a combination of the Alcoholic Extract of Belladonna only, with purified rubber, and thus possesses all of the advantages of the rubber base, being pliable, convenient of application, and not subject to the deteriorating influence of age, as is the case when any other base is used. Secondly, it is freed from all irritative properties. Thirdly, it is more adhesive than any other plasters. Fourthly, we believe it to be as perfect in every respect as it is possible to make a Belladonna Plaster.

ENGLISH EXTRACTS—WHY WE DO NOT EMPLOY THEM.

Imported English Extracts are prepared from the Inspissated Juice of the leaf, whilst our pharmacopœia formula is treated by Alcohol. The active principle of Belladonna (Atropia) is only partially obtained by Inspissation. The employment of Alcoholic or Hydro-Alcoholic Solvents completely exhausts the entire strength of the drug.

The value of both preparations is clearly presented in an able treatise published in the *American Journal of Pharmacy*, April 1876, page 145. Our own investigations are substantially identical:—

TABLE OF RESULTS.

	Test solution requisite for 100 c. c. of Ext. Solution.	Percentage of Atropia in Extract.
EXT. BELLADONNÆ ALCOH. U. S. P.	17·732	2·571
GEO. ALLEN & CO., English	9·73	1·411
HERRINGS & CO., " ..	8·133	1·179
E. MERCK, Germany (aqueous extract), made 1869	1·9	·275

This analysis clearly establishes the fact that the **Alcoholic Extract of Belladonna of the U. S. P. averages over twice the strength of English Extracts**, and should, therefore, be preferred in all cases where a reliable article is desired. Inspissated and Aqueous Extracts deteriorate, while Alcoholic remain stable.

Therefore the assumption of pretentious manufacturers that the English Extracts are the superior preparations, must be based on a former supposition rather than present facts. The following analysis substantiates our claim regarding English Extracts.

ANALYSIS OF BELLADONNA PLASTERS, BY PROF. R. OGDEN DOREMUS.

"BELLEVUE HOSPITAL COLLEGE, New York, Sept. 7, 1878.

"GENTLEMEN—I obtained from Messrs. W. H. Schieffelin & Co., of this city, samples of Belladonna Plasters prepared by Grosvenor & Richards, Boston; Mitchell Novelty Plaster Works; Seabury & Johnson, New York and London. I have examined these varieties for the purpose of determining which possesses the largest quantity of Atropine. I employed equal surfaces of each, and *my analysis demonstrated that* SEABURY & JOHNSON'S *contains the greatest proportion* of the active principle of Belladonna.

"R. OGDEN DOREMUS, M.D., LL.D."

Belladonna Plaster, prepared by Seabury & Johnson, is packed in elegant tin cases, which contain 1 yard each, and can be obtained of almost any druggist throughout the United States and Canada, or will be furnished direct by mail. Samples sent on application.

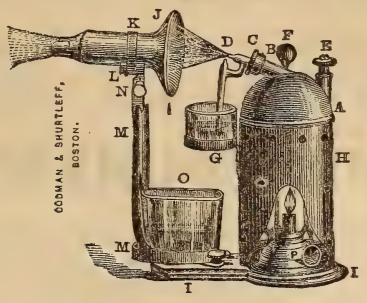
CODMAN & SHURTLEFF'S

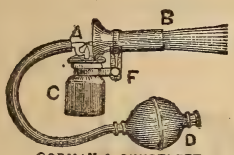
ATOMIZING APPARATUS.

PRICES REDUCED.

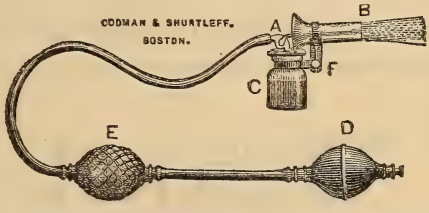


THE COMPLETE STEAM ATOMIZER. (Patented March 24, 1868.)

All its joints are hard-soldered.
Every one is tested by hydrostatic pressure, to more than one hundred pounds to the square inch.
It cannot be injured by exhaustion of water, or any attainable pressure, and will last for many years.
It does not throw spirts of hot water, is convenient, durable, portable, compact, and cheap, in the best sense of the word. Price $5.00. Postage 59c.
Brass parts, nickel-plated, additional, $2.00.
Neatly made, strong Black Walnut Box, with convenient Handle, additional, $2.50. Postage 44c.



THE BOSTON ATOMIZER. (Patented.)



SHURTLEFF'S ATOMIZING APPARATUS. (Patented.)

The most desirable Hand Apparatus. Rubber warranted of the very best quality. Valves imperishable, every one carefully fitted, and will work perfectly in all positions. Price $3.50.
The Bulbs are adapted to all the Atomizing Tubes made by us.
Each of the above Apparatus is supplied with two carefully-made annealed glass Atomizing Tubes, and accompanied with directions for use. Each Apparatus is carefully packed for transportation, and warranted perfect.

The Antiseptic Atomizer		*$15.00, $25.00, $45.00, and $50.00*
Atomizer by Compressed Air, with Regulating Self-acting Cut-off		*45.00*

13 and 15 TREMONT STREET, BOSTON.

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt. and all its combinations.

Extract of Malt,

WITH COD-LIVER OIL,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO,

(See Transactions of American Medical Association, for 1876, page 176.)

Is presented to the medical profession as an efficient, palatable and very stable combination, consisting of equal parts of the ***Extract of Canadian Barley Malt*** and the best quality of genuine ***Norwegian Cod-liver Oil.*** Many patients take this preparation who cannot take the oil in any other form. It may be employed in all cases where Cod-liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

Extract of Malt,

WITH COD-LIVER OIL AND PHOSPHORUS,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod-liver Oil, Phosphorus being added in the proportion of $\frac{1}{100}$ grain to the dose, and so combined as to be perfectly protected from oxidation. The ***Trommer Extract of Malt Company*** prepare this combination agreeably to the suggestion of ***Dr. Wilson Fox.*** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

Extract of Malt,

WITH COD-LIVER OIL AND IODIDE OF IRON

added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod-liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians, referring to it in terms of high praise.

For 100 " " ..... " 2 00

For 50 Patients weekly, 2 vols.... {Jan. to June / July to Dec.} Price, $2 50
" 100 " " " {Jan. to June / July to Dec.} " 3 00

INTERLEAVED EDITION.

For 25 Patients weekly.....Price, $1 25
For 50 " ..... " 1 50

For 50 Patients weekly, 2 vols.... {Jan. to June / July to Dec.} Price, $3 00

This is the *twenty-eighth* year of its publication. It has received the most unqualified approval of, and is in very general use by, the profession in every section of the United States and in Canada. Its compact size, convenience of arrangement, and the durability and neatness of its manufacture, have everywhere obtained for it a preference.

"Its arrangement is such as to afford all the requirements of day book, register of business, remembrancer of engagements, and common memorandum. It is really a business *vade mecum* to the professional man."—*American Medical Journal.*

"The simplest of all Visiting Lists, it must continue to hold, which it now has, the preference over all other forms of this indispensable companion for the physician."—*New York Medical Journal.*

For Sale by all Druggists and Booksellers.

MACMILLAN & CO.'S
NEW MEDICAL PUBLICATIONS.

BRAIN.

A JOURNAL OF NEUROLOGICAL SCIENCE.

Edited by Drs. BUCKNILL, CREIGHTON-BROWN, FERRIER and HUGHLINGS JACKSON.

Published Quarterly. $1.25 per number. Annual Subscription $4.00; free by mail.

A sample copy of Number One sent on receipt of Seventy-five cents.

It will be the object of "BRAIN" to keep its readers well abreast of modern progress in Neurology, and to advance the knowledge of a class of diseases respecting which it is universally admitted that much has yet to be learned.

Sent free by mail to any address, on receipt of the price.

THE JOURNAL OF PHYSIOLOGY.

Edited, with the coöperation in England of Prof. A. GAMGEE, F. R. S., Prof. W. RUTHERFORD, F. R. S., Prof. J. B. SANDERSON, F. R S., and in America of Prof. H. P. BOWDITCH, of Boston, and Prof. H. N. MARTIN, of Baltimore; By Dr. M. FOSTER, F. R. S., Trinity College, Cambridge.

Vol. I., Part I., Now Ready, $3.00.

The Subscription Price per Volume will be, when paid in advance, $5.25. Sent free by mail.

The morphologists in England and America already possess an appropriate periodical literature; but the physiologists have hitherto been without an organ devoted exclusively to the publication in the English language of the results of physiological research. The want of such a periodical has long existed, and is daily increasing.

It is with a view of meeting this want that the JOURNAL OF PHYSIOLOGY has been established; and its conductors trust that the nature of the communications of which they hope to make it the medium will be at once readily understood by all workers in Biology.

THE PRACTITIONER.

A MONTHLY JOURNAL OF THERAPEUTICS AND PUBLIC HEALTH.

Edited by T. LAUDER BRUNTON, M. D., F. R. S.

"To hard-worked medical men, with little time for reading, and few opportunities for professional conversation, such a journal as this, bringing every month the latest ideas in medical practice and latest records of important cases, ought to be invaluable."—*London Guardian.*

Sample Copies, 40 cents. Annual Subscription, $4.00.

INSANITY AND ITS PREVENTION,

Insanity in Ancient and Modern Life. With Chapters on its Prevention. By D. H. TUKE, M. D. 12mo, cloth, $1.75.

PRACTICAL CHEMISTRY FOR MEDICAL STUDENTS.

By W. M. PATTISON MUIR, F. R. S. E. 18mo, cloth, limp, 60 cents.

CLINICAL MEDICINE.

Lectures on Clinical Medicine, delivered in the Royal and Western Infirmaries of Glasgow. By Dr. MCCALL ANDERSON, Author of the "Treatment of Diseases of the Skin." With Illustrations. 8vo, cloth, $3.00.

PRESCRIPTIONS AND PRESCRIBING.

Lessons on Prescriptions and the Art of Prescribing. By W. HANDSEL GRIFFITHS, PH. D., L. R. C. P. E. Third Edition. 18mo, cloth, $1.25.

PHYSIOLOGY.

A Text-Book of Physiology. By M. FOSTER, M. A., M. D., F. R. S. Second Edition, revised. 8vo, cloth, $6.50; sheep, $7.50.

"I recommend it to my students as the latest, and in some respects the best, Physiology in the English language."—*From a Letter from Prof. Burt G. Wilder.*

Any of the above works sent free by mail on receipt of the price.

THE LATEST IMPROVEMENT

IN

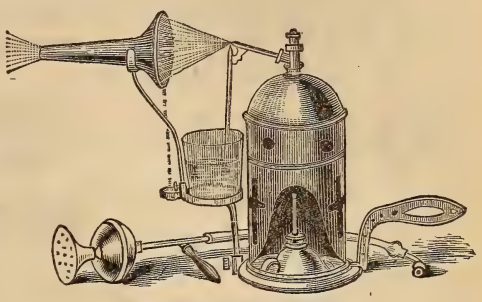
Atomizers, Croup-Bottles and Baths.

PERFECT STEAM ATOMIZER.

Price, with Handle and Glass Atomizing Tubes.....$4 50

With Glass and Metal Atomizing Tube, and Apparatus for giving fomentations to any part of the body..... 6 00

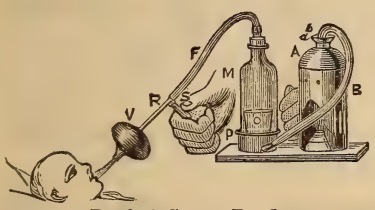
All joints are hard soldered. Every one is tested, and they cannot be injured by exhaustion of water. A perfect safety-valve, guaranteed to remain in thorough working order, and connections for steaming any part of the body locally, complete it.



Perfect Steam Atomizer.

The Apparatus for Steaming Locally.....$3 50
Antiseptic Atomizer, Nickel Plated, Throwing Spray for Two Hours.....$10 00 to 13 00
Stand, Throwing Spray in any Direction.....5 00

PERFECT CROUP BOTTLE.



Perfect Croup Bottle,
For confining and conducting lime-fumes and acid-vapors, in croup and diphtheria.

L is a tray with handle; *O* is a cup which is filled one-quarter full of lime, with sufficient water: the lime slackens as soon as it becomes hot, and the fumes escape through the nozzle. If acids are used, place them directly in cup *P*, so that the steam will pass through the fluids and evaporate them.

Price, complete, with nozzle for fomentations.....$5 00
Atomizer, with Croup-Bottle combined..... 9 00

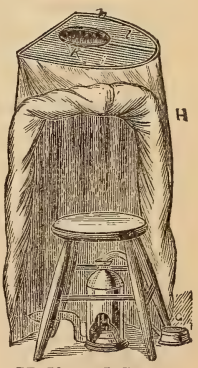
MEDICATED STEAM BATH.

The Bath consists of a large boiler, four times the size of the Atomizer, a steam distributor, and a cloak.....$6 00
If with nozzle for local applications.....extra. 2 00

With box for carrying, 12x6x6.

For Sulphur and Mercurial Baths, a lamp to burn the ingredients is supplied, and also a rubber cloak, to which is attached a rubber tubing for the purpose of conveying the fumes out of the room, making it a perfect Sulphur Bath for family use and office practice.

Price of Sulphur Bath.....$15 00
With nozzle for local applications..... 17 00



Medicated Steam Bath.

Prices.—Vaginal T, $2.00. Anal U, $1.50.

Caustic Bottle and Case. *11.*

Price, $1.50.

Hymen—Pointed. *8.*

Price, $1.50.

Vaginal and Vulva Dilator. *9.*

Price, $1.50.

STAUFFER'S NON-EVAPORATING INKSTAND.

Price, $1.00.

Price, $1.00. *15.*

13.

Supporters E. C. or Economy.—Fig 5, on its elastic belt Z, is the least in price, and by the oblique construction of the cup sets direct within the angle of the axis of the uterus and vagina, (well seen by IU. Fig. 13) If properly selected, or made so by the exchange privilege, (which admits the interchange of all the hard rubber parts in the catalogue, to cover the purchaser's risk.) It is warranted to correct and sustain even any ***Procidentia.*** The spring stems and shifting tops with their supplements, Fig. 1. Also, improved ***Retroversion, Cup E. Anterversion C.*** and ***Intra-Uterine Stem Cup, IU,*** Fig 13. The stem locks in a square socket after the cup is in position, and is supported on the elastic gums SS, as A Fig. 1, and same in price Stem Levers, Fig. 14, etc. All are fully explained in the catalogue. The ***Series*** comprises upwards of 150 in style and size instruments, of which two thirds belong to the support and correction of the uterus. ***Speculums***—Thomas' objections p. 67—76, are by them completely overcome. The case contains four. The clear and large view, and facility to work through them, far exceeds any other. The ***Ex. Case,*** and physician's favorite, is admirably represented by Fig. 12—weight but 4 oz. ***Catalogue*** sent free on application. In addition to the description of the above series of instruments, it contains important information on this line of treatment.

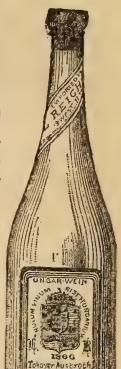
L. REICH,

DIRECT IMPORTER OF THE

CHOICEST AND PUREST

Hungarian WINES

EVER BROUGHT TO THIS COUNTRY,



STRICTLY FOR MEDICINAL USE.

13 West 11th St., New York.

Mr. REICH will be pleased to see those of the Medical Profession who may desire to avail themselves of the opportunity of procuring **STRICTLY FIRST-CLASS WINES**, which have received the endorsement of the most eminent Medical men of the country, as is evidenced from the following letters of commendation which have been received:—

This is to Certify, that I have examined Mr. L. REICH'S TOKAYER AUSBRUCH, TOKAYER MASLAS and BUDAI IMP. I take great pleasure in commending these Wines to the Medical Profession because of their purity.

R. OGDEN DOREMUS, M.D., LL.D.,
Prof. of Chem. and Toxicology in Bellevue Hosp. Med. Col., and Prof. of Chem. and Physics in Col. City of New York.

We have used in our practice the Hungarian Wines sold by Mr. LORENZ REICH, who puts them on the market unadulterated, just as they are imported. To this fact we attribute their great value as a medicine in diseases where such tonics are indicated, especially in those which are attended by defective digestion and imperfect assimilation. We cordially recommend Mr. REICH and his Wines to our professional brethren.

SCOTT'S EMULSION

PURE COD LIVER OIL

WITH

HYPOPHOSPHITES OF LIME AND SODA

PERFECT, PERMANENT, PALATABLE.

We respectfully ask the Medical Profession to give the above preparation a trial, knowing they will find it just the thing long desired, and obtain splendid results in the wasting diseases indicated by malnutrition and assimilation. The *perfect* and *permanent* union of the Cod Liver Oil with the Hypophosphites, and the thorough manner in which the nauseous taste is disguised, renders it so palatable that the most delicate stomach can retain it. The notable advantage it possesses over all other preparations, is its *permanency* as an *emulsion*, remaining for an almost unlimited time without the slightest separation or change, which enables the Physician always to prescribe it in its proper proportions. The oil is prepared expressly for us, and guaranteed strictly pure. We will gladly furnish, express paid, a 4-oz. sample to any Physician in the country who may not have been supplied.

Formula —50 per cent. of pure Cod Liver Oil, 6 grs. of the Hypophosphite of Lime, and 3 grs. of the Hypophosphite of Soda to a fluid ounce.

SCOTT & BOWNE,
Manufacturing Chemists, 125 Hudson Street, N. Y.

Messrs. SCOTT & BOWNE: NEW YORK, September 4, 1876.

Gents—I have prescribed Scott's Emulsion of Cod Liver Oil with Hypophosphites in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather, and is more palatable than any other preparation of oil that I have used.

Yours, very respectfully,
ROBERT WATTS, M.D., President Medical Board, Charity Hospital.

Messrs. SCOTT & BOWNE:

Gentlemen—Having given your Emulsion of Cod Liver Oil and Hypophosphites of Lime and Soda a fair trial during the past eighteen months, am very much pleased with the same, and consider it the best preparation of the kind in the market.

Yours, truly, J. H. HARTMAN, M.D., Baltimore, Md.

We also refer to the following Physicians, who use it and recommend it to the Profession:

G. C. SHATTUCK, M.D., 18 Stamford Street (Late Visiting Physician, Mass. General Hospital).
J. AYER, M.D., No. 6 Hancock Street, Boston.
G. W. GAY, M.D., 575 Tremont Street (Visiting Surgeon Boston City Hospital).
F. E. BUNDY, M.D., 99 Waltham Street, Boston.
W. B. MACKIE, M.D., 675 Tremont Street, Boston.
J. A. OCTERLONY, M.D., Louisville, Ky.
J. SIMONAUD, M.D., New Orleans.
G. LANE TANEYHILL, M D., Baltimore.
EDWARD A. MARIS, M D., Baltimore.

1128-1153eow

NOW IS THE TIME TO SUBSCRIBE

— FOR THE —

Cincinnati Lancet and Clinic,

THE LEADING WESTERN MEDICAL JOURNAL.

It has an able Corps of Contributors; Gives a Condensed Statement of the Progress of Medicine and Surgery; Reviews the Latest Medical Works; Publishes Society Proceedings, and keeps its Readers informed of the Medical News of the Day.

THE CINCINNATI LANCET AND CLINIC is issued *every Saturday*, and contains 20 large octavo double-columned pages of reading matter in every number, and is handsomely printed on fine tinted book paper, neither labor nor expense being spared to adapt it to the daily wants of the American practitioner of Medicine.

THE LANCET AND CLINIC is strictly an independent journal, not being controlled or published in the special interest of any College or Society, but is devoted to the advancement of science and progress of rational Medicine.

SPECIAL INDUCEMENTS.

NEW SUBSCRIBERS, who remit their names and subscription AT ONCE, will receive THE LANCET AND CLINIC from NOW until December 31, 1879,

FOR $3.50.

Address all communications to

Dr. J. C. CULBERTSON,
281 West Seventh Street, Cincinnati, Ohio.

1128-1153

THE SANITARIAN.

A MONTHLY MAGAZINE,

DEVOTED TO THE PRESERVATION OF HEALTH, MENTAL AND PHYSICAL CULTURE.

A. N. BELL, M.D., Editor. T. P. CORBALLY, M.D., Associate Editor.

"Nothing is more essential than knowledge of our homes and surroundings, and the means by which we can prolong life and increase our comfort, or avoid agents that are deleterious to health. This is the matter THE SANITARIAN gives."—*Johnstown Republican.*

"As its name implies, THE SANITARIAN is devoted entirely to Sanitary Science, in its liberal and proper sense. The field it occupies is a most important one, and the editor is admirably qualified for the work he has undertaken."—*Medical Examiner.*

"THE SANITARIAN is the *only journal published in this country devoted to the prevention of disease.* It contains in each number information to the farmer, mechanic, business man—in fact, to everybody—worth more than the subscription for a year. It is a solid, substantial and honest journal, gives its teachings in plain language, and has no claptraps to work off on its subscribers."—*Methodist Protestant.*

"The Sanitary question is now uppermost in the public mind, and it is gratifying to see that the discussion of it is not going to be kept as a "mystery" in the medical profession. Every human being is concerned in this matter; and if sanitary science has any suggestions to make they must be made directly to the people themselves. This is what the periodical before us aims to do, and this it is doing well."—*Popular Science Monthly.*

In the future, as in the past, it will be the constant effort of the editors to make THE SANITARIAN more and more worthy of the press and the generous support of the public. Its purposes are now so well understood, and, as shown by the extracts above given, so generally appreciated, that any additional prospectus is rendered unnecessary. **$3.00 a year; 30 cents a number. Bound volumes, postage paid, $4 00.**

All communications should be addressed: **THE SANITARIAN, New York.** 1140-1148

LONDON M'F'G CO.'S

ESSENCES OF MEATS,

FOR INVALIDS, INFANTS AND TRAVELERS.

ESSENCE OF BEEF, MUTTON, CHICKEN

Which consist solely of the finest juices from choice meats, extracted by a gentle heat, without the addition of water, or any substance whatever. They have been prescribed by the English Medical Profession for the past fifteen years, and since their introduction here have earned the highest commendations. They are peculiarly adapted

FOR INVALIDS—Natural, Pleasant, Refreshing.
FOR INFANTS—Strictly Pure; Prepared without Salt.
FOR DYSPEPTICS—Easily Assimilated.
IN CASES OF SEA SICKNESS—Afford Immediate Nourishment.
AFTER CHILDBIRTH—Meat Stimulant; Concentrated Form.

They retain the fine flavor and smell of the Meat. Are a heavy liquid in a warm temperature, and when placed upon ice take a jelly form, which is especially refreshing to Invalids. They are retained upon the stomach, in very critical cases, when the most carefully prepared soup is rejected. Children readily take them, and in many of their complaints requiring nourishment, "Essences" are UNEQUALED. *In summer, when opened, keep on Ice, leaving the lid partly raised.* DO NOT ADD WATER.

Taken cold direct from the Can, needing no Preparation whatever.

ENTIRELY TAKES THE PLACE OF BEEF TEA.

Physicians and Patrons are cordially invited to visit our Works.

PREPARED ONLY BY THE

LONDON MANUFACTURING COMPANY,

77 and 79 VARICK STREET, NEW YORK.

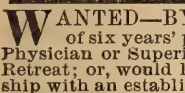
A FINE OPENING FOR A PHYSICIAN. On account of ill health, I wish to relinquish the field I have held the past twenty years, and offer it (with good will), together with office furniture and medicines, horse, sleigh, carriages, robes, harness, garden and stable tools, also residence and half acre of land, which have cost $8000 (altogether about $9000) for the small sum $4500. Terms $2000 down; the rest in annual installments of $500 and interest. The buildings are eleven years old, in good repair, heated by furnace; cellar cemented; a large brick cistern, a well, and a boiling spring, neither of which has ever been dry. This property is in one of the best locations for country practice in Maine; is in a pleasant village on the sea shore, upon high ground, with delightful scenery. None need apply who cannot conform to terms. Applicants must furnish reliable certificates of ability and integrity. Address "M. E." Box 1319, Portland, Maine. 1140-1141

WANTED—BY A YOUNG PHYSICIAN of six years' practice (married), a position as Physician or Superintendent of some Hospital or Retreat; or, would like to assist or form a partnership with an established Physician in a city. I will sell 1 fine Horse, 2 Good Buggies, 1 Cutter, Robes, etc., also a good Stock of Medicines, very cheap, to any one wishing to purchase an outfit. Address
E. B. HEADLY, M.D.,
1140-1142 Cornwall Bridge, Litchfield Co., Conn.

ARTIFICIAL EYES.



The finest, best, and most natural Artificial Eyes in the world, inserted, and sold at Wholesale and Retail, by Dr. THEO. ROTH, 336 N. Sixth St., Philadelphia, General Agent for the United States of L. Mueller's Celebrated German Artificial Eyes, which received the Gold Medal at Berlin, Vienna, Philadelphia (1876), etc. 1128-1140

DEXTRO-QUININE.

Equal to Sulphate of Quinine in the same dose—causes in large doses no cerebral distress nor irritability of the stomach—less than one-half as costly as Sulphate of Quinine.

From recent letters recording CLINICAL EVIDENCE OF THE VALUE OF DEXTRO-QUININE, we extract the following:

Mrs. S., æt. 22, married, no children, brunette, suffering from intermittent fever, first paroxysm Nov. 20th, 6 A.M., again at 4 P.M. Prescribed Cinchonidia sulphate, grs. XXX, chart No. V. One to be taken every two hours.

Nov. 21st. Return of paroxysm at 6 A.M. and 4 P.M. Gave Cinchonidia sulphate, grs. XLV, chart No. V. One to be taken every two hours.

Nov. 23d. Return of paroxysm at same time as on preceding days. Prescribed Dextro-Quinine, grs. XX, chart No. V. One to be taken every two hours. No return of chill since that date, and highly pleased with my experience.

N. H. MANRING, M. D.,
Rigdon, Ind.

Dec. 13th. I have used Dextro-Quinine in two cases of malarial fever complicated with so much irritability of the stomach that Quinine or Cinchonidia could not be given. The Dextro-Quinine was well tolerated by the stomach, and acted precisely like Quinine when given in the same doses.

WM. COMMONS, M. D.,
Union City, Ind.

K&M
One Ounce
DEXTRO-QUININE
"K&M."
COMPOSITION C40. H46. N4. O3.
DEXTRO-GYRATE WITH POLARIZED LIGHT.
This article is prepared from commercial purified Chinoidine and consists of the 'Amorphous Quinine' of Liebig or the 'Dicarchinia' of Hesse. It is equal to Sulphate of Quinine in the same dose, while in price it is less than one half as costly.
MANUFACTURED BY
KEASBEY & MATTISON.
CHEMISTS.
PHILADELPHIA. U.S.A.

Price, $1.50 Per Ounce.

Dec. 13th. I am using in the cases of typhoid fever under my charge, your Dextro-Quinine as a substitute for Sulphate of Quinine, in the same doses, and meet with the same effect. I think it an article of *genuine merit.*

D. E. WELLS, M. D.,
Bethlehem, N. H.

Nov. 29th. After using Dextro-Quinine in cases of ague, I deem it equally good, if not preferable to the Quinine Sulphate. Please give me the names of Druggists in St. Louis or Chicago, of whom I can get it.

C. J. RAGLAND, M. D.,
Mulberry Grove, Ill.

Dec. 14th. I have given Dextro-Quinine in two cases of Tertian ague, with the result of promptly arresting the chills. It caused no unpleasant "head symptoms" in either case. The doses were the same as ordinary doses of Quinine. H. A. RODEBAUGH, M. D., Reynoldsburg, O.

Dec. 12th. I find your Dextro-Quinine well tolerated by the stomach, and produces no distress. I think it has the advantage of Sulphate of Quinine in not producing headache and other disagreeable symptoms. L. NEWCOMB, M. D., N. Scituate, Mass.

Dec. 12th. I think the success attending my administration of your Dextro-Quinine in cases of remittent fever justifies me in saying better results could not be obtained with Sulphate of Quinine itself. It has the advantage of Quinine in not affecting the head and being less disagreeable to the palate. Jos. MULLANE, M. D., Lyons, Ind.

*** Practitioners unable to obtain Dextro-Quinine from their Druggists, can be supplied by us, through the mail, upon receipt of price.

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION, CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines, without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris; notably Drs. BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success.

Prepared by **E. GRILLON,** Pharmacien de lère classe, 27 Rue Rambuteau, Paris. To be had of all respectable Chemists throughout the world.

PEPTODYN.

The New Digestive is a combination of the whole of the Digestive Secretions—Pepsine, Pancreatine, Diastase, etc.,

Forming an invaluable remedy in the treatment of all forms of Dyspepsia, and diseases arising from imperfect nutrition.

N. B.—*The success of this Remedy has led to several imitations of it,* which consist largely of Milk Sugar, and, as compared with Peptodyn, are of little or no real value as digestive agents.

SAVORY & MOORE, 143 New Bond Street, London.

PARIS, 1867. Prize Medal.

1868. Silver Medal.

1872. Gold Medal.

1873, VIENNA. Medal of Merit.

BOUDAULT'S PEPSINE

IN POWDER, also WINE, ELIXIR, SYRUP, PILLS, AND LOZENGES OF PEPSINE.

Since the introduction of Pepsine by Boudault in 1854, **BOUDAULT'S PEPSINE HAS BEEN, AND IS STILL CONSIDERED, THE MOST RELIABLE,** as is attested by the awards it has received at the Exhibitions of 1867, 1868, 1872, 1873, and in 1876 at the Centennial Exposition in Philadelphia.

IT IS THE ONLY PEPSINE USED IN THE PARIS HOSPITALS.

Careful tests will enable any one to satisfy himself that **BOUDAULT'S PEPSINE HAS A DIGESTIVE POWER AT LEAST DOUBLE** that of the best Pepsines in the market, and that it is really the cheapest.

It is Sold in 1 ounce, 8 ounce, and 16 ounce Bottles.

Beware of so-called French Pepsines bearing fictitious names, and prescribe Boudault's only.

BLANCARD'S PILLS

OF UNCHANGEABLE IODIDE OF IRON.

Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired a so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of

Blancard

Pharmacien, No. 40 Rue Bonaparte, Paris.

without which none are genuine.

BEWARE OF IMITATIONS.

E. FOUCERA & CO., Agents,

NEW YORK.

TO PHYSICIANS.

THE scarcity and high prices of Cinchona barks and Sulphate of Quinia, and the prospect of only a slight reduction in these prices, makes the present a favorable opportunity of calling the attention of the profession to the *combination of all the bark alkaloids.*

Much attention has been given to this subject in Europe and India.

The growing appreciation by the medical profession of the United States of

CINCHO-QUININE

is due to the fact that it retains the important alkaloids IN COMBINATION, — a combination which in practice is *preferable to perfect isolation or separation* of these alkaloids.

In addition to its superior efficacy as a tonic and anti-periodic, it has the following advantages, which greatly increase its value to physicians : —

1st, *It exerts the full therapeutic influence of* Sulphate of Quinine, *in the same doses*, without oppressing the stomach, creating nausea, or producing cerebral distress, as the Sulphate of Quinine frequently does; and it produces much less constitutional disturbance.

2d, It has the great advantage of being *nearly tasteless.* The bitter is very slight, and not unpleasant to the most sensitive, delicate woman or child.

3d, It is *less costly :* the price will fluctuate with the rise and fall of barks, but will always be much less than the Sulphate of Quinine.

4th, It meets indications not met by that Salt.

The following well-known Analytical Chemists say : —

"UNIVERSITY OF PENNSYLVANIA, Jan. 22, 1875.
"I have tested CINCHO-QUININE, and have found it to contain *quinine, quinidine, cinchonine, cinchonidine.* F. A. GENTH,
Professor of Chemistry and Mineralogy."

"LABORATORY OF THE UNIVERSITY OF CHICAGO, Feb. 1, 1875.
"I hereby certify that I have made a chemical examination of the contents of a bottle of CINCHO-QUININE; and by direction I made a qualitative examination for *quinine, quinidine,* and *cinchonine,* and hereby certify that I found these alkaloids in CINCHO-QUININE.
C. GILBERT WHEELER,
Professor of Chemistry."

"I have made a careful analysis of the contents of a bottle of your CINCHO-QUININE, and find it to contain *quinine, quinidine, cinchonine,* and *cinchonidine.*
S. P. SHARPLES, *State Assayer of Mass.*"

TESTIMONIALS.

"WELLFLEET, MASS., Nov. 17, 1876.
"I have used CINCHO-QUININE, and can say without any hesitation it has proved superior to the sulphate of quinine. J. G. JOHNSON, M.D."

"MARTINSBURG, MO., Aug. 15, 1876.
"I use the CINCHO-QUININE altogether among children, preferring it to the sulphate.
DR. E. R. DOUGLASS."

"LIVERPOOL, PENN., June 1, 1876.
"I have used CINCHO-QUININE, obtaining better results than from the sulphate in those cases in which quinine is indicated.
DR. I. C. BARLOTT."

"RENFROW'S STATION, TENN., July 4, 1876.
"I am well pleased with the CINCHO-QUININE, and think it is a better preparation than the sulphate. W. H. HALBERT."

"ST. LOUIS, MO., April, 1875.
"I regard it as one of the most valuable additions ever made to our materia medica.
GEORGE C. PITZER, M.D."

"RICHMOND, VA., March 28, 1877.
"I believe that the *combination* of the several cinchona alkaloids is more generally useful in practice than the sulphate of quinine uncombined.
"Yours truly, LANDON B. EDWARDS, M.D.
Member Va. State Board of Health, and Sec'y and Treas. Medical Society of Va."

"CENTREVILLE, MICH.
"I have used several ounces of the CINCHO-QUININE, and have not found it to fail in a single instance. I have used no sulphate of quinine in my practice since I commenced the use of the CINCHO-QUININE, as I prefer it. F. C. BATEMAN, M.D."

"NORTH-EASTERN FREE MEDICAL DISPENSARY, 908 East Cumberland St., Philadelphia, Penn., Feb. 29, 1876.
"In typhoid and typhus fevers I always prescribe the CINCHO-QUININE in conjunction with other appropriate medicines, the result being as favorable as with former cases where the sulphate had been used.
"F. A. GAMAGE, M.D."

Quinine, 1-4 and 1-2 gr.
Strychnia, 1-100, 1-60, 1-40 and 1-30 gr.
Sulphur, Iodide, 1-25 and 1-10 gr.
Tartar Emetic, 1-100, 1-20 and 1-4 gr.
Zinc, Phosphide, 1-6, 1-4 and 1-2 gr.

VARIOUS FORMULAS.

Ammonium, Valerianate. 1 gr.
A convenient form of administration.
Assafœtida, 2 and 4 grs.
Assafœtida and Nux Vomica.
Made of purified Assafœtida.
Caffeia, Citrate, 1 gr.
Remedy and preventive in sick headache.
Calcium, Sulphide, 1-10 gr.
Scrofulous sores, &c.
Camphor, Mono-Bromated, 2 and 3 grs.
Hysteria, headache, nymphomania.
Cannabis Indica Extract. 1-2 and 1 gr.
Rheumatism, hysteria, delirium tremens.
Cerium, Oxalate, 1 and 2 grs.
Vomiting in pregnancy.
Coca Extract. 1 gr.
Tonic and stimulant.
Copaiba and Oleo-Resin Cubeb, 3 and 5 grs.
Of pure materials; can be relied upon.
Ergotin, 3 grs.
Made of purified Ergotin.
Fucus Vesiculosus Extract, 3 grs.
To decrease excessive obesity.
Grindelia Robusta Extract, 3 grs.
Hay fever, asthmatic affections.
Guarana Extract, 3 grs.
Headache, neuralgia.
Hypophosphites Compound.
A convenient form of administration.
Iodide of Iron (Blancard's), 1 gr.
Freshly prepared; superior to the imported.
Iron, Dialysed, 2 grs.
Made of Merck's scales.
Jaborandi Extract. 3 grs.
Diaphoretic and sialogogue.
Lithium, Bromide, 2 grs.
A better hypnotic than Brom. Pot.
Phosphates Iron, Quinine and Strychnine.
A tonic more convenient than the syrup.
Phosphorus, 1-100, 1-50, 1-30, 1-20, 1-12 gr
And over 20 combinations.
Salicin, 2 1-2 and 5 grs.
Useful in rheumatism.
Salicylic Acid, 2 1-2 and 5 grs.
Salicylic Acid and Morphine.
Valuable in rheumatism.
Sandal Wood Extract, 1 and 2 grs.
Contains both the oil and resin.
Sumbul Extract, 1 gr
Hysteria, spasmodic disorders.
Zinc, Phosphide, 1-6, 1-4 and 1-2 gr.
Zinc, Phosphide and Extract Nux Vomica.
Brain diseases.

Our Formula Book, (fourth edition) containing complete list of all our pills with formulas and therapeutical notes, together with partial list of our fluid extracts, with doses, furnished upon application. As we desire to *improve* in *every* particular, we will be grateful to any Physician who will write us regarding his experience with our Gelatine-Coated Pills and other preparations, or make any suggestions.

McKESSON & ROBBINS, Manufacturing Chemists,

91 Fulton Street, New York.

CAUTION!!—SPECIFY McKESSON & ROBBINS'.

☞ SUPERIOR TO PEPSIN OF THE HOG.

INGLUVIN

FROM THE

Ventriculus Callosus Gallinaceus.

A specific for VOMITING IN PREGNANCY, a potent and reliable remedy for the cure of INDIGESTION, DYSPEPSIA, and SICK STOMACH, caused from debility of that organ. It is superior to the Pepsin Preparations, since it acts with more certainty, and effects cures where they fail.

"A New Remedy, INGLUVIN."

By A. F. SHELLY, M.D., of Philadelphia.

"This is obtained from the gizzard of the domestic fowl (chicken), and is a *Specific for Vomiting in Pregnancy.* I have used this remedy for twenty-five years, and it has never failed. It is also the most *powerful* and *reliable remedy* for the *Cure* of *Indigestion, Dyspepsia,* and *Sick Stomach,* caused from debility of that organ. It is useful in all cases where pepsines and pancreatines are used, but with much more certainty of good results.

"In complicated affections of the Stomach, such as *Inflammation, Gastralgia, Pyrosis,* etc., it may be combined with Subnitrate of Bismuth and opiates; and in Diarrhœa and Cholera Infantum, with astringents, both vegetable and mineral. I have given the article to several prominent physicians, who have used it with the happiest results, among whom I may mention Prof. E. WALLACE, of the Jefferson Medical College."

AN EFFICIENT REMEDY AND AN AGREEABLE SUBSTITUTE FOR COD LIVER OIL.

PROF. TROUSSEAU'S

CARBONIZED

FRESH MEAT CURE.

Consisting of TENDER, RAW, LEAN BEEF, desiccated in vacuum, combined with CARBON as an antiseptic, and medicated with HYPOPHOSPHITES OF LIME, SODA, and POTASSA with CINCHONA. A medicated, nourishing food, pleasant to take and easily digested, for the cure of

Consumption, Chronic Dysentery, and Exhausted Conditions consequent upon Typhus and Typhoid Fevers, Typhoid Pneumonia, Diphtheria, General Debility, Nervousness, and Prostration from whatever cause.

In presenting this to the Medical Practitioners of the United States, we scarcely deem it necessary to extol a remedy the efficacy of which they must determine by actual trial. We believe, as Pharmaceutical Chemists, that we have overcome a difficulty by making this preparation of fresh meat stable under all circumstances; while, at the same time, it is potent, efficacious, and palatable.

WILLIAM R. WARNER & CO.,

1228 MARKET STREET, PHILADELPHIA,

MANUFACTURERS OF SUGAR-COATED PILLS.

FLUID EXTRACT COCA.

NERVINE, STIMULANT.

USED IN PERU AND BOLIVIA AS A MASTICATORY.

This Extract contains the entire properties of the leaf of the **Erythroxylon Coca.**

COCA WINE.

This wine has been successfully used in France as a **Tonic,** and found very desirable where a more mild effect of the Coca than the Fluid Extract was desired.

FLUID EXTRACT OF FUCUS VESICULOSUS

(BLADDER WRACK).

SUCCESSFULLY USED FOR THE REDUCTION OF OBESITY.

It seems to have no appreciable effect on the general health other than the removal of the adipose tissue.

The above Extracts have been prepared by us, and special care given that their medical properties be not impaired.

FLUID EXTRACT OF VISCUM ALBUM,

THE NEW SUBSTITUTE FOR ERGOT.

PROF. LISTER'S ANTISEPTIC DRESSING,

NEW YORK.

APOLLINARIS

NATURAL MINERAL WATER.

HIGHLY EFFERVESCENT.

Approved by the Academy of Medicine of France, and its sale in France authorized by special decree of the French Government.

"THE QUEEN OF TABLE WATERS."—*London Medical Record.*

PROFESSOR OSCAR LIEBREICH, Professor of Medical Chemistry, University of Berlin:—"After minute personal investigation, I can affirm that the Apollinaris Water is bottled according to all the rules of science, and is an entirely Natural Mineral Water."

PROFESSOR J. A. WANKLYN, Lecturer on Chemistry, St. George's Hospital, London:—"I have thoroughly examined the Apollinaris Spring and the method of bottling. The Apollinaris Water, as supplied to the public, is simply and purely a Natural Mineral water, impregnated only with its own gas."

PROFESSOR MOHR, Medical Councilor, University of Bonn:—"After exhaustive investigation, I declare the Apollinaris Water, as supplied to the public, to be purely natural in every respect, and of most excellent quality."

DR. THEODOR KYLL, Analytical Chemist, Town Councilor, Cologne (*expert appointed by United States Vice-Consul, October*, 1877), reported that "The Apollinaris Water, as bottled, deserves in every respect the name of an excellent natural acidulated water."

Every Genuine Bottle bears the REGISTERED YELLOW PICTORIAL LABEL of the Apollinaris Company, Limited, London.

To be had of all Wine Merchants, Grocers, Druggists, and Mineral Water Dealers throughout the United States, and Wholesale of

FREDK. DE BARY & CO., Sole Agents,

1117-1168 **41 and 43 WARREN STREET, NEW YORK.**

DUREL'S
TAR AND IRON SYRUP AND CAPSULES.

PREPARED BY DUREL, PHARMACIST, PARIS.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron is a desideratum which has at last been attained in these preparations. The indications for such a remedy are many, but it has been found especially useful in CHLOROSIS, BRONCHIAL CATARRH, CATARRH OF THE BLADDER, CHRONIC UTERINE DISCHARGES, depending upon an enfeebled or relaxed state of the system.

Sold by Chemists generally.

CRINON'S HÆMOGLOBIN,

The Albuminoid Ferruginous Principle of Blood.

HÆMOGLOBIN is the only physiological chalybeate. Associated as it is with the phosphates of the blood, it forms the most powerful of tonics, and at the same time a most nourishing food. It is especially useful in cases of *Anæmia, Chlorosis, Cachexias, Exhaustion* caused by excess of work, nervous debility, fatigue resulting from parturition and lactation. It replaces entirely liquid blood, which has been recommended and used with success in *Phthisis* and *wasting away.*

It is offered in two forms: In cachets (wafers), 60 of which are contained in a box; combined with chocolate in small squares, 30 of which are in a box; both forms can be sent by mail.

Prepared by C. CRINON, Paris, Pharmacist of the first class, Laureate of the Hospitals of Paris. Samples may be obtained by application to

E. FOUGERA & CO., New York, Agents for the U. S.

FOUGERA'S COMPOUND IODINISED
COD LIVER OIL.

Since the introduction of this oil in 1858, it has been found to be superior to all other kinds of Cod Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod Liver Oil, but also the **tonic, stimulant** and **alterative** properties of **Iodine, Bromine** and **Phosphorus**, which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod Liver Oil.

Through its **increased curative action, FOUGERA'S COD LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while invariable results will be obtained by its use in many advanced cases when the pure Cod Liver Oil would fail entirely.

FOUGERA'S READY-MADE MUSTARD PLASTERS.

A most useful, convenient, clean, and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths. Plasters No. 1, of pure mustard; Plasters No. 2, of one half mustard. Price 40 cents, the tin box, or tin roll, of 10 plasters each. DIRECTIONS.—Dip the Plaster, or Plasters, a minute or two, in cold water; apply on the part, and cover with a band.

FOUGERA'S COMPOUND ICELAND MOSS PASTE.

(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, etc.

Wakefulness, Cough, and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this Paste.

FOUGERA'S IODO-FERRO-PHOSPHATED ELIXIR OF HORSE-RADISH.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of antiscorbutic and aromatic plants, and acts as a **tonic, stimulant, emmenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

PNEUMATIC ASPIRATION,

AFTER THE MANNER OF DIEULAFOY.

"It is always possible, owing to Aspiration, to search for a fluid collection without any danger, whatever may be its seat or its nature."

"I have thrust these needles into almost every part of the body; into the Joints the Liver, the Spleen, the Bladder, the Intestines, the Lungs and the Meninges; and I can affirm, and a great number of observers affirm with me, that we have never seen consecutive accidents."—*Dieulafoy on Pneumatic Aspiration*, pp. 21, 24.

We invite the attention of the Medical Profession to this New Apparatus for Aspiration, constructed upon the general plan of Potain's modification of Dieulafoy's Aspirator, but containing the following improvements and inventions of our own:—

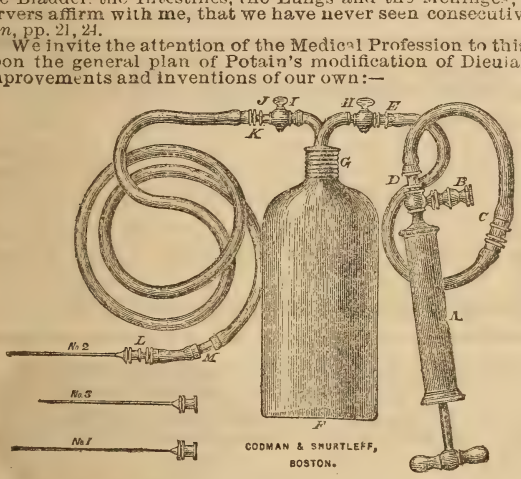

Fig. 68.

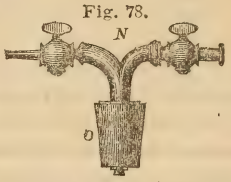
Fig. 77.

Fig. 78.



The Stopper and Cocks supplied with Apparatus No. 2.

1st. Means of changing the pump from an exhaust to a force-pump, and *vice versa*, thereby enabling the operator not only to draw an abnormal fluid, but to inject the cavity through the tubes and needle of the apparatus with one adapted to induce heat by action.—*See Dieulafoy on Aspiration*, pp. 276, 278.

2d. The employment, in our apparatus No. 1, of a metal Screw Cap, fitting the neck of the receiver supplied with this apparatus so securely that it cannot be forced from its place by condensed air while injecting, or accidentally removed while the receiver is in a state of vacuum for aspiration

3d. The substitution, for the ordinary oiled silk valves of other apparatus, of a kind indestructible, both in form and material.

4th. A simple and comparatively inexpensive attachment for evacuating the contents of the stomach, equal, if not superior, to any in use hitherto.

Commendations bestowed upon our Aspirators, by physicians familiar with the latest European and American ones, lead us to believe that, in some important particulars, at least, they are superior to any.

In his work on Pneumatic Aspiration, Dieulafoy shows the harmlessness of the Aspiratory puncture, and its great superiority to the Exploring Trocar as a means of accurate diagnosis in all collections of Pathological Fluids. It has been used with unprecedented success in the Retention of Urine, Reduction of Strangulated Hernia, in Ascites, Hydrothorax, Empyema, Pneumothorax, Effusions into the Pericardium, Serous, Purulent and Hematic Effusions of the Knee, Hydrocele, Hydatid Cysts, Abscesses of the Liver, and in various other Pathological Lesions.

PRICES OF APPARATUS.

No. 1. Air Pump—exhaust or condensing as described; 16 oz. receiver, of strong glass, with screw-cap; three steel, gold plated Aspiratory Needles, together with the necessary tubes, stop-cocks, etc., as shown in Fig. 77, fitted in a neat case, accompanied with printed directions $16.00. Postage 64 cents.

No. 2. The same, without receiver, and with rubber stopper (see Fig. 78) to fit almost any bottle of quart capacity, or less, instead of screw-cap arrangement, also with printed directions $14.00. Postage 32 cents.

No. 3. Dieulafoy's Notched Aspirator. Nickel-plated, with two Needles, Tubes, etc., in case.....$14 00

No. 4. Stomach Attachment, as described, adapted to pump accompanying Nos. 1 and 2, additional $6.00. Postage 22 cents.

The foregoing are the product of our own factory, and are warranted in every respect.

Also, **Dieulafoy on Pneumatic Aspiration,** post paid, by mail, on receipt of..... 3 40

☞ *Full description on application.*

An illustrated Catalogue of Surgical Instruments, also a New Pamphlet on Atomization of Liquids, with description of Improved Apparatus and Formulæ of Remedies successfully employed, will be forwarded, post-paid, on application.

TROMMER'S EXTRACT OF MALT.

The rapidly increasing demand for our IMPROVED EXTRACT OF MALT, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantities; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or moulding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expenses of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops**, viz: MALT SUGAR, DEXTRINE, DIASTASE, RESIN and BITTER of HOPS, PHOSPHATES of LIME and MAGNESIA, and ALKALINE SALTS.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:—
Malt Sugar 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712. Alkalies .377; Water, 25.7; Total, 99.958.
In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article.

Yours truly,
SILAS H. DOUGLAS,
Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt contains a larger quantity of the active properties of Malt than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ pounds of the Extract.

Our preparations of Malt are for sale by druggists generally, throughout the United States and Canada, at the following prices:—

EXTRACT OF MALT,	*With Hops (Plain)*,	- - - - - - -	$1.00

LIGHT-BROWN

COD LIVER OIL

SELECT MEDICAL OPINIONS.

Sir HENRY MARSH, Bart., M.D., T.C.D.,
Physician in Ordinary to the Queen, in Ireland.

"I have frequently prescribed Dr. De Jongh's Light-Brown Cod-Liver Oil. I consider it to be a very pure oil, not likely to create disgust, and a therapeutic agent of great value."

Dr. JONATHAN PEREIRA, F.R.S.,
Author of
"The Elements of Materia Medica and Therapeutics."

"It was fitting that the author of the best analysis and investigations into the properties of Cod-Liver Oil should himself be the purveyor of this important medicine. I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, *whom I regard as the highest authority on the subject.* The Oil is of the very finest quality, whether considered with reference to its color, flavor, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured."

Dr. EDWARD SMITH, F.R.S.,
Medical Officer to the Poor-Law Board of Great Britain.

"We think it a great advantage that there is one kind of Cod-Liver Oil which is universally admitted to be genuine—the Light-Brown Oil supplied by Dr. De Jongh. It has long been our practice, when prescribing the Oil, to recommend this kind, since, amidst so much variety and uncertainty, we have confidence in its genuineness."—(Extract from "Consumption: Its Early and Remediable Stages.")

Dr. PROSSER JAMES,
Lecturer on Materia Medica and Therapeutics at the London Hospital.

"I have always recognized your treatise on Cod-Liver Oil as the best on the subject, and adopted its conclusion as to the superiority of the Light-Brown over the Pale Oil. I have the less hesitation in expressing myself in this sense since I am only endorsing the opinion sent to you more than twenty years ago by Dr. Pereira, my illustrious predecessor in the chair of Materia Medica at the London Hospital."

Sir G. DUNCAN GIBB, Bart., M.D., LL.D.,
Physician and Lecturer on Forensic Medicine, Westminster Hospital.

"The experience of many years has abundantly proved the truth of every word said in favor of Dr. De Jongh's Light-Brown Cod-Liver Oil by many of our first Physicians and Chemists, thus stamping him as a high authority and an able Chemist, whose investigations have remained unquestioned."

Dr. LETHEBY,
Medical Officer of Health, and Chief Analyst to the City of London.

"In all cases I have found Dr. De Jongh's Light-Brown Cod-Liver Oil possessing the same set of properties, among which the presence of cholaic compounds, and of iodine in a state of organic combination, are the most remarkable. It is, I believe, universally acknowledged that this Oil has great therapeutic power; and, from my investigations, I have no doubt of its being a pure and unadulterated article."

Dr. BANKS,
King's Professor of the Practice of Physic at the University of Dublin.

"I have, in the course of my practice, extensively employed Dr. De Jongh's Light-Brown Cod-Liver Oil, and I have no hesitation in stating that I consider it the best of all the specimens of oil which have ever come under my notice. The fact of so able and accurate an observer as Dr. De Jongh subjecting the Oil to careful analysis previous to its exposure to sale, is a sufficient guarantee of its purity and excellence."

Dr. EDGAR SHEPPARD,
Professor of Psychological Medicine, King's College, London.

"Dr. Sheppard has made extensive use of Dr. De Jongh's Light-Brown Cod-Liver Oil, and has great pleasure in testifying to its superiority over every other preparation to be met with in this country. It has the rare excellence of being well borne and assimilated by stomachs which reject the ordinary Oils."

DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL is supplied ONLY in bottles sealed with BETT'S Patent Capsule, impressed on the top with Dr. DE JONGH'S Stamp, and on the side with his Signature, and the Signature of ANSAR, HARFORD & CO., and bearing under the wrapper a Label with the same Stamp and Signatures. WITHOUT THESE MARKS NONE CAN POSSIBLY BE GENUINE.

Sold in IMPERIAL half-pints, $1.00, by the Principal Druggists in the UNITED STATES.

SOLE CONSIGNEES,

TO THE MEDICAL PROFESSION.

MALTINE.

(Extract of Malted Barley, Wheat & Oats.)

THIS PREPARATION

Contains from three to five times the Medicinal and Nutritive elements found in Extract of Malt.

MALTINE is a highly concentrated extract of malted *Barley, Wheat,* and *Oats,* containing, undiminished and unimpaired, all the medicinal and nutritious principles found in these cereals. By the most carefully conducted scientific process we are enabled to offer to the medical profession a perfect article, possessing from *three* to *five times* the therapeutic and nutritive merit of any foreign or domestic Extract of Malt.

In support of our claims we invite the attention of the profession to the following points, viz.:

FIRST.—In the manufacture of **MALTINE** the evaporation necessary to reduce it to its great density is conducted in vacuo, at a temperature ranging from 100° to 120° Fahr.; while most manufacturers of Extract of Malt resort to "open pan" or low pressure steam boiling, by neither of which processes can the extract be so produced as to preserve the Diastase, Phosphates, and Albuminoids, on which its remedial value so greatly depends, and the product is either of a dark color or of low specific gravity, possessing little virtue aside from the saccharine matter which it contains *

SECOND.—*Carbon, Hydrogen, Nitrogen, Sulphur, Iron, Magnesium,* and *Potassium,* are essential elements in the food of man, and it is only in **MALTINE**, containing the combined properties of malted *Barley, Wheat,* and *Oats,* that all these principles can be found in the proper proportions; Extract of Malt made from *Barley alone* is wanting in some of the most important of these elements.

THIRD.—*Gluten* is the most nutritious principle found in the cereals, and is the only vegetable substance which will, alone, support life for any great length of time. It is composed of three distinct nitrogenous principles, together with fatty and inorganic matters, and is analogous to animal fibrin. **MALTINE** contains twenty times the quantity of *Gluten* found in any Extract of Malt.

FOURTH.—Liebig says, "Wheat and Oats stand first among our list of cereals in combining all the elements in proportions necessary to support animal life. They are especially rich in muscular and fat producing elements." The only reason we use Malted Barley, in the manufacture of **MALTINE**, is that it contains larger proportions of mineral matters (bone producers) and Diastase. It is deficient in all other essential elements.

We believe that any practitioner will readily recognize the superiority of MALTINE, and would request a trial and comparison of merits with any article offered for similar uses.

* As a sure test for Diastase, and the Albuminoids, a small quantity should be put in a test tube or small vial, largely diluted with water, and heated to the boiling point, when the Albumen, if present, will coagulate, and appear in little flocculent particles throughout the liquid. If the extract remains clear, it is proof that it has already been coagulated by excessive heat, and removed by filtration during the process of manufacturing. Any heat which will coagulate Albumen will inevitably destroy the digestive power of Diastase.

The Nitrogenous constituents of *MALTINE* have a composition identical with that of the chief constituents of the Blood, and therefore contain nearly every element requisite for the reproduction of the human body.

MALTINE AND ITS COMPOUNDS

can undoubtedly be used with greater success than any other remedy now known, in cases of general and nervous Debility, Indigestion, imperfect Nutrition and deficient Lactation; Pulmonary affections, such as Phthisis, Coughs, Colds, Hoarseness, Irritation of the Mucous Membranes and difficult expectoration; Cholera Infantum and wasting diseases of children and adults; Convalescence from Fevers, and whenever it is necessary to increase the vital forces and build up the system.

WE MANUFACTURE THE FOLLOWING PREPARATIONS, THE FORMULÆ AND DOSES OF WHICH ARE GIVEN IN OUR DOSE BOOKS, AND ON THE LABEL ATTACHED TO EACH BOTTLE:

***MALTINE* WITH HOPS.**

***MALTINE*, FERRATED:**

This combination is specially indicated in Anæmia and Chlorosis, and in all cases of defective nutrition where Iron is deficient in the system.

***MALTINE* WITH PHOSPHATES IRON AND QUINIA:**

A powerful general and nutritive tonic.

***MALTINE* WITH PHOSPHATES IRON, QUINIA AND STRYCHNIA:**

A powerful nutritive, general and nervous tonic.

***MALTINE* WITH PEPSIN AND PANCREATINE:**

One of the most effective combinations in Dyspepsia, Cholera Infantum, and all diseases resulting from imperfect nutrition. It contains three of the all-important digestive agents, Diastase being one of the constituents of the *MALTINE*. We believe there are few cases of Dyspepsia which will not readily yield to the medicinal properties of the above combination, while the system is invigorated by its nutritive qualities.

***MALTINE* WITH BEEF AND IRON:**

One of the most valuable combinations in cases of General Debility, when there is deficient nutrition and a deficiency of Iron in the system.

***MALTINE* WITH ALTERATIVES:**

In this preparation *MALTINE* is combined with the most valuable Alteratives known, such as Iodides, Bromides and Chlorides, and will fully meet the requirements of the practitioners in Syphilis, Scrofula, and all depraved conditions of the blood.

MALTINE WINE.

This preparation contains all the medicinal and nutritive constituents of *MALTINE*, less 60 per cent. of the transformed starch or glucose, which renders the preparation lighter and more acceptable to some stomachs, and is recommended only in such cases.

***MALTINE WINE* WITH PEPSIN AND PANCREATINE:**

(Each fluid ounce of MALTINE WINE contains 15 grains pure PEPSIN and 15 grains pure PANCREATINE).

We can recommend this preparation to the Medical Profession as being the most important remedy ever brought to their notice in all cases of Dyspepsia and Imperfect Nutrition, when the system needs invigorating and replenishing. It will be found, we believe, a perfect remedy in Vomiting in Pregnancy, Cholera Infantum and wasting diseases of children, and in Constipation and Chronic Diarrhœa resulting from mal-nutrition. It will agree with the most irritable stomach.

MALTO-YERBINE.

(Each pint of the above preparation contains 13 ounces MALTINE, 2 ounces CARRAGEEN and 1 ounce YERBINE).

With the nutritive, emollient and demulcent properties of *MALTINE* and *CARRAGEEN*, and the expectorant qualities of *YERBINE* (active principle of Yerba Santa), we offer this preparation to the Profession with the fullest confidence that it is the most perfect remedy yet produced in Chronic Pulmonary Affections, Irritation of the Mucous Membrane, Difficult Expectoration, Bronchitis and ordinary Coughs and Colds.

The Dose of all Preparations of *MALTINE* and compounds is from a dessert to a tablespoonful.

We also manufacture a perfectly prepared EXTRACT OF MALT, from *Barley only.*

MALTINE preparations are sold at the same prices as EXTRACT OF MALT and its combinations, and are put up in half-pint, pint and five-pint amber bottles; each bottle inclosed in a folding paper box.

RECENTLY PUBLISHED.

INJURIES OF THE EYE

AND THEIR

MEDICO-LEGAL ASPECT,

By FERDINAND VON ARLT, M. D.,

Professor of Ophthalmology in the University of Vienna, Austria.

TRANSLATED, WITH THE PERMISSION OF THE AUTHOR,

By CHAS. S. TURNBULL, M.D.,

Surgeon to the Eye and Ear Department of the Howard and of the German Hospitals, of Philadelphia.

One Volume, 12mo, cloth, $1.25.

"Such a booklet has long been needed in our language, and I am glad you have supplied the want."—*Prof. S. D. Gross.*

"The translation certainly bears intrinsic evidence, as I am convinced from a careful examination of it, of having been well and faithfully executed, and I hope that it will meet with the large circulation which it deserves. It is a useful addition to the literature of medical jurisprudence."—*Prof. Jas. Aitken Meigs.*

From the Legal Intelligencer, Philadelphia.

"Previous to the appearance of Prof. Arlt's work there were none but antiquated monographs on the subject; the references to ocular injuries in the best text-books were exceedingly brief and superficial, while medico-legal opinions in individual cases were too sparsely scattered through the archives and other periodical publications to call that attention to the subject which it demands, or to serve as a guide in case such attention had been aroused. An Index made with care, and very full, completes the value and usefulness of the monograph."

From the Medical and Surgical Reporter, Philadelphia.

"Professor Arlt's opinions stand in the very front rank of those of men of his special branch in Germany, and as the translator has been at once his pupil and friend, the accuracy of their presentment cannot be questioned."

From the New York Medical Journal.

"It is a book, which, we take it for granted, every specialist in the department will provide himself with; and it will also be a valuable addition to any general surgeon's library."

From the Boston Medical and Surgical Journal.

"It was written for the general profession, and not solely for the specialist, and has its scope well presented in the title. Dr. Turnbull has furnished a translation unusually free from traces of the German idiom, and it is printed with clear type, on good paper.

From the San Francisco Pacific Medical and Surgical Journal.

"Every country practitioner would do well to possess it, as there are numerous injuries of the eye to which he *must* attend. It is particularly full on foreign bodies in the eye; one of the commonest kinds of injury. The translation is good English, and not mongrel Latin, German, and English, as most translations of German works.

[Unguentum Petrolei]

SAMPLES FURNISHED ON APPLICATION.

THE POST-OFFICE LAWS

Forbid anything of an oleaginous nature being sent through the mail.

THEOPHILUS REDWOOD, Ph.D., F. C. S., Professor of Chemistry and Pharmacy to the Pharmaceutical Society of Great Britain, says, in reference to this preparation:—

"UNGUENTUM PETROLEI appears to be obtained from crude Petroleum by fractional distillation and subsequent purification. Products of a similar description have been introduced in pharmacy, and recommended as substitutes for animal or vegetable fats in the preparation of ointments or liniments.

"Among these the UNGUENTUM PETROLEI is distinguished by its having a firmer consistence and a higher melting point, and in these respects it resembles pure lard, from which it differs in that it is entirely free from liability to become rancid or to undergo any chemical change. It has an amber color, and a smooth, jelly-like appearance and is almost wholly free from odor or taste. It is free from, and insoluble in, water. It is very slightly soluble in rectified spirit, but very soluble in ether, in fixed oils and fats. I am of opinion that its characters and properties are such as to render it a valuable adjunct to our Materia Medica."

Dr. TILBURY FOX, London, writes:—"I like the UNGUENTUM PETROLEI very much indeed, and shall not fail to prescribe it."

From "THE LANCET," London, October 20th, 1878.—"Semi-transparent, pale yellow in color, and perfectly free from offensive smell. We consider it a valuable preparation, and hope its use will become as common in England as it is said to be in America."

From "THE MEDICAL TIMES AND GAZETTE," London, October 20th, 1878.—"The substance introduced under the name of UNGUENTUM PETROLEI is of about the consistence of good lard, has no smell, keeps any length of time, apparently without becoming rancid, and may be exposed to any kind of atmosphere without undergoing chemical change. It has long been, we understand, in use in America, where it enjoys a wide-spread popularity; and it will, we doubt not, come into extensive use here also, as a vehicle for making ointments, as a demulcent in various diseases of the skin, and as a lubricant."

NOW IS THE TIME TO SUBSCRIBE

— FOR THE —

Cincinnati Lancet and Clinic,

THE LEADING WESTERN MEDICAL JOURNAL.

It has an able Corps of Contributors; Gives a Condensed Statement of the Progress of Medicine and Surgery; Reviews the Latest Medical Works; Publishes Society Proceedings, and keeps its Readers informed of the Medical News of the Day.

THE CINCINNATI LANCET AND CLINIC is issued *every Saturday*, and contains 20 large octavo double-columned pages of reading matter in every number, and is handsomely printed on fine tinted book paper, neither labor nor expense being spared to adapt it to the daily wants of the American practitioner of Medicine.

THE LANCET AND CLINIC is strictly an independent journal, not being controlled or published in the special interest of any College or Society, but is devoted to the advancement of science and progress of rational Medicine.

SPECIAL INDUCEMENTS.

NEW SUBSCRIBERS, who remit their names and subscription AT ONCE, will receive THE LANCET AND CLINIC from NOW until December 31, 1879,

FOR $3.50.

Address all communications to

Dr. J. C. CULBERTSON,

LONDON M'F'G CO.'S
ESSENCES OF MEATS,

FOR INVALIDS, INFANTS AND TRAVELERS.

ESSENCE OF BEEF, MUTTON, CHICKEN

Which consist solely of the finest juices from choice meats, extracted by a gentle heat, without the addition of water, or any substance whatever. They have been prescribed by the English Medical Profession for the past fifteen years, and since their introduction here have earned the highest commendations. They are peculiarly adapted

FOR INVALIDS—Natural, Pleasant, Refreshing.
FOR INFANTS—Strictly Pure; Prepared without Salt.
FOR DYSPEPTICS—Easily Assimilated.
IN CASES OF SEA SICKNESS—Afford Immediate Nourishment.
AFTER CHILDBIRTH—Meat Stimulant; Concentrated Form.

They retain the fine flavor and smell of the Meat. Are a heavy liquid in a warm temperature, and when placed upon ice take a jelly form, which is especially refreshing to Invalids. They are retained upon the stomach, in very critical cases, when the most carefully prepared soup is rejected. Children readily take them, and in many of their complaints requiring nourishment, "Essences" are UNEQUALED. *In summer, when opened, keep on Ice, leaving the lid partly raised.* DO NOT ADD WATER.

Taken cold direct from the Can, needing no Preparation whatever.

ENTIRELY TAKES THE PLACE OF BEEF TEA.

Physicians and Patrons are cordially invited to visit our Works.

THE SANITARIAN.

A MONTHLY MAGAZINE,

DEVOTED TO THE PRESERVATION OF HEALTH, MENTAL AND PHYSICAL CULTURE.

A. N. BELL, M.D., Editor. T. P. CORBALLY, M.D., Associate Editor.

"Nothing is more essential than knowledge of our homes and surroundings, and the means by which we can prolong life and increase our comfort, or avoid agents that are deleterious to health. This is the matter THE SANITARIAN gives."—*Johnstown Republican.*

"As its name implies, THE SANITARIAN is devoted entirely to Sanitary Science, in its liberal and proper sense. The field it occupies is a most important one, and the editor is admirably qualified for the work he has undertaken."—*Medical Examiner.*

"THE SANITARIAN is the *only journal published in this country devoted to the prevention of disease.* It contains in each number information to the farmer, mechanic, business man—in fact, to everybody—worth more than the subscription for a year. It is a solid, substantial and honest journal, gives its teachings in plain language, and has no claptraps to work off on its subscribers."—*Methodist Protestant.*

"The Sanitary question is now uppermost in the public mind, and it is gratifying to see that the discussion of it is not going to be kept as a "mystery" in the medical profession. Every human being is concerned in this matter; and if sanitary science has any suggestions to make they must be made directly to the people themselves. This is what the periodical before us aims to do, and this it is doing well."—*Popular Science Monthly.*

In the future, as in the past, it will be the constant effort of the editors to make THE SANITARIAN more and more worthy of the press and the generous support of the public. Its purposes are now so well understood, and, as shown by the extracts above given, so generally appreciated, that any additional prospectus is rendered unnecessary. **$3.00 a year; 30 cents a number. Bound volumes, postage paid, $4 00.**

All communications should be addressed: **THE SANITARIAN, New York.** 1140-1141

LONG ISLAND COLLEGE HOSPITAL, BROOKLYN, NEW YORK.

TO PHYSICIANS.

—:o:—

In order to facilitate the introduction of the metric system, as well as to furnish a convenient posological table, we have published a Visiting List Dose Book, in which the doses are given both in the metric and in the apothecaries' weights and measures. It is light, and neatly bound in flexible silk covers, so that it may be carried in the visiting list or pocket, without inconvenience. This little book renders the use of the metric system easy and attractive, even to old practitioners. All physicians interested in the advancement of our science are urged to aid us in placing this little book in the hands of the profession, not only by sending for it themselves, but by ordering it for their friends. Sent free on receipt of six cents in postage.

Address, THE METRIC CLUB, 188 Clark Street, Chicago. 1141-1149x

NUMBERS OF THE HALF-YEARLY COMPENDIUM WANTED.—Any one sending us No. 16 or 19 of the COMPENDIUM will receive one dollar and postage. Address to

THE MEDICAL REGISTER AND DIRECTORY

OF THE

UNITED STATES,

SYSTEMATICALLY ARRANGED BY STATES:

COMPRISING

NAMES, POST-OFFICE ADDRESS, EDUCATIONAL AND PROFESSIONAL STATISTICS, OF MORE THAN 60,000 PHYSICIANS, WITH LISTS OF MEDICAL SOCIETIES, COLLEGES, HOSPITALS, AND OTHER MEDICAL INSTITUTIONS, WITH ABSTRACTS, OF THE MEDICAL LAWS OF EACH STATE, NOTES OF MINERAL SPRINGS, Etc.

BY

SAMUEL W. BUTLER, M. D.

SECOND EDITION, REVISED AND CORRECTED.

One Volume, large octavo, double columns, 874 pages. Price, Cloth, $5.50; Leather, $6.50.

The **SECOND EDITION** of this important work has been prepared at great cost of time and money. The lists have been carefully revised *by leading men in each State.* Nearly TEN THOUSAND new names have been added, and numerous corrections made. Those who have purchased the first edition will find this one to possess *all the value of a new work.*

This work has a *national* and *historic* value, as well as a present *business* one. Besides the names and addresses of all the physicians in the country, it contains the roster of the medical officers in the Army and Navy, list of the officers of State and County medical societies, a sketch of the medical geography of each State and Territory, analysis of the waters of all prominent mineral springs, and a mass of other information interesting to the profession. The collation of the *laws regulating the practice of medicine* in the various States is a feature of special interest and one not to be found in any other publication.

All who desire to reach medical men for business purposes, for instance, Life Insurance Companies, Medical Colleges, Wholesale Druggists, Importers and Manufacturers of Pharmaceutical Specialties, Dealers in Surgical Instruments, will find this book invaluable.

OPINIONS OF THE PRESS.

From the (London) *Lancet:*
This is the first work of the kind that has ever appeared on the other side of the Atlantic. The Editor and Compiler, Dr. S. W. Butler, and the publisher, are to be congratulated upon an undoubted success.

From the (London) *Medical Press and Circular:*
Upon opening its well-filled and well arranged pages our only surprise is that such a go-ahead race as our cousins have the credit of being, should have gone on so long without so valuable a book of reference.

From the (Philadelphia) *Medical Times:*
To publishers, druggists and those members of the profession whose sympathies and needs are wide enough to reach beyond their own immediate neighborhood, this book must be invaluable.

From the (Cincinnati) *Lancet and Observer:*
Of very great value, and will be to physicians what the city directory is to the man of business, a book he cannot get along very well without.

From the *Medical and Surgical Reporter:*
A volume of very considerable importance, the appreciation of which must grow in time, and it should find a place in every medical library of any pretensions of completeness.

115 South Seventh Street, Philadelphia.

SYRUP-GLYCEROLE
OF
FERROUS CHLORIDE.

The Combination which all Forms of Iron must assume before Assimilation.

Superior to all other Iron Salts in that, while it is readily taken into the circulation, and does referruginate the blood, it does not ordinarily cause constipation nor headache. It is very pleasant to the taste, and is unalterable.

Ferrous Chloride is a neutral salt, consequently it has no action upon the teeth, and may be administered fearlessly. This fact and the delightful taste of my preparation render it an advantageous form for administration to children. Each fluid drachm contains one grain of Ferrous Chloride, which, owing to the certainty of its assimilation, is a full, active, adult dose.

A FINE OPENING FOR A PHYSICIAN. On account of ill health, I wish to relinquish the field I have held the past twenty years, and offer it (with good will), together with office furniture and medicines, horse, sleigh, carriages, robes, harness, garden and stable tools, also residence and half acre of land, which have cost $8000 (altogether about $9000) for the small sum $4550. Terms $2000 down; the rest in annual installments of $500 and interest. The buildings are eleven years old, in good repair, heated by furnace; cellar cemented; a large brick cistern, a well, and a boiling spring, neither of which has ever been dry. This property is in one of the best locations for country practice in Maine; is in a pleasant village on the sea shore, upon high ground, with delightful scenery. None need apply who cannot conform to terms. Applicants must furnish reliable certificates of ability and integrity. Address "M. E." Box 1319, Portland, Maine. 1140-1141

WANTED—BY A YOUNG PHYSICIAN of six years' practice (married), a position as Physician or Superintendent of some Hospital or Retreat; or, would like to assist or form a partnership with an established Physician in a city. DEXTRO-QUININE.

Equal to Sulphate of Quinine in the same dose—causes in large doses no cerebral distress nor irritability of the stomach—less than one-half as costly as Sulphate of Quinine.

From recent letters recording CLINICAL EVIDENCE OF THE VALUE OF DEXTRO-QUININE, we extract the following:

Mrs. S., æt. 22, married, no children, brunette, suffering from intermittent fever, first paroxysm Nov. 20th, 6 A.M., again at 4 P.M. Prescribed Cinchonidia sulphate, grs. XXX, chart No. V. One to be taken every two hours.

Nov. 21st. Return of paroxysm at 6 A.M. and 4 P.M. Gave Cinchonidia sulphate, grs. XLV, chart No. V. One to be taken every two hours.

Nov. 23d. Return of paroxysm at same time as on preceding days. Prescribed Dextro-Quinine, grs. XX, chart No. V. One to be taken every two hours. No return of chill since that date, and highly pleased with my experience.

N. H. MANRING, M. D.,
Rigdon, Ind.

Dec. 13th. I have used Dextro-Quinine in two cases of malarial fever complicated with so much irritability of the stomach that Quinine or Cinchonidia could not be given. The Dextro-Quinine was well tolerated by the stomach, and acted precisely like Quinine when given in the same doses.

WM. COMMONS, M. D.,
Union City, Ind.

K&M
One Ounce
DEXTRO-QUININE
"K&M."
COMPOSITION C_{40}. H_{46}. N_4. O_3.
DEXTRO-GYRATE WITH POLARIZED LIGHT.
This article is prepared from commercial purified Chinoidine and consists of the 'Amorphous Quinine' of Liebig or the 'Dicinchonic' of Hesse. It is equal to Sulphate of Quinine in the same dose, while in price it is less than one half as costly.
MANUFACTURED BY
KEASBEY & MATTISON.
CHEMISTS.
PHILADELPHIA, U. S. A.

Price, $1.50 Per Ounce.

Dec. 13th. I am using in the cases of typhoid fever under my charge, your Dextro-Quinine as a substitute for Sulphate of Quinine, in the same doses, and meet with the same effect. I think it an article of *genuine merit.*

D. E. WELLS, M. D.,
Bethlehem, N. H.

Nov. 29th. After using Dextro-Quinine in cases of ague, I deem it equally good, if not preferable to the Quinine Sulphate. Please give me the names of Druggists in St. Louis or Chicago, of whom I can get it.

C. J. RAGLAND, M. D.,
Mulberry Grove, Ill.

Dec. 14th. I have given Dextro-Quinine in two cases of Tertian ague, with the result of promptly arresting the chills. It caused no unpleasant "head symptoms" in either case. The doses were the same as ordinary doses of Quinine. H. A. RODEBAUGH, M. D., Reynoldsburg, O.

Dec. 12th. I find your Dextro-Quinine well tolerated by the stomach, and produces no distress. I think it has the advantage of Sulphate of Quinine in not producing headache and other disagreeable symptoms. L. NEWCOMB, M. D., N. Scituate, Mass.

Dec. 12th. I think the success attending my administration of your Dextro-Quinine in cases of remittent fever justifies me in saying better results could not be obtained with Sulphate of Quinine itself. It has the advantage of Quinine in not affecting the head and being less disagreeable to the palate. Jos. MULLANE, M. D., Lyons, Ind.

DIFFERENTIAL DIAGNOSIS;

A MANUAL

OF THE

COMPARATIVE SEMEIOLOGY

OF THE MORE IMPORTANT DISEASES.

By F. DeHAVILLAND HALL, M.D.,

Assistant Physician to the Westminster Hospital, London.

American Edition, with Extensive Additions.

One Volume 8vo, pp. 205. Printed on handsome tinted paper; bound in English pebbled cloth, with beveled boards. Price, $2.00.

☞ SENT BY MAIL, POST-PAID, ON RECEIPT OF THE PRICE. ☜

Dr. HALL's work has received the highest encomiums from the English medical press, for its lucid arrangement, completeness, and accuracy. He himself is known in London as a practitioner of great skill, and an unusually successful medical teacher. His work has been considerably enlarged in this edition, the editor having devoted especial attention to (1) pointing out the *early* and often overlooked symptoms of disease (2), enumerating the *pathognomonic* symptoms, and (3) bringing into relief the *peculiar features* of diseases in this country.

Most of the diseases which may be confounded, are presented in comparative tables, setting forth their distinctive characteristics in the clearest possible light, and thus greatly facilitating their prompt diagnosis.

CONTENTS.

The contents follow, in a general way, the nomenclature of the College of Physicians; thus the work is divided into two parts, the one on General Diseases, the other on Local Diseases.

The First Part contains, among other matters—

The Symptoms of the Febrile State Defined.

[*See other side.*]

Comparative Table of the Temperature and Pulse in the Leading Febrile Diseases.

Differences between Symptomatic and Essential Fever.

Tabular Comparison of Rötheln, Scarlet Fever, Measles, and Smallpox.

Comparison of the Symptoms of Typhoid and Typhus; of Typhoid and Malarial Fever; of Typhoid and Typho-Malarial; of Typhoid Fever and the Typhoid State; of Typhoid and Relapsing Fever.

Diagnosis between Epidemic and Sporadic Cerebro-spinal Meningitis; between Epidemic Meningitis and Typhus; between the Same and Congestive Malarial Fever.

The Signs of the Arthritic, the Scrofulous, the Syphilitic, and the Tubercular Dyscrasiæ.

Gout, Rheumatism, and their Allies.

The Second Part includes the Diagnosis of Local Diseases; embracing, for example—

The Differential Points between Hemorrhage, Thrombosis, and Embolism in the Brain; between the various forms of Sclerosis, Syphilosis, Paralysis, and Ataxy of the Spinal Cord; and between Organic, Functional, Toxic, and Hysterical Paralyses. These extremely difficult problems in diagnosis are set forth with the utmost clearness.

Neuralgia and its Counterfeits (myalgia, spinal irritation, cerebral abscess, alcoholism, hysteria, etc).

Diagnostic Table of Acute, Chronic, Syphilitic, and Tubercular Laryngitis, Perichondritis, Benign and Malignant Growths, and Neuroses of the Larynx.

Distinctions between Inflammatory Croup and Spasmodic Croup, on the one hand, and Membranous Croup and Diphtheria, on the other.

Catarrhal as Distinct from Parenchymatous Tonsillitis.

Normal and Abnormal Chest Sounds (in all, eleven very carefully prepared tables).

Dr. John Hughes Bennett's General Rules for Diagnosing Heart and Lung Affections.

Comparison of the Three Forms of Phthisis.

The Diagnosis of Incipient Phthisis (sixteen different signs are given of its very earliest stage).

Differential Diagnoses between Incipient Phthisis and Bronchitis; between Acute Phthisis and Typhoid Fever; between Capillary Bronchitis and Pneumonia; between Pneumonia and Pleurisy; Pneumothorax and Pneumo-Hydrothorax, etc.

Dr. Dobell's Aphorisms on the Significance of Pain at and near the Heart; his Aphorisms on the Significance of Clubbing of the Finger Ends.

Diagnosis between the Various Cardiac, Aortic, and Mitral Diseases.

The Cheyne-Stokes Respiration Discussed.

To Distinguish Acidity of the Stomach from Fermentation and from Hypersecretion; Stomachal Vertigo from Cerebral Vertigo; Gastric Vomiting from Cerebral Vomiting.

Comparative Symptoms of Atonic Dyspepsia, Chronic Gastritis, Gastric Ulcer, and Gastric Cancer.

Special Points in the Diagnosis of Gastric Cancer.

The Symptoms of Dyspepsia, by Murchison.

Abdominal Phthisis as Distinguished from Typhoid Fever.

Hutchinson on the Diagnosis of Intestinal Obstruction.

Comparison of Enteritis with Colitis.

The Diagnosis of Hepatic Diseases.

Hardy's Handy Tests for Bile in the Urine.

What Pain in the Liver may Signify.

What Jaundice may Signify.

Hepatic Diseases Classified with Regard to the Size of the Liver.

The Symptoms of Internal Parasites.

The Earliest Signs of Bright's Disease.

The Seven Forms of Bright's Disease Compared.

The Four Forms of Diabetes Compared.

The Kinds of Calculi and their Tests.

Besides numerous other diseases and tables not mentioned above.

DOCTOR RABUTEAU'S

(Laureate of the Institute of France.)

DRAGEES, ELIXIR & SYRUP

Of Proto-Chloride of Iron.

"The experiments made in the hospitals of Paris have demonstrated that *Dr. Rabuteau's Dragees, Elixir and Syrup* regenerate the red globules of the blood with a rapidity never observed with the use of the other ferruginous preparations. These results have been proved by the various *Compt-Globules.*

"The ferruginous preparations of *Dr. Rabuteau* do not cause any constipation, and are perfectly tolerated by the weakest persons."—*Gazette des Hospitaux.*

Dr. Rabuteau's Elixir is prescribed when some difficulty is experienced in swallowing the Dragees; it is especially adapted to weak persons, whose digestive functions need strengthening or stimulating.

Dr. Rabuteau's Syrup is especially prepared for children, who take it readily, because of its agreeable taste.

MEYNET'S

DRAGEES OF COD-LIVER EXTRACT.

Careful experiments have established the fact that the **EXTRACT OF COD LIVERS** contains very valuable properties, which render it superior to the ordinary cod-liver oil. It is composed principally of *Gadwine,* large proportions of *Iodides, Chlorides, Bromides, Phosphoric Acid, Lime, Soda* and *Ammonia,* and especially *Propylamin,* all of which enter, but in very small proportions, into cod-liver oil.

These dragees of pure cod-liver extract take the place of cod-liver oil, and have been used with eminent success by medical celebrities of Europe in cases of *Scrofula, Rheumatic Affections, Rachitism, Phthisis,* and in all cases where a propylamic medication is indicated.

MEYNET'S DRAGEES are sold in bottles containing 100 dragees. Dose, 2 to 6 a day. Each dragee is equivalent to two tablespoonfuls of cod-liver oil.

MEYNET'S GRAINS are small granules intended for children. 10 are equivalent to 1 dragee.

E. FOUGERA & CO., New York, Agents for the U. S.

RIGOLLOT'S MUSTARD PAPER.

Is one of the most important and useful discoveries of the age, but it is not (as certain dealers of bad faith pretend) a preparation that any one can make, for it is not manufactured with a mustard that every one can buy.

RIGOLLOT'S MUSTARD PAPER.

Is the invention of Mr. P. RIGOLLOT, who is the exclusive owner; it is the only preparation which has been adopted by the civil and military hospitals and the armies and navies of France and England, and which has obtained a medal at the Centennial Exposition at Philadelphia. All other mustard plasters or leaves of whatever name, are but imitations of the original

RIGOLLOT'S MUSTARD PAPER.

Physicians will find it the most reliable sinapism, prompt and certain in its action, and will therefore always prescribe it. Every sheet in order to be genuine must bear the annexed signature of the inventor, *P. Rigollot*

Sold in tin boxes containing 10 sheets, also 25 and 100 sheets, by all respectable chemists throughout the world.

E. FOUCERA & CO., Agents,

NEW YORK.

TO PHYSICIANS.

THE scarcity and high prices of Cinchona barks and Sulphate of Quinia, and the prospect of only a slight reduction in these prices, makes the present a favorable opportunity of calling the attention of the profession to the *combination of all the bark alkaloids.*

Much attention has been given to this subject in Europe and India.

The growing appreciation by the medical profession of the United States of

CINCHO-QUININE

is due to the fact that it retains the important alkaloids IN COMBINATION, — a combination which in practice is *preferable to perfect isolation or separation* of these alkaloids.

In addition to its superior efficacy as a tonic and anti-periodic, it has the following advantages, which greatly increase its value to physicians : —

1st, *It exerts the full therapeutic influence of* Sulphate of Quinine, *in the same doses*, without oppressing the stomach, creating nausea, or producing cerebral distress, as the Sulphate of Quinine frequently does; and it produces much less constitutional disturbance.

2d, It has the great advantage of being *nearly tasteless.* The bitter is very slight, and not unpleasant to the most sensitive, delicate woman or child.

3d, It is *less costly;* the price will fluctuate with the rise and fall of barks, but will always be much less than the Sulphate of Quinine.

4th, It meets indications not met by that Salt.

The following well-known Analytical Chemists say : —

"UNIVERSITY OF PENNSYLVANIA, Jan. 22, 1875.
"I have tested CINCHO-QUININE, and have found it to contain *quinine, quinidine, cinchonine, cinchonidine.* F. A. GENTH,
Professor of Chemistry and Mineralogy."

"LABORATORY OF THE UNIVERSITY OF CHICAGO, Feb. 1, 1875.
"I hereby certify that I have made a chemical examination of the contents of a bottle of CINCHO-QUININE; and by direction I made a qualitative examination for *quinine, quinidine,* and *cinchonine,* and hereby certify that I found these alkaloids in CINCHO-QUININE.
C. GILBERT WHEELER,
Professor of Chemistry."

"I have made a careful analysis of the contents of a bottle of your CINCHO-QUININE, and find it to contain *quinine, quinidine, cinchonine,* and *cinchonidine.*
S. P. SHARPLES, *State Assayer of Mass.*"

TESTIMONIALS.

"WELLFLEET, MASS., Nov. 17, 1876.
"I have used CINCHO-QUININE, and can say without any hesitation it has proved superior to the sulphate of quinine. J. G. JOHNSON, M.D."

"MARTINSBURG, MO., Aug. 15, 1876.
"I use the CINCHO-QUININE altogether among children, preferring it to the sulphate.
DR. E. R. DOUGLASS."

"LIVERPOOL, PENN., June 1, 1876.
"I have used CINCHO-QUININE, obtaining better results than from the sulphate in those cases in which quinine is indicated.
DR. I. C. BARLOTT."

"RENFROW'S STATION, TENN., July 4, 1876.
"I am well pleased with the CINCHO-QUININE, and think it is a better preparation than the sulphate. W. H. HALBERT."

"ST. LOUIS, MO., April, 1875.
"I regard it as one of the most valuable additions ever made to our materia medica.
GEORGE C. PITZER, M.D."

"RICHMOND, VA., March 28, 1877.
"I believe that the *combination* of the several cinchona alkaloids is more generally useful in practice than the sulphate of quinine uncombined.
"Yours truly, LANDON B. EDWARDS, M.D.
Member Va. State Board of Health, and Sec'y and Treas. Medical Society of Va."

"CENTREVILLE, MICH.
"I have used several ounces of the CINCHO-QUININE, and have not found it to fail in a single instance. I have used no sulphate of quinine in my practice since I commenced the use of the CINCHO-QUININE, as I prefer it. F. C. BATEMAN, M.D."

"NORTH-EASTERN FREE MEDICAL DISPENSARY, 908 East Cumberland St., Philadelphia, Penn., Feb. 29, 1876.
"In typhoid and typhus fevers I always prescribe the CINCHO-QUININE in conjunction with other appropriate medicines, the result being as favorable as with former cases where the sulphate had been used.
"F. A. GAMAGE, M.D."

Poke Root Compound.
Rhubarb, U. S.
Rhubarb Compound, U. S.
Rhubarb Compound and Calomel.

GRANULES.

Aconitia, 1-60 gr.
Arsenious Acid, 1-50, 1-40, 1-30 and 1-20 gr.
Atropia, 1-60 gr.
Belladonna Extract, 1-4 gr.
Calcium, Sulphide, 1-10 gr.
Codeia, 1-16 and 1-5 gr.
Corros. Sublimate, 1-100, 1-40, 1-30 & 1-20 gr.
Digitalia, 1-60 gr.
Hydrastia, 1-2 gr.
Mercury, Bin-Iodide, 1-25 and 1-16 gr.
Mercury, Cyanide, 1-20 gr.
Mercury, Proto-Iodide, 1-5, 1-4 and 1-2 gr.
Morphia, Acetate, 1-8 and 1-4 gr.
Morphia, Muriate, 1-8 gr.
Morphia, Sulphate, 1-16, 1-10, 1-8, 1-6, 1-4 gr.
Morphia, Valerianate, 1-8 gr.
Podophyllin, 1-8 and 1-4 gr.
Quinine, 1-4 and 1-2 gr.
Strychnia, 1-100, 1-60, 1-40 and 1-30 gr.
Sulphur, Iodide, 1-25 and 1-10 gr.
Tartar Emetic, 1-100, 1-20 and 1-4 gr.
Zinc, Phosphide, 1-6, 1-4 and 1-2 gr.

VARIOUS FORMULAS.

Ammonium, Valerianate. 1 gr.
A convenient form of administration.
Assafœtida, 2 and 4 grs.
Assafœtida and Nux Vomica.
Made of purified Assafœtida.
Caffeia, Citrate, 1 gr.
Remedy and preventive in sick headache.
Calcium, Sulphide, 1-10 gr.
Scrofulous sores, &c.
Camphor, Mono-Bromated, 2 and 3 grs.
Hysteria, headache, nymphomania.
Cannabis Indica Extract. 1-2 and 1 gr.
Rheumatism, hysteria, delirium tremens.
Cerium, Oxalate, 1 and 2 grs.
Vomiting in pregnancy.
Coca Extract. 1 gr.
Tonic and stimulant.
Copaiba and Oleo-Resin Cubeb, 3 and 5 grs.
Of pure materials; can be relied upon
Ergotin, 3 grs.
Made of purified Ergotin.
Fucus Vesiculosus Extract, 3 grs.
To decrease excessive obesity.
Grindelia Robusta Extract, 3 grs.
Hay fever, asthmatic affections.
Guarana Extract, 3 grs.
Headache, neuralgia.
Hypophosphites Compound.
A convenient form of administration.
Iodide of Iron (Blancard's), 1 gr.
Freshly prepared; superior to the imported.
Iron, Dialysed, 2 grs.
Made of Merck's scales.
Jaborandi Extract. 3 grs.
Diaphoretic and sialogogue.
Lithium, Bromide, 2 grs.
A better hypnotic than Brom. Pot.
Phosphates Iron, Quinine and Strychnine.
A tonic more convenient than the syrup.
Phosphorus, 1-100, 1-50, 1-30, 1-20, 1-12 gr.
And over 20 combinations.
Salicin, 2 1-2 and 5 grs.
Useful in rheumatism.
Salicylic Acid, 2 1-2 and 5 grs.
Salicylic Acid and Morphine.
Valuable in rheumatism.
Sandal Wood Extract, 1 and 2 grs.
Contains both the oil and resin.
Sumbul Extract. 1 gr
Hysteria, spasmodic disorders.
Zinc, Phosphide, 1-6, 1-4 and 1-2 gr.
Zinc, Phosphide and Extract Nux Vomica.
Brain diseases.

Our Formula Book, (fourth edition) containing complete list of all our pills with formulas and therapeutical notes, together with partial list of our fluid extracts, with doses, furnished upon application. As we desire to *improve* in *every* particular, we will be grateful to any Physician who will write us regarding his experience with our Gelatine-Coated Pills and other preparations, or make any suggestions.

91 Fulton Street, New York.

CAUTION!!—SPECIFY McKESSON & ROBBINS'.

☞ SUPERIOR TO PEPSIN OF THE HOG.

INGLUVIN

FROM THE

Ventriculus Callosus Gallinaceus.

A specific for VOMITING IN PREGNANCY, a potent and reliable remedy for the cure of INDIGESTION, DYSPEPSIA, and SICK STOMACH, caused from debility of that organ. It is superior to the Pepsin Preparations, since it acts with more certainty, and effects cures where they fail.

"A New Remedy, INGLUVIN."

By A. F. SHELLY, M.D., of Philadelphia.

"This is obtained from the gizzard of the domestic fowl (chicken), and is a *Specific for Vomiting in Pregnancy.* I have used this remedy for twenty-five years, and it has never failed. It is also the most *powerful* and *reliable remedy* for the *Cure* of *Indigestion, Dyspepsia,* and *Sick Stomach,* caused from debility of that organ. It is useful in all cases where pepsines and pancreatines are used, but with much more certainty of good results.

"In complicated affections of the Stomach, such as *Inflammation, Gastralgia, Pyrosis,* etc., it may be combined with Subnitrate of Bismuth and opiates; and in Diarrhœa and Cholera Infantum, with astringents, both vegetable and mineral. I have given the article to several prominent physicians, who have used it with the happiest results, among whom I may mention Prof. E. WALLACE, of the Jefferson Medical College."

AN EFFICIENT REMEDY AND AN AGREEABLE SUBSTITUTE FOR COD LIVER OIL.

PROF. TROUSSEAU'S

CARBONIZED

FRESH MEAT CURE.

Consisting of TENDER, RAW, LEAN BEEF, desiccated in vacuum, combined with CARBON as an antiseptic, and medicated with HYPOPHOSPHITES OF LIME, SODA, and POTASSA with CINCHONA. A medicated, nourishing food, pleasant to take and easily digested, for the cure of

Consumption, Chronic Dysentery, and Exhausted Conditions consequent upon Typhus and Typhoid Fevers, Typhoid Pneumonia, Diphtheria, General Debility, Nervousness, and Prostration from whatever cause.

In presenting this to the Medical Practitioners of the United States, we scarcely deem it necessary to extol a remedy the efficacy of which they must determine by actual trial. We believe, as Pharmaceutical Chemists, that we have overcome a difficulty by making this preparation of fresh meat stable under all circumstances; while, at the same time, it is potent, efficacious, and palatable.

APOLLINARIS

NATURAL MINERAL WATER.

HIGHLY EFFERVESCENT.

Approved by the Academy of Medicine of France, and its sale in France authorized by special decree of the French Government.

"THE QUEEN OF TABLE WATERS."—*London Medical Record.*

PROFESSOR OSCAR LIEBREICH, Professor of Medical Chemistry, University of Berlin:—"After minute personal investigation, I can affirm that the Apollinaris Water is bottled according to all the rules of science, and is an entirely Natural Mineral Water."

PROFESSOR J. A. WANKLYN, Lecturer on Chemistry, St. George's Hospital, London:—"I have thoroughly examined the Apollinaris Spring and the method of bottling. The Apollinaris Water, as supplied to the public, is simply and purely a Natural Mineral water, impregnated only with its own gas."

PROFESSOR MOHR, Medical Councilor, University of Bonn:—"After exhaustive investigation, I declare the Apollinaris Water, as supplied to the public, to be purely natural in every respect, and of most excellent quality."

DR. THEODOR KYLL, Analytical Chemist, Town Councilor, Cologne (*expert appointed by United States Vice-Consul, October*, 1877), reported that 'The Apollinaris Water, as bottled, deserves in every respect the name of an excellent natural acidulated water."

Every Genuine Bottle bears the REGISTERED YELLOW PICTORIAL LABEL of the Apollinaris Company, Limited, London.

To be had of all Wine Merchants, Grocers, Druggists, and Mineral Water Dealers throughout the United States, and Wholesale of

FREDK. DE BARY & CO., Sole Agents,

1117-1168 **41 and 43 WARREN STREET, NEW YORK.**

DUREL'S
TAR AND IRON SYRUP AND CAPSULES.
PREPARED BY DUREL, PHARMACIST, PARIS.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron is a desideratum which has at last been attained in these preparations. The indications for such a remedy are many, but it has been found especially useful in CHLOROSIS, BRONCHIAL CATARRH, CATARRH OF THE BLADDER, CHRONIC UTERINE DISCHARGES, depending upon an enfeebled or relaxed state of the system.

Sold by Chemists generally.

CRINON'S HÆMOGLOBIN,
The Albuminoid Ferruginous Principle of Blood.

HÆMOGLOBIN is the only physiological chalybeate. Associated as it is with the phosphates of the blood, it forms the most powerful of tonics, and at the same time a most nourishing food. It is especially useful in cases of *Anæmia, Chlorosis, Cachexias, Exhaustion* caused by excess of work, nervous debility, fatigue resulting from parturition and lactation. It replaces entirely liquid blood, which has been recommended and used with success in *Phthisis* and *wasting away.*

It is offered in two forms: In cachets (wafers), 60 of which are contained in a box; combined with chocolate in small squares, 30 of which are in a box; both forms can be sent by mail.

Prepared by C. CRINON, Paris, Pharmacist of the first class, Laureate of the Hospitals of Paris. Samples may be obtained by application to

E. FOUGERA & CO., New York, Agents for the U. S.

FOUGERA'S COMPOUND IODINISED
COD LIVER OIL.

Since the introduction of this oil in 1858, it has been found to be superior to all other kinds of Cod Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod Liver Oil, but also the **tonic, stimulant** and **alterative** properties of **Iodine, Bromine** and **Phosphorus**, which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod Liver Oil.

Through its **increased curative action, FOUGERA'S COD LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod Liver Oil would fail entirely.

FOUGERA'S READY-MADE MUSTARD PLASTERS.

A most useful, convenient, clean, and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths. Plasters No. 1, of pure mustard; Plasters No. 2, of one half mustard. Price 40 cents, the tin box, or tin roll, of 10 plasters each. DIRECTIONS.—Dip the Plaster, or Plasters, a minute or two, in cold water; apply on the part, and cover with a band.

FOUGERA'S COMPOUND ICELAND MOSS PASTE.
(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, etc.

Wakefulness, Cough, and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this Paste.

FOUGERA'S IODO-FERRO-PHOSPHATED ELIXIR OF HORSE-RADISH.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of antiscorbutic and aromatic plants, and acts as a **tonic, stimulant, emmenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

To whom all orders should be addressed.

SOLD BY DRUGGISTS GENERALLY.

VACCINE VIRUS.

In order to meet properly the continued demand upon us for ANIMAL VIRUS, we have established stables for its propagation upon carefully selected heifers. The lymph used is of the well-known "Beaugency" stock, imported by ourselves expressly for this purpose. The result of several years' experience in supplying this lymph leads us to believe that its excellence is unsurpassed. The establishment is under the care of a competent physician, who will spare no pains to produce a perfectly RELIABLE and PURE article, which we are prepared to furnish FRESH, DAILY.

We can also furnish, to those who prefer it, HUMANIZED VIRUS, from healthy children, procured for us by physicians of undoubted reliability.

All our Virus is put up in strong, *air-tight, sealed packages*, for safe conveyance by mail or express, and will be sent (post-paid if by mail) upon the following terms:—

From the Heifer,	10 large Ivory Points, well charged on both sides	$1.50
	5 large Ivory Points, " " "	.80
	Large Ivory Points, less than 5, " " " each	.25
	1 Crust, new method, in air-tight Glass Capsule	2.00
From Healthy Infants,	10 small Ivory Points	1.50
	1 Crust from Unruptured Vesicles	2.00

Directions for vaccinating with either form of Virus, derived from methods successfully employed, will be furnished with Virus if requested.

We will warrant every package of Points and every Crust, giving a fresh supply in case of failure reported within fifteen days for Points, thirty days for Human, and ninety days for Kine Crusts. We can usually furnish Crusts one remove from the heifer, if preferred.

On account of their unreliability, we have hitherto furnished the usual form of Kine Crust unwillingly. Under our new method of taking and preserving them, however, after careful tests and an experience extending over several months, the results attained have been so satisfactory that we now offer them as not less active and reliable than other forms of Virus, while less liable to become inert with lapse of time. We now offer them on very favorable terms, and recommend them for transmission to a distance, and in all cases where it is desired to preserve Virus for some weeks or months, or to keep a supply at hand for emergencies.

We also furnish UNCHARGED IVORY POINTS, for physicians' use, at the following rates:—

Small	per 100, 25 cents;	per 1000 2.00
Large	per 100, 50 cents;	per 1000 4.00

Orders by mail or telegraph answered by return train.

Liberal discounts upon large supplies for Cities, Towns, and Institutions.

SCARIFYING VACCINATOR, STEEL, NICKEL PLATED. See Cut. Each 25 cents.

TROMMER'S EXTRACT OF MALT.

The rapidly increasing demand for our IMPROVED EXTRACT OF MALT, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantities; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or moulding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expenses of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops**, viz: MALT SUGAR, DEXTRINE, DIASTASE, RESIN and BITTER of HOPS, PHOSPHATES of LIME and MAGNESIA, and ALKALINE SALTS.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:—
Malt Sugar 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712. Alkalies .377; Water, 25.7; Total, 99.958.
In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article.

Yours truly,
SILAS H. DOUGLAS,
Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt contains a larger quantity of the active properties of Malt than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ pounds of the Extract.

Our preparations of Malt are for sale by druggists generally, throughout the United States and Canada, at the following prices:—

EXTRACT OF MALT,			*With Hops (Plain)*,	$1.00

THE MEDICAL REGISTER AND DIRECTORY

OF THE

UNITED STATES,

SYSTEMATICALLY ARRANGED BY STATES:

COMPRISING

NAMES, POST-OFFICE ADDRESS, EDUCATIONAL AND PROFESSIONAL STATISTICS, OF MORE THAN 60,000 PHYSICIANS, WITH LISTS OF MEDICAL SOCIETIES, COLLEGES, HOSPITALS, AND OTHER MEDICAL INSTITUTIONS, WITH ABSTRACTS, OF THE MEDICAL LAWS OF EACH STATE, NOTES OF MINERAL SPRINGS Etc.

BY

SAMUEL W. BUTLER, M. D.

SECOND EDITION, REVISED AND CORRECTED.

One Volume, large octavo, double columns, 874 pages. Price, Cloth, $5.50; Leather, $6.50.

The **SECOND EDITION** of this important work has been prepared at great cost of time and money. The lists have been carefully revised *by leading men in each State.* Nearly TEN THOUSAND new names have been added, and numerous corrections made. Those who have purchased the first edition will find this one to possess *all the value of a new work.*

This work has a *national* and *historic* value, as well as a present *business* one. Besides the names and addresses of all the physicians in the country, it contains the roster of the medical officers in the Army and Navy, list of the officers of State and County medical societies, a sketch of the medical geography of each State and Territory, analysis of the waters of all prominent mineral springs, and a mass of other information interesting to the profession. The collation of the *laws regulating the practice of medicine* in the various States is a feature of special interest and one not to be found in any other publication.

All who desire to reach medical men for business purposes, for instance, Life Insurance Companies, Medical Colleges, Wholesale Druggists, Importers and Manufacturers of Pharmaceutical Specialties, Dealers in Surgical Instruments, will find this book invaluable.

OPINIONS OF THE PRESS.

From the (London) *Lancet:*
This is the first work of the kind that has ever appeared on the other side of the Atlantic. The Editor and Compiler, Dr. S. W. Butler, and the publisher, are to be congratulated upon an undoubted success.

From the (London) *Medical Press and Circular:*
Upon opening its well-filled and well arranged pages our only surprise is that such a go-ahead race as our cousins have the credit of being, should have gone on so long without so valuable a book of reference.

From the (Philadelphia) *Medical Times:*
To publishers druggists and those members of the profession whose sympathies and needs are wide enough to reach beyond their own immediate neighborhood, this book must be invaluable.

From the (Cincinnati) *Lancet and Observer:*
Of very great value, and will be to physicians what the city directory is to the man of business, a book he cannot get along very well without.

From the *Medical and Surgical Reporter:*
A volume of very considerable importance, the appreciation of which must grow in time, and it should find a place in every medical library of any pretensions of completeness.

DIFFERENTIAL DIAGNOSIS;

A MANUAL

OF THE

COMPARATIVE SEMEIOLOGY

OF THE MORE IMPORTANT DISEASES.

By F. DeHAVILLAND HALL, M.D.,

Assistant Physician to the Westminster Hospital, London.

American Edition, with Extensive Additions.

One Volume 8vo, pp. 205. Printed on handsome tinted paper; bound in English pebbled cloth, with beveled boards. Price, $2.00.

☞ SENT BY MAIL, POST-PAID, ON RECEIPT OF THE PRICE. ☜

Dr. HALL's work has received the highest encomiums from the English medical press, for its lucid arrangement, completeness, and accuracy. He himself is known in London as a practitioner of great skill, and an unusually successful medical teacher. His work has been considerably enlarged in this edition, the editor having devoted especial attention to (1) pointing out the *early* and often overlooked symptoms of disease (2), enumerating the *pathognomonic* symptoms, and (3) bringing into relief the *peculiar features* of diseases in this country.

Most of the diseases which may be confounded, are presented in comparative tables, setting forth their distinctive characteristics in the clearest possible light, and thus greatly facilitating their prompt diagnosis.

CONTENTS.

The contents follow, in a general way, the nomenclature of the College of Physicians; thus the work is divided into two parts, the one on General Diseases, the other on Local Diseases.

The First Part contains, among other matters—

The Symptoms of the Febrile State Defined.

Comparative Table of the Temperature and Pulse in the Leading Febrile Diseases.

Differences between Symptomatic and Essential Fever.

Tabular Comparison of Rötheln, Scarlet Fever, Measles, and Smallpox.

Comparison of the Symptoms of Typhoid and Typhus; of Typhoid and Malarial Fever; of Typhoid and Typho-Malarial; of Typhoid Fever and the Typhoid State; of Typhoid and Relapsing Fever.

Diagnosis between Epidemic and Sporadic Cerebro-spinal Meningitis; between Epidemic Meningitis and Typhus; between the Same and Congestive Malarial Fever.

The Signs of the Arthritic, the Scrofulous, the Syphilitic, and the Tubercular Dyscrasiæ.

Gout, Rheumatism, and their Allies.

The Second Part includes the Diagnosis of Local Diseases; embracing, for example—

The Differential Points between Hemorrhage, Thrombosis, and Embolism in the Brain; between the various forms of Sclerosis, Syphilosis, Paralysis, and Ataxy of the Spinal Cord; and between Organic, Functional, Toxic, and Hysterical Paralyses. These extremely difficult problems in diagnosis are set forth with the utmost clearness.

Neuralgia and its Counterfeits (myalgia, spinal irritation, cerebral abscess, alcoholism, hysteria, etc).

Diagnostic Table of Acute, Chronic, Syphilitic, and Tubercular Laryngitis, Perichondritis, Benign and Malignant Growths, and Neuroses of the Larynx.

Distinctions between Inflammatory Croup and Spasmodic Croup, on the one hand, and Membranous Croup and Diphtheria, on the other.

Catarrhal as Distinct from Parenchymatous Tonsillitis.

Normal and Abnormal Chest Sounds (in all, eleven very carefully prepared tables).

Dr. John Hughes Bennett's General Rules for Diagnosing Heart and Lung Affections.

Comparison of the Three Forms of Phthisis.

The Diagnosis of Incipient Phthisis (sixteen different signs are given of its very earliest stage).

Differential Diagnoses between Incipient Phthisis and Bronchitis; between Acute Phthisis and Typhoid Fever; between Capillary Bronchitis and Pneumonia; between Pneumonia and Pleurisy; Pneumothorax and Pneumo-Hydrothorax, etc.

Dr. Dobell's Aphorisms on the Significance of Pain at and near the Heart; his Aphorisms on the Significance of Clubbing of the Finger Ends.

Diagnosis between the Various Cardiac, Aortic, and Mitral Diseases.

The Cheyne-Stokes Respiration Discussed.

To Distinguish Acidity of the Stomach from Fermentation and from Hypersecretion; Stomachal Vertigo from Cerebral Vertigo; Gastric Vomiting from Cerebral Vomiting.

Comparative Symptoms of Atonic Dyspepsia, Chronic Gastritis, Gastric Ulcer, and Gastric Cancer.

Special Points in the Diagnosis of Gastric Cancer.

The Symptoms of Dyspepsia, by Murchison.

Abdominal Phthisis as Distinguished from Typhoid Fever.

Hutchinson on the Diagnosis of Intestinal Obstruction.

Comparison of Enteritis with Colitis.

The Diagnosis of Hepatic Diseases.

Hardy's Handy Tests for Bile in the Urine.

What Pain in the Liver may Signify.

What Jaundice may Signify.

Hepatic Diseases Classified with Regard to the Size of the Liver.

The Symptoms of Internal Parasites.

The Earliest Signs of Bright's Disease.

The Seven Forms of Bright's Disease Compared.

The Four Forms of Diabetes Compared.

The Kinds of Calculi and their Tests.

Besides numerous other diseases and tables not mentioned above.

LONDON MF'G CO.'S

ESSENCES OF MEATS

FOR INVALIDS, INFANTS AND TRAVELERS.

ESSENCE OF BEEF, MUTTON, CHICKEN.

These Essences are the finest juices from choice meats, entirely free from fatty or injurious matter. They retain the fine flavor and smell of the meats. Are heavy liquids in a warm temperature and when placed upon Ice take a jelly form especially grateful to invalids. Children will readily take them, and in many of their complaints Essences are unequaled. Being used **WITHOUT WATER,** *they do not cause nausea as does Beef Tea, and they will remain upon the stomach when all other nourishment is rejected. In mental or physical prostration they act as strong stimulants, without the subsequent injurious effects produced by alcohol. In Dyspepsia and all Chronic Diseases of the Stomach, they are easily assimilated and are helpful in Consumption and other wasting diseases. Natural, pleasant and refreshing in fevers. Afford concentrated meat stimulant after child-birth. Are convenient for persons boarding or traveling.*

Taken cold direct from the can, needing no preparation whatever.

Sold by Druggists and Fine Grocers.

[Unguentum Petrolei]

SAMPLES FURNISHED ON APPLICATION.

THE POST-OFFICE LAWS

Forbid anything of an oleaginous nature being sent through the mail.

THEOPHILUS REDWOOD, Ph.D., F. C. S., Professor of Chemistry and Pharmacy to the Pharmaceutical Society of Great Britain, says, in reference to this preparation:—

"UNGUENTUM PETROLEI appears to be obtained from crude Petroleum by fractional distillation and subsequent purification. Products of a similar description have been introduced in pharmacy, and recommended as substitutes for animal or vegetable fats in the preparation of ointments or liniments.

"Among these the UNGUENTUM PETROLEI is distinguished by its having a firmer consistence and a higher melting point, and in these respects it resembles pure lard, from which it differs in that it is entirely free from liability to become rancid or to undergo any chemical change. It has an amber color, and a smooth, jelly-like appearance and is almost wholly free from odor or taste. It is free from, and insoluble in, water. It is very slightly soluble in rectified spirit, but very soluble in ether, in fixed oils and fats. I am of opinion that its characters and properties are such as to render it a valuable adjunct to our Materia Medica."

Dr. TILBURY FOX, London, writes:—"I like the UNGUENTUM PETROLEI very much indeed, and shall not fail to prescribe it."

From "THE LANCET," London, October 20th, 1878.—"Semi-transparent, pale yellow in color, and perfectly free from offensive smell. We consider it a valuable preparation, and hope its use will become as common in England as it is said to be in America."

From "THE MEDICAL TIMES AND GAZETTE," London, October 20th, 1878.—"The substance introduced under the name of UNGUENTUM PETROLEI is of about the consistence of good lard, has no smell, keeps any length of time, apparently without becoming rancid, and may be exposed to any kind of atmosphere without undergoing chemical change. It has long been, we understand, in use in America, where it enjoys a wide-spread popularity; and it will, we doubt not, come into extensive use here also, as a vehicle for making ointments, as a demulcent in various diseases of the skin, and as a lubricant."

TO PHYSICIANS.

—:o:—

In order to facilitate the introduction of the metric system, as well as to furnish a convenient posological table, we have published a Visiting List Dose Book, in which the doses are given both in the metric and in the apothecaries' weights and measures. It is light, and neatly bound in flexible silk covers, so that it may be carried in the visiting list or pocket, without inconvenience. This little book renders the use of the metric system easy and attractive, even to old practitioners. All physicians interested in the advancement of our science are urged to aid us in placing this little book in the hands of the profession, not only by sending for it themselves, but by ordering it for their friends. Sent free on receipt of six cents in postage.

DEXTRO-QUININE.

Equal to Sulphate of Quinine in the same dose—causes in large doses no cerebral distress nor irritability of the stomach—less than one-half as costly as Sulphate of Quinine.

From recent letters recording CLINICAL EVIDENCE OF THE VALUE OF DEXTRO-QUININE, we extract the following:

Mrs. S., æt. 22, married, no children, brunette, suffering from intermittent fever, first paroxysm Nov. 20th, 6 A.M., again at 4 P.M. Prescribed Cinchonidia sulphate, grs. XXX, chart No. V. One to be taken every two hours.

Nov. 21st. Return of paroxysm at 6 A.M. and 4 P.M. Gave Cinchonidia sulphate, grs. XLV, chart No. V. One to be taken every two hours.

Nov. 23d. Return of paroxysm at same time as on preceding days. Prescribed Dextro-Quinine, grs. XX, chart No. V. One to be taken every two hours. No return of chill since that date, and highly pleased with my experience.

N. H. MANRING, M. D.,
Rigdon, Ind.

Dec. 13th. I have used Dextro-Quinine in two cases of malarial fever complicated with so much irritability of the stomach that Quinine or Cinchonidia could not be given. The Dextro-Quinine was well tolerated by the stomach, and acted precisely like Quinine when given in the same doses.

WM. COMMONS, M. D.,
Union City, Ind.

R&M
One Ounce
DEXTRO-QUININE
"K&M"
COMPOSITION C20. H46. N4. O3.
DEXTRO-GYRATE WITH POLARIZED LIGHT
This article is prepared from commercial purified Chinoidine and consists of the 'Amorphous Quinine' of Liebig or the Diconchinia of Hesse. It is equal to Sulphate of Quinine in the same dose, while in price it is less than one half as costly.
MANUFACTURED BY
KEASBEY & MATTISON.
CHEMISTS.
PHILADELPHIA, U. S. A.

Price, $1.50 Per Ounce.

Dec 13th. I am using in the cases of typhoid fever under my charge, your Dextro-Quinine as a substitute for Sulphate of Quinine, in the same doses, and meet with the same effect. I think it an article of *genuine merit.*

D. E. WELLS, M. D.,
Bethlehem, N. H.

Nov. 29th. After using Dextro-Quinine in cases of ague, I deem it equally good, if not preferable to the Quinine Sulphate. Please give me the names of Druggists in St. Louis or Chicago, of whom I can get it.

C. J. RAGLAND, M. D.,
Mulberry Grove, Ill.

Dec. 14th. I have given Dextro-Quinine in two cases of Tertian ague, with the result of promptly arresting the chills. It caused no unpleasant "head symptoms" in either case. The doses were the same as ordinary doses of Quinine. H. A. RODEBAUGH, M. D., Reynoldsburg, O.

Dec. 12th. I find your Dextro-Quinine well tolerated by the stomach, and produces no distress. I think it has the advantage of Sulphate of Quinine in not producing headache and other disagreeable symptoms. L. NEWCOMB, M. D., N. Scituate, Mass.

Dec. 12th. I think the success attending my administration of your Dextro-Quinine in cases of remittent fever justifies me in saying better results could not be obtained with Sulphate of Quinine itself. It has the advantage of Quinine in not affecting the head and being less disagreeable to the palate. Jos. MULLANE, M. D., Lyons, Ind.

These results have been proved by the various *Compt-Globules.*

"The ferruginous preparations of *Dr. Rabuteau* do not cause any constipation, and are perfectly tolerated by the weakest persons."—*Gazette des Hospitaux.*

Dr. Rabuteau's Elixir is prescribed when some difficulty is experienced in swallowing the Dragees; it is especially adapted to weak persons, whose digestive functions need strengthening or stimulating.

Dr. Rabuteau's Syrup is especially prepared for children, who take it readily, because of its agreeable taste.

MEYNET'S

DRAGEES OF COD-LIVER EXTRACT.

Careful experiments have established the fact that the **EXTRACT OF COD LIVERS** contains very valuable properties, which render it superior to the ordinary cod-liver oil. It is composed principally of *Gaduine*, large proportions of *Iodides, Chlorides, Bromides, Phosphoric Acid, Lime, Soda* and *Ammonia*, and especially *Propylamin*, all of which enter, but in very small proportions, into cod-liver oil.

These dragees of pure cod-liver extract take the place of cod-liver oil, and have been used with eminent success by medical celebrities of Europe in cases of *Scrofula, Rheumatic Affections, Rachitism, Phthisis*, and in all cases where a propylamic medication is indicated.

MEYNET'S DRAGEES are sold in bottles containing 100 dragees. Dose, 2 to 6 a day. Each dragee is equivalent to two tablespoonfuls of cod-liver oil.

MEYNET'S GRAINS are small granules intended for children. 10 are equivalent to 1 dragee.

E. FOUGERA & CO., New York, Agents for the U. S.

RIGOLLOT'S MUSTARD PAPER.

Is one of the most important and useful discoveries of the age, but it is not (as certain dealers of bad faith pretend) a preparation that any one can make, for it is not manufactured with a mustard that every one can buy.

RIGOLLOT'S MUSTARD PAPER.

Is the invention of Mr. P. RIGOLLOT, who is the exclusive owner; it is the only preparation which has been adopted by the civil and military hospitals and the armies and navies of France and England, and which has obtained a medal at the Centennial Exposition at Philadelphia. All other mustard plasters or leaves of whatever name, are but imitations of the original

RIGOLLOT'S MUSTARD PAPER.

Physicians will find it the most reliable sinapism, prompt and certain in its action, and will therefore always prescribe it. Every sheet in order to be genuine must bear the annexed signature of the inventor, P. Rigollot

Sold in tin boxes containing 10 sheets, also 25 and 100 sheets, by all respectable chemists throughout the world.

E. FOUCERA & CO., Agents,

NEW YORK.

PHOSPHOROLE.

PHOSPHORUS and COD-LIVER OIL

have now an established position throughout the civilized world as important therapeutical agents. A *perfect combination* of the two has long been a desideratum, since they are both of value in the same disorders, while the cases in which one is demanded and the other contra-indicated are exceedingly rare.

The combination in PHOSPHOROLE has the twofold advantage of furnishing *the best possible form* for the administration of *phosphorus*, and *a more effective form* for the administration of *cod-liver oil*.

With regard to the former, it has been decided by the highest chemical and medical authorities that *phosphorus* should be administered *in a free state*, and in a vehicle which ensures its *perfect diffusion*, its *absolute unalterability*, and, as far as possible, its *prompt assimilation* without the gastric irritation to which the ordinary methods of exhibiting the agent give rise. It is well known that pills, emulsions, solutions in ether, chloroform, vegetable oils and resin, etc., have all failed to fulfill one or more of these conditions. Even an ordinary solution of phosphorus in cod-liver oil would not answer the purpose in all respects. We claim, however, that PHOSPHOROLE completely satisfies all the conditions. From the method of preparing it, in an atmosphere of dry carbonic acid, the phosphorus is *entirely dissolved without oxidation*, and by our mode of manipulation *a positive uniformity of strength* is ensured. It is then promptly bottled and sealed, and its *stability and permanence* thus secured. The exact amount of phosphorus in each dose is known, its efficiency is ensured, and the irritant effects upon the stomach are reduced to a minimum by the blandness of the oil. As a means then of administering *phosphorus* in the many cases in which it is indicated as a *nervous tonic and stimulant*, it is claimed that PHOSPHOROLE is the best attainable in the present state of our knowledge.

The value of *cod-liver oil* in phthisis is so familiar to the physician that it is needless to dwell upon it. But the value of *phosphorus* is also universally recognized in this disease, especially when complicated with nervous derangements. The *combination* of the two therefore furnishes a more effective form for the administration of cod-liver oil in the great majority of cases in which that remedy is indicated, and one which will at once commend itself to the profession.

A dose of two teaspoonfuls of PHOSPHOROLE contains $\frac{1}{100}$ of a grain of phosphorus. This dose, when given after a meal, is effective, and not very liable to interfere with digestion. *Phosphorus is cumulative in its action, and should be administered with watchful care.* About $\frac{1}{12}$ grain is considered the largest safe dose, and we rarely need go higher than $\frac{1}{20}$ or $\frac{1}{30}$ of a grain. At the very first appearance of the smallest gastric derangement, the exhibition of phosphorus should be stopped.

PHOSPHOROLE is handsomely put up in pint bottles only, and may be obtained at all first-class druggists throughout the United States.

Descriptive Circulars furnished upon application.

Correspondence with Physicians solicited.

BILLINGS, CLAPP & CO.,

MANUFACTURING CHEMISTS, BOSTON.

THE THREE BEST TONICS OF THE PHARMACOPŒIA:

IRON, PHOSPHORUS, CALISAYA.

CASWELL, HAZARD & CO. call the attention of the Profession to their preparation of the above estimable Tonics, as combined in their elegant and palatable

FERRO-PHOSPHORATED ELIXIR OF CALISAYA BARK.

A combination of the Pyrophosphate of Iron and Calisaya never before attained, in which the nauseous inkiness of the iron and astringency of the Calisaya are overcome, without any injury to their active tonic principles, and blended into a beautiful Amber-colored Cordial, delicious to the taste and acceptable to the most delicate stomach. This preparation is made directly from the **ROYAL CALISAYA BARK**—not from **its ALKALOIDS OR THEIR SALTS**—being unlike other preparations called "Elixir of Calisaya and Iron," which are simply an **Elixir of Quinine and Iron.** Our Elixir can be depended upon as being a true Elixir of Calisaya Bark with Iron. Each dessertspoonful contains seven and a half grains Royal Calisaya Bark, and two grains Pyrophosphate of Iron.

Ferro-Phosphorated Elixir of Calisaya Bark with Strychnia. This preparation contains one grain of Strychnia added to each pint of our Ferro-Phosphorated Elixir of Calisaya Bark, greatly intensifying its tonic effect.

Ferro-Phosphorated Elixir of Calisaya with Bismuth, containing eight grains Ammonio-Citrate of Bismuth in each tablespoonful of the Ferro Phosphorated Elixir of Calisaya Bark.

Elixir Phosphate Iron, Quinine and Strychnia. Each teaspoonful contains one grain Phosphate Iron, one grain Phosphate Quinine, and one sixty-fourth of a grain of Strychnia.

Ferro-Phosphororated Elixir of Gentian, containing one ounce of Gentian and one hundred and twenty-eight grains Pyrophosphate Iron to the pint, making in each dessertspoonful seven and one half grains Gentian and two grains Pyrophosphate Iron.

Ferro-Phosphorated Wine of Wild Cherry Bark. Each fluid-drachm contains twenty-five grains of the Bark, and two grains of Ferri-Pyrophosphate.

Elixir Taraxacum Comp. Each dessertspoonful contains fifteen grains of Taraxacum.

Elixir Pepsin, Bismuth, and Strychnine. Each fluid-drachm contains one sixty-fourth of a grain of Strychnine.

Juniper Tar Soap. Highly recommended by the celebrated Erasmus Wilson, and has been found very serviceable in chronic eczema and diseases of the skin generally. It is invaluable for chapped hands and roughness of the skin caused by change of temperature. It is manufactured by ourselves, from the purest materials, and is extensively and successfully prescribed by the most eminent Physicians.

APOLLINARIS

NATURAL MINERAL WATER.

HIGHLY EFFERVESCENT.

Approved by the Academy of Medicine of France, and its sale in France authorized by special decree of the French Government.

"THE QUEEN OF TABLE WATERS."—*London Medical Record.*

PROFESSOR OSCAR LIEBREICH, Professor of Medical Chemistry, University of Berlin:—"After minute personal investigation, I can affirm that the Apollinaris Water is bottled according to all the rules of science, and is an entirely Natural Mineral Water."

PROFESSOR J. A. WANKLYN, Lecturer on Chemistry, St. George's Hospital, London:—"I have thoroughly examined the Apollinaris Spring and the method of bottling. The Apollinaris Water, as supplied to the public, is simply and purely a Natural Mineral water, impregnated only with its own gas."

PROFESSOR MOHR, Medical Councilor, University of Bonn:—"After exhaustive investigation, I declare the Apollinaris Water, as supplied to the public, to be purely natural in every respect, and of most excellent quality."

DR. THEODOR KYLL, Analytical Chemist, Town Councilor, Cologne (*expert appointed by United States Vice-Consul, October*, 1877), reported that "The Apollinaris Water, as bottled, deserves in every respect the name of an excellent natural acidulated water."

Every Genuine Bottle bears the REGISTERED YELLOW PICTORIAL LABEL of the Apollinaris Company, Limited, London.

To be had of all Wine Merchants, Grocers, Druggists, and Mineral Water Dealers throughout the United States, and Wholesale of

1117-1168 **41 and 43 WARREN STREET, NEW YORK.**

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION,

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil, by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM, instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat, in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion may therefore be regarded as Chyle obtained by nature's own process. In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more stable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatized Cod-Liver Oil, the active digestive principle of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Pancreatine effects the digestion and assimilation of Cod-Liver Oil and Fat, as well as Food generally. This palatable and popular remedy is therefore invaluable to PATIENTS WHO ARE UNABLE TO DIGEST COD-LIVER OIL, and who are thus deprived of its nourishing and invigorating properties.

Pancreatine Wine. An excellent vehicle for taking Cod-Liver Oil and promoting the digestion of it.

TO THE MEDICAL PROFESSION.

LACTOPEPTINE,

The most important remedial agent ever presented to the Profession for Indigestion, Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all diseases arising from Imperfect Nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase, or Veg. Ptyalin, Lactic and Hydrochloric Acids, in Combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk.....40 ounces.	Veg. Ptyalin or Diastase.....4 drachms.
Pepsin.....8 ounces.	Lactic Acid.....5 fl. drachms.
Pancreatine.....6 ounces.	Hydrochloric Acid.....5 fl. drachms.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its almost universal adoption by the Profession is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned having tested LACTOPEPTINE, recommend it to the Profession:—

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine, University of the City of New York.

LEWIS A. SAYRE, M.D.,
Professor of Orthopædic Surgery and Clinical Surgery, Bellevue Hospital Medical College.

F. LE ROY SATTERLEE, M.D., PH.D.,
Professor of Chem., Mat. Med. and Therap. in the N. Y. College of Dent.; Prof. of Chem. and Hygiene in the Am. Vet. College, etc., etc.

SAMUEL R. PERCY, M.D.,
Professor Materia Medica, New York Medical College.

A. VAN DEVEER, M.D.,
ALBANY, N. Y., June 8th, 1878.
Prof. of the Prin. and Prac. of Surg., Albany Med. Col.; Surg. Albany and St. Peter's Hospitals.
"I have given LACTOPEPTINE a good thorough trial, and have been greatly pleased with the excellent results that have followed its administration."

JOHN H. PACKARD, M.D.,
PHILADELPHIA, PA., May 30th, 1878.
Pres't Phila. Co. Obstet. Society; Surg. Episcopal and Women's Hospitals
"I have found great satisfaction in the use of LACTOPEPTINE, and have ordered it frequently in cases of Dyspepsia, especially where there is want of tone and defective secretion."

JAS. AITKEN MEIGS, M.D.,
PHILADELPHIA, June 20th, 1878.
Prof. of the Institutes of Med. and Med. Juris., Jeff. Medical College; Phy. to Penn. Hos.
"I have used LACTOPEPTINE with very good effect in a number of cases of Dyspepsia."

W. W. DAWSON, M.D.,
CINCINNATI, O., June 21st, 1878.
Prof. Prin. and Prac. Surg., Med. Col. of Ohio; Surg. to Good Samaritan Hospital.
"I have used LACTOPEPTINE with great advantage in cases of feeble digestion."

ALBERT F. A. KING, M.D.,
WASHINGTON, D. C., June 19th, 1878.
Prof. of Obstetrics, University of Vermont.
"I have used LACTOPEPTINE both in hospital and private practice, and have found it to answer fully the purposes for which it is recommended. As an immediate aid to the digestive function, I know of no remedy which acts more directly."

D. W. YANDELL, M.D.,
LOUISVILLE, KY., March 7th, 1878.
Prof. of the Science and Art of Surg. and Clinical Surg., University of Louisville.
"I have made much use of LACTOPEPTINE, and take great pleasure in stating that it has rarely disappointed me. I shall, of course, continue to prescribe it."

ROBT. BATTEY, M.D.,
ROME, GA., June 8th, 1878.
Emeritus Prof. of Obstetrics, Atlanta Med. College, and Ex-Pres. Med. Association of Ga.
"I have used LACTOPEPTINE in a case of Dyspepsia with satisfaction. I think well of it."

CLAUDE H. MASTIN, M.D., LL.D.,
MOBILE, ALA., June 8th, 1878.
"I consider LACTOPEPTINE the very best preparation of the kind which I have ever employed, and for patients with feeble digestion I know of nothing that is equal to it."

Prof. H. C. BARTLETT, PH.D., F.C.S.,
LONDON, ENG., February 22d, 1876.
"I find the preparation of LACTOPEPTINE contains within itself all the principles required to promote a healthy digestion.

PRICE LIST.

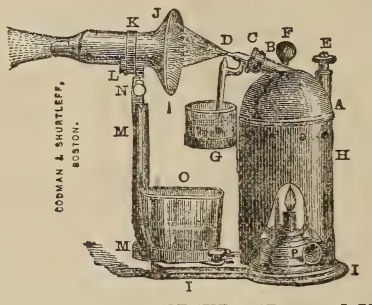
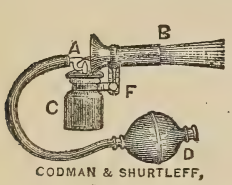
ATOMIZING APPARATUS.

PRICES REDUCED.

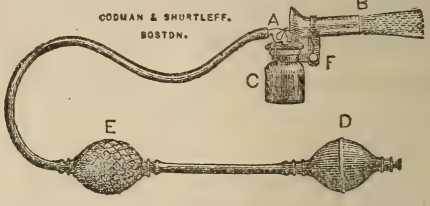


THE COMPLETE STEAM ATOMIZER. (Patented March 24, 1868.)

All its joints are hard-soldered.
Every one is tested by hydrostatic pressure, to more than one hundred pounds to the square inch.
It cannot be injured by exhaustion of water, or any attainable pressure, and will last for many years.
It does not throw spirts of hot water, is convenient, durable, portable, compact, and cheap, in the best sense of the word. Price $5.00. Postage 59c.
Brass parts, nickel-plated, additional, $2.00.
Neatly made, strong Black Walnut Box, with convenient Handle, additional, $2.50. Postage 44c.



THE BOSTON ATOMIZER. (Patented.)



SHURTLEFF'S ATOMIZING APPARATUS. (Patented.)

The most desirable Hand Apparatus. Rubber warranted of the very best quality. Valves imperishable, every one carefully fitted, and will work perfectly in all positions. Price $3.50.
The Bulbs are adapted to all the Atomizing Tubes made by us.
Each of the above Apparatus is supplied with two carefully-made annealed glass Atomizing Tubes, and accompanied with directions for use. Each Apparatus is carefully packed for transportation, and warranted perfect.

13 and 15 TREMONT STREET, BOSTON.

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt. and all its combinations.

Extract of Malt,

WITH COD-LIVER OIL,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO,

(See Transactions of American Medical Association, for 1876, page 176.)

Is presented to the medical profession as an efficient, palatable and very stable combination, consisting of equal parts of the ***Extract of Canadian Barley Malt*** and the best quality of genuine ***Norwegian Cod-liver Oil.*** Many patients take this preparation who cannot take the oil in any other form. It may be employed in all cases where Cod-liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

Extract of Malt,

WITH COD-LIVER OIL AND PHOSPHORUS,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod-liver Oil, Phosphorus being added in the proportion of $\frac{1}{100}$ grain to the dose, and so combined as to be perfectly protected from oxidation. The ***Trommer Extract of Malt Company*** prepare this combination agreeably to the suggestion of ***Dr. Wilson Fox.*** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

Extract of Malt,

WITH COD-LIVER OIL AND IODIDE OF IRON

added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod-liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians, referring to it in terms of high praise.

1090-1115eow

LONDON MF'G CO.'S ESSENCES OF MEATS

FOR INVALIDS, INFANTS AND TRAVELERS.

ESSENCE OF BEEF, MUTTON, CHICKEN.

These Essences are the finest juices from choice meats, entirely free from fatty or injurious matter. They retain the fine flavor and smell of the meats. Are heavy liquids in a warm temperature and when placed upon Ice take a jelly form especially grateful to invalids. Children will readily take them, and in many of their complaints Essences are unequaled. Being used **WITHOUT WATER,** *they do not cause nausea as does Beef Tea, and they will remain upon the stomach when all other nourishment is rejected. In mental or physical prostration they act as strong stimulants, without the subsequent injurious effects produced by alcohol. In Dyspepsia and all Chronic Diseases of the Stomach, they are easily assimilated and are helpful in Consumption and other wasting diseases. Natural, pleasant and refreshing in fevers. Afford concentrated meat stimulant after child-birth. Are convenient for persons boarding or traveling.*

Taken cold direct from the can, needing no preparation whatever.

Sold by Druggists and Fine Grocers.

1879. BEGIN NOW! 1879.

UNEQUALED INDUCEMENTS!

NEW SUBSCRIBERS WILL RECEIVE

THE WEEKLY

MEDICAL AND SURGICAL REPORTER

From October, 1878 until December 31st, 1879,

FOR $5.00!

The MEDICAL AND SURGICAL REPORTER has been established over thirty years, and has, it is believed, a *bonâ fide* subscription list, unsurpassed by any medical weekly in America.

It is issued every Saturday, neatly cut and bound, and gives 24 large octavo, double-columned pages of reading matter in each number. It claims the following

SPECIAL FEATURES.

IT IS INDEPENDENT, being controlled by no clique, college, society or publishing house.

COSMOPOLITAN. Having subscribers and contributors in every State in the Union, it is edited in the interest of *the whole profession*, not of one section or locality.

EMINENTLY PRACTICAL. Special prominence is given to Diagnosis and Therapeutics—the *recognition* and the *treatment* of disease, the real *business* of the professional man.

UNSURPASSED IN CHEAPNESS. When the *size* and *number* of its pages, and its frequency of issue are taken into account, it gives more matter for the money than any other medical journal in this country.

PARTICULARLY SUITED TO COUNTRY PHYSICIANS. It has always been a special aim of the editor to furnish a journal that would keep a reader remote from medical centres *fully up to the times* in his profession. Every surgical invention and new remedy of value, every medical book of moment, every professional discussion or news item of interest, will be found recorded in its pages. *Contributions* from country physicians are always welcome.

THE HALF-YEARLY COMPENDIUM

Appears on January 1st and July 1st of each year, forming two semi-annual volumes of 300 large octavo pages each, with complete Index. It has been established ten years, with a constantly growing circulation.

☞ While complete in itself, it is also intended as a **Companion Journal to the Medical and Surgical Reporter**; it is made up from articles *which have not been included* in the latter. The one journal is the Complement of the other.

From 600 to 700 separate articles appear each year in its various departments, carefully prepared, and giving the choicest selections from all sources, American and Foreign. It is the *only* work of the kind which does justice to *American* writers in medicine.

PRICES PER YEAR.

***The Weekly Medical and Surgical Reporter*.....$5.00**
***The Half-Yearly Compendium of Medical Science*..... 2.50**
***The Reporter and Compendium taken together*..... 7.00**

Payable in Advance.

DIFFERENTIAL DIAGNOSIS;

A MANUAL

OF THE

COMPARATIVE SEMEIOLOGY

OF THE MORE IMPORTANT DISEASES.

By F. DeHAVILLAND HALL, M.D.,

Assistant Physician to the Westminster Hospital, London.

American Edition, with Extensive Additions.

One Volume 8vo, pp. 205. Printed on handsome tinted paper; bound in English pebbled cloth, with beveled boards. Price, $2.00.

☞ **SENT BY MAIL, POST-PAID, ON RECEIPT OF THE PRICE.** ☜

Dr. HALL's work has received the highest encomiums from the English medical press, for its lucid arrangement, completeness, and accuracy. He himself is known in London as a practitioner of great skill, and an unusually successful medical teacher. His work has been considerably enlarged in this edition, the editor having devoted especial attention to (1) pointing out the *early* and often overlooked symptoms of disease (2), enumerating the *pathognomonic* symptoms, and (3) bringing into relief the *peculiar features* of diseases in this country.

Most of the diseases which may be confounded, are presented in comparative tables, setting forth their distinctive characteristics in the clearest possible light, and thus greatly facilitating their prompt diagnosis.

CONTENTS.

The contents follow, in a general way, the nomenclature of the College of Physicians; thus the work is divided into two parts, the one on General Diseases, the other on Local Diseases.

The First Part contains, among other matters—

The Symptoms of the Febrile State Defined.

Comparative Table of the Temperature and Pulse in the Leading Febrile Diseases.

Differences between Symptomatic and Essential Fever.

Tabular Comparison of Rötheln, Scarlet Fever, Measles, and Smallpox.

Comparison of the Symptoms of Typhoid and Typhus; of Typhoid and Malarial Fever; of Typhoid and Typho-Malarial; of Typhoid Fever and the Typhoid State; of Typhoid and Relapsing Fever.

Diagnosis between Epidemic and Sporadic Cerebro-spinal Meningitis; between Epidemic Meningitis and Typhus; between the Same and Congestive Malarial Fever.

The Signs of the Arthritic, the Scrofulous, the Syphilitic, and the Tubercular Dyscrasiæ.

Gout, Rheumatism, and their Allies.

The Second Part includes the Diagnosis of Local Diseases; embracing, for example—

The Differential Points between Hemorrhage, Thrombosis, and Embolism in the Brain; between the various forms of Solerosis, Syphilosis, Paralysis, and Ataxy of the Spinal Cord; and between Organic, Functional, Toxic, and Hysterical Paralyses. These extremely difficult problems in diagnosis are set forth with the utmost clearness.

Neuralgia and its Counterfeits (myalgia, spinal irritation, cerebral abscess, alcoholism, hysteria, etc).

Diagnostic Table of Acute, Chronic, Syphilitic, and Tubercular Laryngitis, Perichondritis, Benign and Malignant Growths, and Neuroses of the Larynx.

Distinctions between Inflammatory Croup and Spasmodic Croup, on the one hand, and Membranous Croup and Diphtheria, on the other.

Catarrhal as Distinct from Parenchymatous Tonsillitis.

Normal and Abnormal Chest Sounds (in all, eleven very carefully prepared tables).

Dr. John Hughes Bennett's General Rules for Diagnosing Heart and Lung Affections.

Comparison of the Three Forms of Phthisis.

The Diagnosis of Incipient Phthisis (sixteen different signs are given of its very earliest stage).

Differential Diagnoses between Incipient Phthisis and Bronchitis; between Acute Phthisis and Typhoid Fever; between Capillary Bronchitis and Pneumonia; between Pneumonia and Pleurisy; Pneumothorax and Pneumo-Hydrothorax, etc.

Dr. Dobell's Aphorisms on the Significance of Pain at and near the Heart; his Aphorisms on the Significance of Clubbing of the Finger Ends.

Diagnosis between the Various Cardiac, Aortic, and Mitral Diseases.

The Cheyne Stokes Respiration Discussed.

To Distinguish Acidity of the Stomach from Fermentation and from Hypersecretion; Stomachal Vertigo from Cerebral Vertigo; Gastric Vomiting from Cerebral Vomiting.

Comparative Symptoms of Atonic Dyspepsia, Chronic Gastritis, Gastric Ulcer, and Gastric Cancer.

Special Points in the Diagnosis of Gastric Cancer.

The Symptoms of Dyspepsia, by Murchison.

Abdominal Phthisis as Distinguished from Typhoid Fever.

Hutchinson on the Diagnosis of Intestinal Obstruction.

Comparison of Enteritis with Colitis.

The Diagnosis of Hepatic Diseases.

Hardy's Handy Tests for Bile in the Urine.

What Pain in the Liver may Signify.

What Jaundice may Signify.

Hepatic Diseases Classified with Regard to the Size of the Liver.

The Symptoms of Internal Parasites.

The Earliest Signs of Bright's Disease.

The Seven Forms of Bright's Disease Compared.

The Four Forms of Diabetes Compared.

The Kinds of Calculi and their Tests.

Besides numerous other diseases and tables not mentioned above.

STAUFFER'S

Anteversion C, Globe Top G, and Oblong H, in price the same as A, with similar attachments.

Retroversion E, on Belt X, $8.00; on XX, $10.00; on Y, $9.00; and on Z $7.00. Without Belt $6.00

Duplicate Cups—A, $2.00; E, $3.00; Globe Tops G, with attachments to screw on A or E stem $2.00.

P. S.—Shifting Top, with solid or no Spring Stem, 50 cents less on either belt. No Shifting Top Stem sold alone.

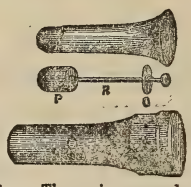
Self-Sustaining Globe B, or Cup D. $1.50 each.

Gums are mailed, 2 at 20 cts; 4 at 35 cts; and Springs at 3 cts. each.

Abdominal Supporters: 2. 3.

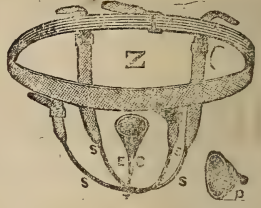
Price, $4.00. Price, $3.00.

SPECULUMS AND CASE. 6.



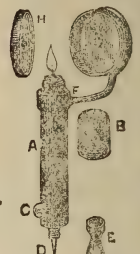
Prices.—The series encased, $14.00. With complete but non-shifting conductor, $2.50 each. Flesh color enameled inside.

SOLID STEM CUP SUPPORTER E. C. 5.



Price, $4.50. Including Cup D, $6.00. Or E C, on Abdominal Belt X, $5.50. X X, $7.50. Y, $6.50. Including D, on each, $1.50 extra.

REFLECTOR, OR DENTISTS' LIGHT. 10.

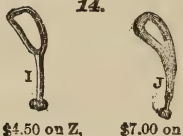


Price, $3.50.

Rectum Supporter and Ointment Holder. 4.

$3.50.

STEM LEVERS. 14.

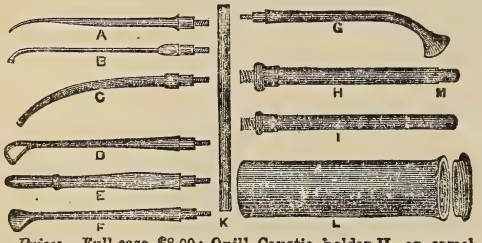


$4.50 on Z, $7.00 on X.

Permanent Stem I—The same in price as E C, Fig. 5, on all the belts.

Spring Stem J—The same as Spring Stem Cup A, Fig. 1, on either belt.

HARD RUBBER UTERINE EXAMINING CASE. 12.



Prices.—Full case, $8.00; Quill Caustic holder H, or camel hair brush holder and case I, each $1.00. Any two of the first seven, with centre piece K, $2.50.

Fenestrated Vaginal and Anal. 7.

Prices.—Vaginal T, $2.00. Anal U, $1.50.

Caustic Bottle and Case. 11.

Price, $1.50.

Hymen—Pointed. 8.

Price, $1.50.

Vaginal and Vulva Dilator. 9.

Price, $1.50.

15.

13.

Price, $1.00.

Supporters E. C. or Economy.—Fig 5, on its elastic belt Z, is the least in price, and by the oblique construction of the cup sets direct within the angle of the axis of the uterus and vagina. (well seen by IU. Fig 13.) If properly selected, or made so by the exchange privilege, (which admits the interchange of all the hard rubber parts in the catalogue, to cover the purchaser's risk.) It is warranted to correct and sustain even any *Procidentia.* The spring stems and shifting tops with their supplements, Fig. 1. Also, improved ***Retroversion, Cup E. Anteversion C.*** and ***Intra-Uterine Stem Cup, IU,*** Fig 13. The stem locks in a square socket after the cup is in position, and is supported on the elastic gums 8S, as A Fig 1, and same in price. Stem Levers, Fig. 14, etc. All are fully explained in the catalogue. The ***Series*** comprises upwards of 150 in style and size instruments, of which two thirds belong to the support and correction of the uterus. ***Speculums***—Thomas' objections p. 67—76, are by them completely overcome. The case contains four. The clear and large view, and facility to work through them, far exceeds any other. The ***Ex. Case,*** and physician's favorite, is admirably represented by Fig. 12—weight but 4 oz. ***Catalogue*** sent free on application. In addition to the description of the above series of instruments, it contains important information on this line of treatment.

L. REICH,

DIRECT IMPORTER OF THE

CHOICEST AND PUREST

Hungarian WINES

EVER BROUGHT TO THIS COUNTRY,

STRICTLY FOR MEDICINAL USE.

13 West 11th St., New York.

Mr. REICH will be pleased to see those of the Medical Profession who may desire to avail themselves of the opportunity of procuring **STRICTLY FIRST-CLASS WINES**, which have received the endorsement of the most eminent Medical men of the country, as is evidenced from the following letters of commendation which have been received:—

This is to certify, that I have examined Mr. L. REICH'S TOKAYER AUSBRUCH, TOKAYER MASLAS and BUDAI IMP. I take great pleasure in commending these Wines to the Medical Profession because of their purity.

R. OGDEN DOREMUS, M.D., LL.D.,
Prof. of Chem. and Toxicology in Bellevue Hosp. Med. Col., and Prof. of Chem. and Physics in Col. City of New York.

We have used in our practice the Hungarian Wines sold by Mr. LORENZ REICH, who puts them on the market unadulterated, just as they are imported. To this fact we attribute their great value as a medicine in diseases where such tonics are indicated, especially in those which are attended by defective digestion and imperfect assimilation. We cordially recommend Mr. REICH and his Wines to our professional brethren.

THE MEDICAL REGISTER AND DIRECTORY

OF THE

UNITED STATES,

SYSTEMATICALLY ARRANGED BY STATES:

COMPRISING

NAMES, POST-OFFICE ADDRESS, EDUCATIONAL AND PROFESSIONAL STATISTICS, OF MORE THAN 60,000 PHYSICIANS, WITH LISTS OF MEDICAL SOCIETIES, COLLEGES, HOSPITALS, AND OTHER MEDICAL INSTITUTIONS, WITH ABSTRACTS, OF THE MEDICAL LAWS OF EACH STATE, NOTES OF MINERAL SPRINGS Etc.

BY

SAMUEL W. BUTLER, M. D.

SECOND EDITION, REVISED AND CORRECTED.

One Volume, large octavo, double columns, 874 pages. Price, Cloth, $5 50; Leather, $6.50.

The **SECOND EDITION** of this important work has been prepared at great cost of time and money. The lists have been carefully revised *by leading men in each State.* Nearly TEN THOUSAND new names have been added, and numerous corrections made. Those who have purchased the first edition will find this one to possess *all the value of a new work.*

This work has a *national* and *historic* value, as well as a present *business* one. Besides the names and addresses of all the physicians in the country, it contains the roster of the medical officers in the Army and Navy, list of the officers of State and County medical societies, a sketch of the medical geography of each State and Territory, analysis of the waters of all prominent mineral springs, and a mass of other information interesting to the profession. The collation of the *laws regulating the practice of medicine* in the various States is a feature of special interest and one not to be found in any other publication.

All who desire to reach medical men for business purposes, for instance, Life Insurance Companies, Medical Colleges, Wholesale Druggists, Importers and Manufacturers of Pharmaceutical Specialties, Dealers in Surgical Instruments, will find this book invaluable.

OPINIONS OF THE PRESS.

From the (London) *Lancet:*
This is the first work of the kind that has ever appeared on the other side of the Atlantic. The Editor and Compiler, Dr. S. W. Butler, and the publisher, are to be congratulated upon an undoubted success.

From the (London) *Medical Press and Circular:*
Upon opening its well-filled and well arranged pages our only surprise is that such a go-ahead race as our cousins have the credit of being, should have gone on so long without so valuable a book of reference.

From the (Philadelphia) *Medical Times:*
To publishers, druggists and those members of the profession whose sympathies and needs are wide enough to reach beyond their own immediate neighborhood, this book must be invaluable.

From the (Cincinnati) *Lancet and Observer:*
Of very great value, and will be to physicians what the city directory is to the man of business, a book he cannot get along very well without.

From the *Medical and Surgical Reporter:*
A volume of very considerable importance, the appreciation of which must grow in time, and it should find a place in every medical library of any pretensions of completeness.

Published by D. G. BRINTON,

115 South Seventh Street, Philadelphia.

SCOTT'S EMULSION

PURE COD LIVER OIL

WITH

HYPOPHOSPHITES OF LIME AND SODA

PERFECT, PERMANENT, PALATABLE.

We respectfully ask the Medical Profession to give the above preparation a trial, knowing they will find it just the thing long desired, and obtain splendid results in the wasting diseases indicated by malnutrition and assimilation. The *perfect* and *permanent* union of the Cod Liver Oil with the Hypophosphites, and the thorough manner in which the nauseous taste is disguised, renders it so palatable that the most delicate stomach can retain it. The notable advantage it possesses over all other preparations, is its *permanency* as an *emulsion*, remaining for an almost unlimited time without the slightest separation or change, which enables the Physician always to prescribe it in its proper proportions. The oil is prepared expressly for us, and guaranteed strictly pure. We will gladly furnish, express paid, a 4-oz. sample to any Physician in the country who may not have been supplied.

Formula.—50 per cent. of pure Cod Liver Oil, 6 grs. of the Hypophosphite of Lime, and 3 grs. of the Hypophosphite of Soda to a fluid ounce.

SCOTT & BOWNE,
Manufacturing Chemists, 125 Hudson Street, N. Y.

Messrs. SCOTT & BOWNE: NEW YORK, September 4, 1876

Gents—I have prescribed Scott's Emulsion of Cod Liver Oil with Hypophosphites in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather, and is more palatable than any other preparation of oil that I have used. Yours, very respectfully,

ROBERT WATTS, M.D., President Medical Board, Charity Hospital.

Messrs. SCOTT & BOWNE:

Gentlemen—Having given your Emulsion of Cod Liver Oil and Hypophosphites of Lime and Soda a fair trial during the past eighteen months, am very much pleased with the same, and consider it the best preparation of the kind in the market.

Yours, truly, J. H. HARTMAN, M.D., Baltimore, Md.

We also refer to the following Physicians, who use it and recommend it to the Profession:

G. C. SHATTUCK, M.D., 18 Stamford Street (Late Visiting Physician, Mass. General Hospital).
J. AYER, M.D., No. 6 Hancock Street, Boston.
G. W. GAY, M.D., 575 Tremont Street (Visiting Surgeon Boston City Hospital).
F. E. BUNDY, M.D., 99 Waltham Street, Boston.
W. B. MACKIE, M.D., 675 Tremont Street, Boston.
J. A. OCTERLONY, M.D., Louisville, Ky.
J. SIMONAUD, M.D., New Orleans.
G. LANE TANEYHILL, M.D., Baltimore.
EDWARD A. MARIS, M.D., Baltimore.

TO PHYSICIANS.

—:o:—

In order to facilitate the introduction of the metric system, as well as to furnish a convenient posological table, we have published a Visiting List Dose Book, in which the doses are given both in the metric and in the apothecaries weights and measures. It is light, and neatly bound in flexible silk covers, so that it may be carried in the visiting list or pocket, without inconvenience. This little book renders the use of the metric system easy and attractive, even to old practitioners. All physicians interested in the advancement of our science are urged to aid us in placing this little book in the hands of the profession, not only by sending for it themselves, but by ordering it for their friends. Sent free on receipt of six cents in postage.

DEXTRO-QUININE.

Equal to Sulphate of Quinine in the same dose—causes in large doses no cerebral distress nor irritability of the stomach—less than one-half as costly as Sulphate of Quinine.

From recent letters recording CLINICAL EVIDENCE OF THE VALUE OF DEXTRO-QUININE, we extract the following:

Mrs. S., æt. 22, married, no children, brunette, suffering from intermittent fever, first paroxysm Nov. 20th, 6 A.M., again at 4 P.M. Prescribed Cinchonidia sulphate, grs. XXX, chart No. V. One to be taken every two hours.

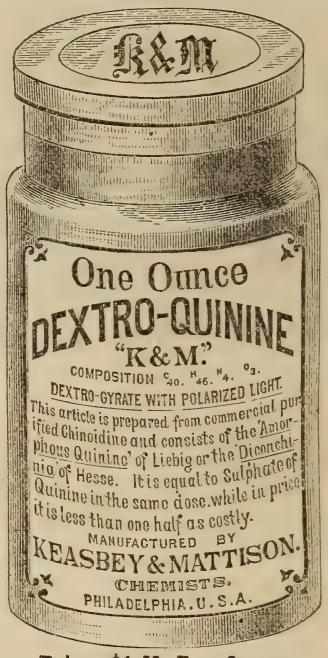
Nov. 21st. Return of paroxysm at 6 A.M. and 4 P.M. Gave Cinchonidia sulphate, grs. XLV, chart No. V. One to be taken every two hours.

Nov. 23d. Return of paroxysm at same time as on preceding days. Prescribed Dextro-Quinine, grs. XX, chart No. V. One to be taken every two hours. No return of chill since that date, and highly pleased with my experience.

N. H. MANRING, M. D.,
Rigdon, Ind.

Dec. 13th. I have used Dextro-Quinine in two cases of malarial fever complicated with so much irritability of the stomach that Quinine or Cinchonidia could not be given. The Dextro-Quinine was well tolerated by the stomach, and acted precisely like Quinine when given in the same doses.

WM. COMMONS, M. D.,
Union City, Ind.



K&M
One Ounce
DEXTRO-QUININE
"K&M."
COMPOSITION C_{40}. H_{46}. N_4. O_3.
DEXTRO-GYRATE WITH POLARIZED LIGHT.
This article is prepared from commercial purified Chinoidine and consists of the 'Amorphous Quinine' of Liebig or the Diconchinia of Hesse. It is equal to Sulphate of Quinine in the same dose, while in price it is less than one half as costly.
MANUFACTURED BY
KEASBEY & MATTISON.
CHEMISTS,
PHILADELPHIA, U.S.A.

Price, $1.50 Per Ounce.

Dec 13th. I am using in the cases of typhoid fever under my charge, your Dextro-Quinine as a substitute for Sulphate of Quinine, in the same doses, and meet with the same effect. I think it an article of *genuine merit.*

D. E. WELLS, M. D.,
Bethlehem, N. H.

Nov. 29th. After using Dextro-Quinine in cases of ague, I deem it equally good, if not preferable to the Quinine Sulphate. Please give me the names of Druggists in St. Louis or Chicago, of whom I can get it.

C. J. RAGLAND, M. D.,
Mulberry Grove, Ill.

Dec. 14th. I have given Dextro-Quinine in two cases of Tertian ague, with the result of promptly arresting the chills. It caused no unpleasant "head symptoms" in either case. The doses were the same as ordinary doses of Quinine. H. A. RODEBAUGH, M. D., Reynoldsburg, O.

Dec. 12th. I find your Dextro-Quinine well tolerated by the stomach, and produces no distress. I think it has the advantage of Sulphate of Quinine in not producing headache and other disagreeable symptoms. L. NEWCOMB, M. D., N. Scituate, Mass.

Dec. 12th. I think the success attending my administration of your Dextro-Quinine in cases of remittent fever justifies me in saying better results could not be obtained with Sulphate of Quinine itself. It has the advantage of Quinine in not affecting the head and being less disagreeable to the palate. JOS. MULLANE, M. D., Lyons, Ind.

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION, CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines, without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris; notably Drs. BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success.

Prepared by **E. GRILLON,** Pharmacien de 1ère classe, 27 Rue Rambuteau, Paris. To be had of all respectable Chemists throughout the world.

PEPTODYN.

The New Digestive is a combination of the whole of the Digestive Secretions—Pepsine, Pancreatine, Diastase, etc.,

Forming an invaluable remedy in the treatment of all forms of Dyspepsia, and diseases arising from imperfect nutrition.

N. B.—*The success of this Remedy has led to several imitations of it,* which consist largely of Milk Sugar, and, as compared with Peptodyn, are of little or no real value as digestive agents.

SAVORY & MOORE, 143 New Bond Street, London.

PARIS, 1867. Prize Medal.

1872. Gold Medal.

1873, VIENNA. Medal of Merit.

BOUDAULT'S PEPSINE

IN POWDER, also WINE, ELIXIR, SYRUP, PILLS, AND LOZENGES OF PEPSINE.

Since the introduction of Pepsine by Boudault in 1854, **BOUDAULT'S PEPSINE HAS BEEN, AND IS STILL CONSIDERED, THE MOST RELIABLE,** as is attested by the awards it has received at the Exhibitions of 1867, 1868, 1872, 1873, and in 1876 at the Centennial Exposition in Philadelphia.

IT IS THE ONLY PEPSINE USED IN THE PARIS HOSPITALS.

Careful tests will enable any one to satisfy himself that **BOUDAULT'S PEPSINE HAS A DIGESTIVE POWER AT LEAST DOUBLE** that of the best Pepsines in the market, and that it is really the cheapest.

It is Sold in 1 ounce, 8 ounce, and 16 ounce Bottles.

Beware of so-called French Pepsines bearing fictitious names, and prescribe Boudault's only.

BLANCARD'S PILLS

OF UNCHANGEABLE IODIDE OF IRON.

Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired a so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of

Blancard

Pharmacien, No. 40 Rue Bonaparte, Paris.
without which none are genuine.

BEWARE OF IMITATIONS.

PHOSPHOROLE.

PHOSPHORUS and COD-LIVER OIL

have now an established position throughout the civilized world as important therapeutical agents. A *perfect combination* of the two has long been a desideratum, since they are both of value in the same disorders, while the cases in which one is demanded and the other contra-indicated are exceedingly rare.

The combination in PHOSPHOROLE has the twofold advantage of furnishing *the best possible form* for the administration of *phosphorus*, and *a more effective form* for the administration of *cod-liver oil*.

With regard to the former, it has been decided by the highest chemical and medical authorities that *phosphorus* should be administered *in a free state*, and in a vehicle which ensures its *perfect diffusion*, its *absolute unalterability*, and, as far as possible, its *prompt assimilation* without the gastric irritation to which the ordinary methods of exhibiting the agent give rise. It is well known that pills, emulsions, solutions in ether, chloroform, vegetable oils and resin, etc., have all failed to fulfill one or more of these conditions. Even an ordinary solution of phosphorus in cod-liver oil would not answer the purpose in all respects. We claim, however, that PHOSPHOROLE completely satisfies all the conditions. From the method of preparing it, in an atmosphere of dry carbonic acid, the phosphorus is *entirely dissolved without oxidation*, and by our mode of manipulation *a positive uniformity of strength* is ensured. It is then promptly bottled and sealed, and its *stability and permanence* thus secured. The exact amount of phosphorus in each dose is known, its efficiency is ensured, and the irritant effects upon the stomach are reduced to a minimum by the blandness of the oil. As a means then of administering *phosphorus* in the many cases in which it is indicated as a *nervous tonic and stimulant*, it is claimed that PHOSPHOROLE is the best attainable in the present state of our knowledge.

The value of *cod-liver oil* in phthisis is so familiar to the physician that it is needless to dwell upon it. But the value of *phosphorus* is also universally recognized in this disease, especially when complicated with nervous derangements. The *combination* of the two therefore furnishes a more effective form for the administration of cod-liver oil in the great majority of cases in which that remedy is indicated, and one which will at once commend itself to the profession.

A dose of two teaspoonfuls of PHOSPHOROLE contains $\frac{1}{100}$ of a grain of phosphorus. This dose, when given after a meal, is effective, and not very liable to interfere with digestion. *Phosphorus is cumulative in its action, and should be administered with watchful care.* About $\frac{1}{12}$ grain is considered the largest safe dose, and we rarely need go higher than $\frac{1}{20}$ or $\frac{1}{30}$ of a grain. At the very first appearance of the smallest gastric derangement, the exhibition of phosphorus should be stopped.

PHOSPHOROLE is handsomely put up in pint bottles only, and may be obtained at all first-class druggists throughout the United States.

Descriptive Circulars furnished upon application.

BILLINGS, CLAPP & CO.,

MANUFACTURING CHEMISTS, BOSTON.

SOLUTION
FERROUS CHLORIDE.

This Solution of Iron is the lowest form of Chloride. It is much less styptic in taste than Tr. Iron Chloride, consequently pleasanter to the patient; it is much more easily assimilated by weak and irritable stomachs.

Knowing how difficult it is to introduce into the blood, in a proper form, a sufficient quantity of iron to be beneficial, we have manufactured and introduce the **Ferrous Chloride** as being easily absorbed and acting with much efficacy, even when given in small doses.

Dr. Rabuteau, who has specially studied the protochloride of iron, and shown that it is the most natural of ferruginous salts, thinks that he has found the very thing required:—

EXTRACT FROM THE REPORTS OF THE ACADEMY OF SCIENCES OF PARIS.
(*Sitting of* 11 *December*, 1871.)

"..... The most important thing is the facility with which the protochloride of iron is absorbed by the stomach. Two or three hours after from 4 to 10 grains of this salt have been ingested, almost the whole is absorbed. Having finally observed that the reduced iron and the ferruginous oxyds and carbonates are changed into protochloride in the stomach by the contact with the hydrochloric acid of the gastric juice, I thought it necessary to substitute this salt for all the preceding for medicinal purposes. My observations in the wards of hospitals and in my own practice have convinced me of the successful results of the protochloride of iron, which is easily borne when pure and administered in a proper way."

For details, see the memoirs on the protochloride of iron published in the *Union Médicale, Paris*, 1871 and 1872.

Each fluid drachm contains two grains of the Anhydrous **Ferrous Chloride.**

APOLLINARIS
NATURAL MINERAL WATER.
HIGHLY EFFERVESCENT.

Approved by the Academy of Medicine of France, and its sale in France authorized by special decree of the French Government.

"THE QUEEN OF TABLE WATERS."—*London Medical Record.*

PROFESSOR OSCAR LIEBREICH, Professor of Medical Chemistry, University of Berlin:—"After minute personal investigation, I can affirm that the Apollinaris Water is bottled according to all the rules of science, and is an entirely Natural Mineral Water."

PROFESSOR J. A. WANKLYN, Lecturer on Chemistry, St. George's Hospital, London:—"I have thoroughly examined the Apollinaris Spring and the method of bottling. The Apollinaris Water, as supplied to the public, is simply and purely a Natural Mineral water, impregnated only with its own gas."

PROFESSOR MOHR, Medical Councilor, University of Bonn:—"After exhaustive investigation, I declare the Apollinaris Water, as supplied to the public, to be purely natural in every respect, and of most excellent quality."

DR. THEODOR KYLL, Analytical Chemist, Town Councilor, Cologne (*expert appointed by United States Vice-Consul, October*, 1877), reported that "The Apollinaris Water, as bottled, deserves in every respect the name of an excellent natural acidulated water."

Every Genuine Bottle bears the REGISTERED YELLOW PICTORIAL LABEL of the Apollinaris Company, Limited, London.

To be had of all Wine Merchants, Grocers, Druggists, and Mineral Water Dealers throughout the United States, and Wholesale of

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION,

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil, by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM, instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat, in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion may therefore be regarded as Chyle obtained by nature's own process. In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more stable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatized Cod-Liver Oil, the active digestive principle of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Pancreatine effects the digestion and assimilation of Cod-Liver Oil and Fat, as well as Food generally. This palatable and popular remedy is therefore invaluable to PATIENTS WHO ARE UNABLE TO DIGEST COD-LIVER OIL, and who are thus deprived of its nourishing and invigorating properties.

Pancreatine Wine. An excellent vehicle for taking Cod-Liver Oil and promoting the digestion of it.

TO THE MEDICAL PROFESSION.

LACTOPEPTINE,

The most important remedial agent ever presented to the Profession for Indigestion, Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all diseases arising from Imperfect Nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase, or Veg. Ptyalin, Lactic and Hydrochloric Acids, in Combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk.....40 ounces.	Veg. Ptyalin or Diastase.....4 drachms.
Pepsin..... 8 ounces.	Lactic Acid.....5 fl. drachms.
Pancreatine ..... 6 ounces.	Hydrochloric Acid.....5 fl. drachms.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its almost universal adoption by the Profession is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned having tested LACTOPEPTINE, recommend it to the Profession:—

ALFRED L.-LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine, University of the City of New York.

LEWIS A. SAYRE, M.D.,
Professor of Orthopædic Surgery and Clinical Surgery, Bellevue Hospital Medical College.

F. LE ROY SATTERLEE, M.D., PH.D.,
Professor of Chem., Mat. Med. and Therap. in the N. Y. College of Dent.; Prof. of Chem. and Hygiene in the Am. Vet. College, etc., etc.

SAMUEL R. PERCY, M.D.,
Professor Materia Medica, New York Medical College.

A. VAN DEVEER, M.D.,
ALBANY, N. Y., June 8th, 1878.
Prof. of the Prin. and Prac. of Surg., Albany Med. Col.; Surg. Albany and St. Peter's Hospitals.
"I have given LACTOPEPTINE a good thorough trial, and have been greatly pleased with the excellent results that have followed its administration."

JOHN H. PACKARD, M.D.,
PHILADELPHIA, PA., May 30th, 1878.
Pres't Phila. Co. Obstet. Society; Surg. Episcopal and Women's Hospitals
"I have found great satisfaction in the use of LACTOPEPTINE, and have ordered it frequently in cases of Dyspepsia, especially where there is want of tone and defective secretion."

JAS. AITKEN MEIGS, M.D.,
PHILADELPHIA, June 20th, 1878.
Prof. of the Institutes of Med. and Med. Juris., Jeff. Medical College; Phy. to Penn. Hos.
"I have used LACTOPEPTINE with very good effect in a number of cases of Dyspepsia."

W. W. DAWSON, M.D.,
CINCINNATI, O., June 21st, 1878.
Prof. Prin. and Prac. Surg., Med. Col. of Ohio; Surg. to Good Samaritan Hospital.
"I have used LACTOPEPTINE with great advantage in cases of feeble digestion."

ALBERT F. A. KING, M.D.,
WASHINGTON, D. C., June 19th, 1878.
Prof. of Obstetrics, University of Vermont.
"I have used LACTOPEPTINE both in hospital and private practice, and have found it to answer fully the purposes for which it is recommended. As an immediate aid to the digestive function, I know of no remedy which acts more directly."

D. W. YANDELL, M.D.,
LOUISVILLE, KY., March 7th, 1878.
Prof. of the Science and Art of Surg. and Clinical Surg., University of Louisville.
"I have made much use of LACTOPEPTINE, and take great pleasure in stating that it has rarely disappointed me. I shall, of course, continue to prescribe it."

ROBT. BATTEY, M.D.,
ROME, GA., June 8th, 1878.
Emeritus Prof. of Obstetrics, Atlanta Med. College, and Ex-Pres. Med. Association of Ga.
"I have used LACTOPEPTINE in a case of Dyspepsia with satisfaction. I think well of it."

CLAUDE H. MASTIN, M.D., LL.D.,
MOBILE, ALA., June 8th, 1878.
"I consider LACTOPEPTINE the very best preparation of the kind which I have ever employed, and for patients with feeble digestion I know of nothing that is equal to it."

Prof. H. C. BARTLETT, PH.D., F.C.S.,
LONDON, ENG., February 22d, 1876.
"I find the preparation of LACTOPEPTINE contains within itself all the principles required to promote a healthy digestion.

PRICE LIST.

SPECIAL FACTS CONCERNING

BELLADONNA PLASTER

IN RUBBER COMBINATION.

PREPARED BY

SEABURY & JOHNSON.

In undertaking the manufacture of Medicinal Plasters we had but one object in view—THE IMPROVEMENT OF ALL KINDS OF PLASTERS. Among the various plasters manufactured by us was BELLADONNA PLASTER. This article met with a larger demand than some of the others, acquired a reputation among the best druggists, and received the confidence of the profession. Its large sale interfered with rival manufacturers, and continuous efforts have been made on their part to prejudice physicians against it.

As these attacks have been of late more malicious than usual, we have deemed it advisable, in self-defence, and in order to place our article fairly before the practitioner, to assign reasons why we consider it the most thoroughly reliable preparation ever offered the medical profession. First, it is a combination of the Alcoholic Extract of Belladonna only, with purified rubber, and thus possesses all of the advantages of the rubber base, being pliable, convenient of application, and not subject to the deteriorating influence of age, as is the case when any other base is used. Secondly, it is freed from all irritative properties. Thirdly, it is more adhesive than any other plasters. Fourthly, we believe it to be as perfect in every respect as it is possible to make a Belladonna Plaster.

ENGLISH EXTRACTS—WHY WE DO NOT EMPLOY THEM.

Imported English Extracts are prepared from the Inspissated Juice of the leaf, whilst our pharmacopœia formula is treated by Alcohol. The active principle of Belladonna (Atropia) is only partially obtained by Inspissation. The employment of Alcoholic or Hydro-Alcoholic Solvents completely exhausts the entire strength of the drug.

The value of both preparations is clearly presented in an able treatise published in the *American Journal of Pharmacy*, April 1876, page 145. Our own investigations are substantially identical:—

TABLE OF RESULTS.

	Test solution requisite for 100 c. c. of Ext. Solution.	Percentage of Atropia in Extract.
EXT. BELLADONNÆ ALCOH. U. S. P.	*17·732*	*2·571*
GEO. ALLEN & CO., English	*9·73*	*1·411*
*HERRINGS & CO., " *	*8·133*	*1·179*
E. MERCK, Germany (aqueous extract), made 1869	*1·9*	*·275*

This analysis clearly establishes the fact that the **Alcoholic Extract of Belladonna of the U. S. P. averages over twice the strength of English Extracts,** and should, therefore, be preferred in all cases where a reliable article is desired. Inspissated and Aqueous Extracts deteriorate, while Alcoholic remain stable.

Therefore the assumption of pretentious manufacturers that the English Extracts are the superior preparations, must be based on a former supposition rather than present facts. The following analysis substantiates our claim regarding English Extracts.

ANALYSIS OF BELLADONNA PLASTERS, BY PROF. R. OGDEN DOREMUS.

"BELLEVUE HOSPITAL COLLEGE, New York, Sept. 7, 1878.

"GENTLEMEN—I obtained from Messrs. W. H. Schieffelin & Co., of this city, samples of Belladonna Plasters prepared by Grosvenor & Richards, Boston; Mitchell Novelty Plaster Works; Seabury & Johnson, New York and London. I have examined these varieties for the purpose of determining which possesses the largest quantity of Atropine. I employed equal surfaces of each, and *my analysis demonstrated that* SEABURY & JOHNSON'S *contains the greatest proportion* of the active principle of Belladonna.

"R. OGDEN DOREMUS, M.D., LL.D."

Belladonna Plaster, prepared by Seabury & Johnson, is packed in elegant tin cases, which contain 1 yard each, and can be obtained of almost any druggist throughout the United States and Canada, or will be furnished direct by mail. Samples sent on application.

SEABURY & JOHNSON,

Manufacturers of Medicinal and Surgical Plasters, in Rubber Combination,

ALWAYS SPECIFY SEABURY & JOHNSON'S PLASTERS.

NEW HYPODERMIC SYRINGES.

FIG. 48.—NO. 2.

These cuts (two-thirds the actual size) represent a New Hypodermic Syringe of our Manufacture. With the exception of the needles, it is of German Silver, a material chosen as possessing, next to steel, the greatest rigidity and durability, while free from liability to oxydation. The barrel is formed by a process peculiar to ourselves, securing uniformity of calibre without soldered joint or seam. It is plated inside and outside with nickel. The piston is packed in the double parachute form, with leather prepared expressly for the purpose. It will be found to retain its elasticity, to operate smoothly, to resist all tendency of fluid to pass above, as of air below it. A nicely-engraved scale upon the piston-rod indicates minims, thirty being the capacity of the syringe.

Syringes Nos. 2, 3, and 4 have also a screw thread upon the piston-rod, and a traverse nut, thereby favoring the utmost nicety in the graduation of doses.

No. 3, Compact, has hollow piston-rod to receive one needle, also a protecting cover and fluid retainer; it may be carried in the Pocket Instrument or Vial Case, or without any case.

No. 4, Compact, is like No. 3, with the addition of a second needle, carried upon the syringe in the usual place, protected by a metal shield.

Nos. 1 and 2 are put up in neat morocco-covered case, with vial.

Two sizes of needles are furnished with each instrument, Nos. 1, 2, and 4; one only with No. 3. They are of refined steel, carefully tempered, and thoroughly plated with gold; they are of small diameter and large relative calibre, sharpened to such an angle as will offer least resistance to penetration, and therefore cause least pain. At the point of union with the socket they are reinforced with an outer covering of German silver, thereby overcoming the tendency to become broken at this place. They are connected with the barrels by a screw thread.

Prices: No. 1, *$3 50* No. 2, *$4.00* Postage, .03
" No. 3, *2.50* No. 4, *3.50* " .02

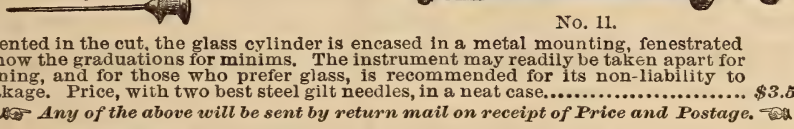
No. 3.

These Syringes are so thoroughly and strongly made as to be free from the annoying accidents common to most Hypodermic Syringes; and we believe that, for convenience, durability, and nicety of construction, they have no superior.

OTHER HYPODERMIC SYRINGES.

		Postage.
No. 7, glass-barrel, graduation engraved on barrel, with screw nut on piston, nickel-plated mountings, two best steel gilt needles, in neat case	*$3.00*	.02
No. 9, glass, graduation engraved and numbered on piston-rod, with screw nut, best steel gilt needles, in neat case	*3.00*	.02
No. 7 or No. 9, with two steel unplated needles, either	*2.50*	.02
No. 10, glass, Luer's (French), graduation as No. 9, one gold needle and two steel needles, silver mountings, neat velvet-lined morocco case	*12.00*	.02

No. 11, glass cylinder, fenestrated, nickel-plated metal mounting (see cut).



No. 11.

As represented in the cut, the glass cylinder is encased in a metal mounting, fenestrated to show the graduations for minims. The instrument may readily be taken apart for cleaning, and for those who prefer glass, is recommended for its non-liability to breakage. Price, with two best steel gilt needles, in a neat case ..... *$3.50* Postage. .02

☞ *Any of the above will be sent by return mail on receipt of Price and Postage.* ☜

HYPODERMIC SYRINGES OF ALL KINDS PROMPTLY REPAIRED.

Our new *Illustrated Catalogue of Surgical Instruments,* also a new Pamphlet on Inhalation of Atomized Liquids, by distinguished medical authority, with many valuable formulas, will be forwarded, postpaid, on application.

Atomizers and articles for Antiseptic Surgery, Aspirators, Clinical Thermometers, Elastic Hose, Electrical Instruments, Invalids' Articles, Manikins, Models, Ophthalmoscopes; Dr. Paquelin's Thermo-Cautery; Pessaries, Rubber Urinals; Sayre's Splints, and Apparatus for every kind of Deformity; Skeletons, Sphygmographs, Splints, Transfusion Apparatus; Vaccine Virus from our own stables; Veterinary Instruments; Waldenburg's Pneumatic Apparatus, &c., &c.

CODMAN & SHURTLEFF,

Makers and Importers of Superior Surgical Instruments,

1140-1191eow **13 & 15 TREMONT STREET, BOSTON, MASS.**

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt. and all its combinations.

Extract of Malt,

WITH COD-LIVER OIL,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO,

(See Transactions of American Medical Association, for 1876, page 176.)

Is presented to the medical profession as an efficient, palatable and very stable combination, consisting of equal parts of the ***Extract of Canadian Barley Malt*** and the best quality of genuine ***Norwegian Cod-liver Oil.*** Many patients take this preparation who cannot take the oil in any other form. It may be employed in all cases where Cod-liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

Extract of Malt,

WITH COD-LIVER OIL AND PHOSPHORUS,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod-liver Oil, Phosphorus being added in the proportion of $\frac{1}{100}$ grain to the dose, and so combined as to be perfectly protected from oxidation. The ***Trommer Extract of Malt Company*** prepare this combination agreeably to the suggestion of ***Dr. Wilson Fox.*** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

Extract of Malt,

WITH COD-LIVER OIL AND IODIDE OF IRON

added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod-liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians, referring to it in terms of high praise.

1879. BEGIN NOW! 1879.

UNEQUALED INDUCEMENTS!

NEW SUBSCRIBERS WILL RECEIVE

THE WEEKLY

MEDICAL AND SURGICAL REPORTER

From October, 1878 until December 31st, 1879,

FOR $5.00!

The MEDICAL AND SURGICAL REPORTER has been established over thirty years, and has, it is believed, a *bonâ fide* subscription list, unsurpassed by any medical weekly in America.

It is issued every Saturday, neatly cut and bound, and gives 24 large octavo, double-columned pages of reading matter in each number. It claims the following

SPECIAL FEATURES.

IT IS INDEPENDENT, being controlled by no clique, college, society or publishing house.

COSMOPOLITAN. Having subscribers and contributors in every State in the Union, it is edited in the interest of *the whole profession*, not of one section or locality.

EMINENTLY PRACTICAL. Special prominence is given to Diagnosis and Therapeutics—the *recognition* and the *treatment* of disease, the real *business* of the professional man.

UNSURPASSED IN CHEAPNESS. When the *size* and *number* of its pages, and its frequency of issue are taken into account, it gives more matter for the money than any other medical journal in this country.

PARTICULARLY SUITED TO COUNTRY PHYSICIANS. It has always been a special aim of the editor to furnish a journal that would keep a reader remote from medical centres *fully up to the times* in his profession. Every surgical invention and new remedy of value, every medical book of moment, every professional discussion or news item of interest, will be found recorded in its pages. *Contributions* from country physicians are always welcome.

THE HALF-YEARLY COMPENDIUM

Appears on January 1st and July 1st of each year, forming two semi-annual volumes of 300 large octavo pages each, with complete Index. It has been established ten years, with a constantly growing circulation.

☞ While complete in itself, it is also intended as a **Companion Journal to the Medical and Surgical Reporter**; it is made up from articles *which have not been included* in the latter. The one journal is the Complement of the other.

From 600 to 700 separate articles appear each year in its various departments, carefully prepared, and giving the choicest selections from all sources, American and Foreign. It is the *only* work of the kind which does justice to *American* writers in medicine.

PRICES PER YEAR.

The Weekly Medical and Surgical Reporter.....$5.00
The Half-Yearly Compendium of Medical Science..... 2.50
The Reporter and Compendium taken together..... 7.00

Payable in Advance.

SCOTT'S EMULSION

PURE COD LIVER OIL

WITH

HYPOPHOSPHITES OF LIME AND SODA

PERFECT, PERMANENT, PALATABLE.

We respectfully ask the Medical Profession to give the above preparation a trial, knowing they will find it just the thing long desired, and obtain splendid results in the wasting diseases indicated by malnutrition and assimilation. The *perfect* and *permanent* union of the Cod Liver Oil with the Hypophosphites, and the thorough manner in which the nauseous taste is disguised, renders it so palatable that the most delicate stomach can retain it. The notable advantage it possesses over all other preparations, is its *permanency* as an *emulsion*, remaining for an almost unlimited time without the slightest separation or change, which enables the Physician always to prescribe it in its proper proportions. The oil is prepared expressly for us, and guaranteed strictly pure. We will gladly furnish, express paid, a 4-oz. sample to any Physician in the country who may not have been supplied.

Formula.—50 per cent. of pure Cod Liver Oil, 6 grs. of the Hypophosphite of Lime, and 3 grs. of the Hypophosphite of Soda to a fluid ounce.

SCOTT & BOWNE,
Manufacturing Chemists, 125 Hudson Street, N. Y.

Messrs. Scott & Bowne: New York, September 4, 1876.

Gents—I have prescribed Scott's Emulsion of Cod Liver Oil with Hypophosphites in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather, and is more palatable than any other preparation of oil that I have used. Yours, very respectfully,
ROBERT WATTS, M.D., President Medical Board, Charity Hospital.

Messrs. Scott & Bowne:

Gentlemen—Having given your Emulsion of Cod Liver Oil and Hypophosphites of Lime and Soda a fair trial during the past eighteen months, am very much pleased with the same, and consider it the best preparation of the kind in the market.
Yours, truly, J. H. HARTMAN, M.D., Baltimore, Md.

We also refer to the following Physicians, who use it and recommend it to the Profession:

G. C. SHATTUCK, M.D., 18 Stamford Street (Late Visiting Physician, Mass. General Hospital).
J. AYER, M.D., No. 6 Hancock Street, Boston.
G. W. GAY, M.D., 575 Tremont Street (Visiting Surgeon Boston City Hospital).
F. E. BUNDY, M.D., 99 Waltham Street, Boston.
W. B. MACKIE, M.D., 675 Tremont Street, Boston.
J. A. OCTERLONY, M.D., Louisville, Ky.
J. SIMONAUD, M.D., New Orleans.
G. LANE TANEYHILL, M.D., Baltimore.
EDWARD A. MARIS, M.D., Baltimore.

It has an able Corps of Contributors; Gives a Condensed Statement of the Progress of Medicine and Surgery; Reviews the Latest Medical Works; Publishes Society Proceedings, and keeps its Readers informed of the Medical News of the Day.

THE CINCINNATI LANCET AND CLINIC is issued *every Saturday*, and contains 20 large octavo double-columned pages of reading matter in every number, and is handsomely printed on fine tinted book paper, neither labor nor expense being spared to adapt it to the daily wants of the American practitioner of Medicine.

THE LANCET AND CLINIC is strictly an independent journal, not being controlled or published in the special interest of any College or Society, but is devoted to the advancement of science and progress of rational Medicine.

SPECIAL INDUCEMENTS.

NEW SUBSCRIBERS, who remit their names and subscription AT ONCE, will receive THE LANCET AND CLINIC from NOW until December 31, 1879,

FOR $3.50.

THE MEDICAL REGISTER AND DIRECTORY

OF THE

UNITED STATES,

SYSTEMATICALLY ARRANGED BY STATES:

COMPRISING

NAMES, POST-OFFICE ADDRESS, EDUCATIONAL AND PROFESSIONAL STATISTICS, OF MORE THAN 60,000 PHYSICIANS, WITH LISTS OF MEDICAL SOCIETIES, COLLEGES, HOSPITALS, AND OTHER MEDICAL INSTITUTIONS, WITH ABSTRACTS, OF THE MEDICAL LAWS OF EACH STATE, NOTES OF MINERAL SPRINGS, Etc.

BY

SAMUEL W. BUTLER, M. D.

SECOND EDITION, REVISED AND CORRECTED.

One Volume, large octavo, double columns, 874 pages. Price, Cloth, $5.50; Leather, $6.50.

The **SECOND EDITION** of this important work has been prepared at great cost of time and money. The lists have been carefully revised *by leading men in each State.* Nearly TEN THOUSAND new names have been added, and numerous corrections made. Those who have purchased the first edition will find this one to possess *all the value of a new work.*

This work has a *national* and *historic* value, as well as a present *business* one. Besides the names and addresses of all the physicians in the country, it contains the roster of the medical officers in the Army and Navy, list of the officers of State and County medical societies, a sketch of the medical geography of each State and Territory, analysis of the waters of all prominent mineral springs, and a mass of other information interesting to the profession. The collation of the *laws regulating the practice of medicine* in the various States is a feature of special interest and one not to be found in any other publication.

All who desire to reach medical men for business purposes, for instance, Life Insurance Companies, Medical Colleges, Wholesale Druggists, Importers and Manufacturers of Pharmaceutical Specialties, Dealers in Surgical Instruments, will find this book invaluable.

OPINIONS OF THE PRESS.

From the (London) *Lancet:*
This is the first work of the kind that has ever appeared on the other side of the Atlantic. The Editor and Compiler, Dr. S. W. Butler, and the publisher, are to be congratulated upon an undoubted success.

From the (London) *Medical Press and Circular:*
Upon opening its well-filled and well arranged pages our only surprise is that such a go-ahead race as our cousins have the credit of being, should have gone on so long without so valuable a book of reference.

From the (Philadelphia) *Medical Times:*
To publishers, druggists and those members of the profession whose sympathies and needs are wide enough to reach beyond their own immediate neighborhood, this book must be invaluable.

From the (Cincinnati) *Lancet and Observer:*
Of very great value, and will be to physicians what the city directory is to the man of business, a book he cannot get along very well without.

From the *Medical and Surgical Reporter:*
A volume of very considerable importance, the appreciation of which must grow in time, and it should find a place in every medical library of any pretensions of completeness.

LONDON M'F'G CO.'S
ESSENCES OF MEATS,

FOR INVALIDS, INFANTS AND TRAVELERS.

ESSENCE OF BEEF, MUTTON, CHICKEN

Which consist solely of the finest juices from choice meats, extracted by a gentle heat, without the addition of water, or any substance whatever. They have been prescribed by the English Medical Profession for the past fifteen years, and since their introduction here have earned the highest commendations. They are peculiarly adapted

FOR INVALIDS—Natural, Pleasant, Refreshing.
FOR INFANTS—Strictly Pure; Prepared without Salt,
FOR DYSPEPTICS—Easily Assimilated.
IN CASES OF SEA SICKNESS—Afford Immediate Nourishment.
AFTER CHILDBIRTH—Meat Stimulant; Concentrated Form.

They retain the fine flavor and smell of the Meat. Are a heavy liquid in a warm temperature, and when placed upon ice take a jelly form, which is especially refreshing to Invalids. They are retained upon the stomach, in very critical cases, when the most carefully prepared soup is rejected. Children readily take them, and in many of their complaints requiring nourishment, "Essences" are UNEQUALED. *In summer, when opened, keep on Ice, leaving the lid partly raised.* DO NOT ADD WATER.

Taken cold direct from the Can, needing no Preparation whatever.

ENTIRELY TAKES THE PLACE OF BEEF TEA.

Physicians and Patrons are cordially invited to visit our Works.

PREPARED ONLY BY THE

THE SANITARIAN.

A MONTHLY MAGAZINE,

DEVOTED TO THE PRESERVATION OF HEALTH, MENTAL AND PHYSICAL CULTURE.

A. N. BELL, M.D., Editor. T. P. CORBALLY, M.D., Associate Editor.

"Nothing is more essential than knowledge of our homes and surroundings, and the means by which we can prolong life and increase our comfort, or avoid agents that are deleterious to health. This is the matter THE SANITARIAN gives."—*Johnstown Republican.*

"As its name implies, THE SANITARIAN is devoted entirely to Sanitary Science, in its liberal and proper sense. The field it occupies is a most important one, and the editor is admirably qualified for the work he has undertaken."—*Medical Examiner.*

"THE SANITARIAN is the *only journal published in this country devoted to the prevention of disease.* It contains in each number information to the farmer, mechanic, business man—in fact, to everybody—worth more than the subscription for a year. It is a solid, substantial and honest journal, gives its teachings in plain language, and has no claptraps to work off on its subscribers."—*Methodist Protestant.*

"The Sanitary question is now uppermost in the public mind, and it is gratifying to see that the discussion of it is not going to be kept as a "mystery" in the medical profession. Every human being is concerned in this matter; and if sanitary science has any suggestions to make they must be made directly to the people themselves. This is what the periodical before us aims to do, and this it is doing well."—*Popular Science Monthly.*

In the future, as in the past, it will be the constant effort of the editors to make THE SANITARIAN more and more worthy of the press and the generous support of the public. Its purposes are now so well understood, and, as shown by the extracts above given, so generally appreciated, that any additional prospectus is rendered unnecessary. **$3.00 a year; 30 cents a number. Bound volumes, postage paid, $4 00.**

All communications should be addressed: **THE SANITARIAN, New York.** 1140-1141

DIFFERENTIAL DIAGNOSIS;

A MANUAL

OF THE

COMPARATIVE SEMEIOLOGY

OF THE MORE IMPORTANT DISEASES.

By F. DeHAVILLAND HALL, M.D.,

Assistant Physician to the Westminster Hospital, London.

American Edition, with Extensive Additions.

One Volume 8vo, pp. 205. Printed on handsome tinted paper; bound in English pebbled cloth, with beveled boards. Price, $2.00.

☞ **SENT BY MAIL, POST-PAID, ON RECEIPT OF THE PRICE.** ☜

Dr. HALL's work has received the highest encomiums from the English medical press, for its lucid arrangement, completeness, and accuracy. He himself is known in London as a practitioner of great skill, and an unusually successful medical teacher. His work has been considerably enlarged in this edition, the editor having devoted especial attention to (1) pointing out the *early* and often overlooked symptoms of disease (2), enumerating the *pathognomonic* symptoms, and (3) bringing into relief the *peculiar features* of diseases in this country.

Most of the diseases which may be confounded, are presented in comparative tables, setting forth their distinctive characteristics in the clearest possible light, and thus greatly facilitating their prompt diagnosis.

CONTENTS.

The contents follow, in a general way, the nomenclature of the College of Physicians; thus the work is divided into two parts, the one on General Diseases, the other on Local Diseases.

The First Part contains, among other matters—

The Symptoms of the Febrile State Defined.

Comparative Table of the Temperature and Pulse in the Leading Febrile Diseases.

Differences between Symptomatic and Essential Fever.

Tabular Comparison of Rötheln, Scarlet Fever, Measles, and Smallpox.

Comparison of the Symptoms of Typhoid and Typhus; of Typhoid and Malarial Fever; of Typhoid and Typho-Malarial; of Typhoid Fever and the Typhoid State; of Typhoid and Relapsing Fever.

Diagnosis between Epidemic and Sporadic Cerebro-spinal Meningitis; between Epidemic Meningitis and Typhus; between the Same and Congestive Malarial Fever.

The Signs of the Arthritic, the Scrofulous, the Syphilitic, and the Tubercular Dyscrasiæ.

Gout, Rheumatism, and their Allies.

The Second Part includes the Diagnosis of Local Diseases; embracing, for example—

The Differential Points between Hemorrhage, Thrombosis, and Embolism in the Brain; between the various forms of Sclerosis, Syphilosis, Paralysis, and Ataxy of the Spinal Cord; and between Organic, Functional, Toxic, and Hysterical Paralyses. These extremely difficult problems in diagnosis are set forth with the utmost clearness.

Neuralgia and its Counterfeits (myalgia, spinal irritation, cerebral abscess, alcoholism, hysteria, etc).

Diagnostic Table of Acute, Chronic, Syphilitic, and Tubercular Laryngitis, Perichondritis, Benign and Malignant Growths, and Neuroses of the Larynx.

Distinctions between Inflammatory Croup and Spasmodic Croup, on the one hand, and Membranous Croup and Diphtheria, on the other.

Catarrhal as Distinct from Parenchymatous Tonsillitis.

Normal and Abnormal Chest Sounds (in all, eleven very carefully prepared tables).

Dr. John Hughes Bennett's General Rules for Diagnosing Heart and Lung Affections.

Comparison of the Three Forms of Phthisis.

The Diagnosis of Incipient Phthisis (sixteen different signs are given of its very earliest stage).

Differential Diagnoses between Incipient Phthisis and Bronchitis; between Acute Phthisis and Typhoid Fever; between Capillary Bronchitis and Pneumonia; between Pneumonia and Pleurisy; Pneumothorax and Pneumo-Hydrothorax, etc.

Dr. Dobell's Aphorisms on the Significance of Pain at and near the Heart; his Aphorisms on the Significance of Clubbing of the Finger Ends.

Diagnosis between the Various Cardiac, Aortic, and Mitral Diseases.

The Cheyne-Stokes Respiration Discussed.

To Distinguish Acidity of the Stomach from Fermentation and from Hypersecretion; Stomachal Vertigo from Cerebral Vertigo; Gastric Vomiting from Cerebral Vomiting.

Comparative Symptoms of Atonic Dyspepsia, Chronic Gastritis, Gastric Ulcer, and Gastric Cancer.

Special Points in the Diagnosis of Gastric Cancer.

The Symptoms of Dyspepsia, by Murchison.

Abdominal Phthisis as Distinguished from Typhoid Fever.

Hutchinson on the Diagnosis of Intestinal Obstruction.

Comparison of Enteritis with Colitis.

The Diagnosis of Hepatic Diseases.

Hardy's Handy Tests for Bile in the Urine.

What Pain in the Liver may Signify.

What Jaundice may Signify.

Hepatic Diseases Classified with Regard to the Size of the Liver.

The Symptoms of Internal Parasites.

The Earliest Signs of Bright's Disease.

The Seven Forms of Bright's Disease Compared.

The Four Forms of Diabetes Compared.

The Kinds of Calculi and their Tests.

Besides numerous other diseases and tables not mentioned above.

TO PHYSICIANS.

—:o:—

In order to facilitate the introduction of the metric system, as well as to furnish a convenient posological table, we have published a Visiting List Dose Book, in which the doses are given both in the metric and in the apothecaries' weights and measures. It is light, and neatly bound in flexible silk covers, so that it may be carried in the visiting list or pocket, without inconvenience. This little book renders the use of the metric system easy and attractive, even to old practitioners. All physicians interested in the advancement of our science are urged to aid us in placing this little book in the hands of the profession, not only by sending for it themselves, but by ordering it for their friends. Sent free on receipt of six cents in postage.

Address, THE METRIC CLUB, 188 Clark Street, Chicago. 1141-1149x

WOMAN'S HOSPITAL MEDICAL COLLEGE,

337 and 339 S. Lincoln St., Chicago.

ARTIFICIAL EYES

The finest, best, and most natural Artificial Eyes in the world, inserted, and sold at Wholesale and Retail, by Dr. THEO. ROTH, 336 N. Sixth St., Philadelphia, General Agent for the United States of L. Mueller's Celebrated German Artificial Eyes, which received the Gold Medal at Berlin, Vienna, Philadelphia (1876), etc. 1128-1140

DR. GARRATT'S

Constant Electric Disks,

And BELTS,

That any one can self-apply and wear, for the cure of local **Weakness**, congestion or pain, or **for restoring lost nerve power.** They are noted for constant power to stop headaches and sciatica, to strengthen weak organs, lame back, or thorax, etc.

While worn, by night or day, this silver-zinc Pad, or Belt, self-applies fine primary galvanism constantly, which cures nervous ills. "For the price and purpose it has no equal." So say physicians, druggists, and those now using this constant electric.

Large Disk, 24 poles, $2.50. Disk Belt, with straps to go around the body, $3.50. Extra long, $5. Children's Disk, $1. Much less by the dozen.

ELECTRIC DISK & BELT CO.,

1135-m 5½ Hamilton Place, Boston, Mass.

STAUFFER'S

UTERINE INSTRUMENTS.

The readers of this Journal are familiar with this Series of Instruments, during their rise and progress upwards of ten years. Many have introduced them into their practice, and have written complimentary letters even to this office.

The above late engraving represents—1. The new ***Retroversion Cup,*** with a broad lever of which the corners are rounded and less liable to irritate than the former. 2. ***An Intra-Uterine Stem Cup.*** The Intra-Uterine Stem (hard rubber) is made to order in length and thickness, after a pattern, when desired. The stem is supported as A. Fig. 1 On either belt, and same in price. (*See large plate.*) The stem is inserted after the cup is in position, and locks in a square socket. This gives a reliable and yet yielding base. ***Exchanges.***—To obviate the risk of purchasers, the Hard Rubber part is made exchangeable as all the others are on the catalogue, now aggregating about 150, in size and style of instruments. Over one half belong to the class of Uterine Supporters—the balance to examination and diagnosis. 3. ***Anterversion C.*** The modification consists in a concave rest for the cervix, to retain it in position.

Obtained through this Office, and Catalogues sent on application.

FOR SALE.—THE "GOOD WILL" OF my practice of $3500 to $4000 per year. Price $500. Horse, Top Buggy, Cutter, etc. Stoves, and Furniture difficult to move, can be bought, if wanted, for what it is worth. The residence I now occupy—long a Doctor's home—can be rented.
1142 Address "Medicus," Box 606, Kenosha, Wis.

PRACTICE FOR SALE.—A PHYSICIAN with a practice established twenty-six years, and worth **$5000** per year, who wishes to retire from country practice and go to the city, will introduce a good physician into a splendid business in a thriving country town of 5000 inhabitants in Illinois. Fine country and good pay. Best practice in the county. Also Office of County Physician, at fair salary. I ask no bonus, but offer this rare opportunity to any good doctor who will buy my residence. Price, **$4000,** two-thirds down, balance to suit successor. If not sold by Feb. 1st, 1879, will sell practice for **$1000,** half down. Will also sell C Spring Carriage, Side bar Buggy, 3 Horses, etc., cheap, if desired. Inspection and immediate attention invited. Address DR. SYLVESTER,
1142 Office of Med. and Surg. Reporter.

TO PHYSICIANS.—AN OPPORTUNITY is offered to an enterprising and competent physician who wishes to devote his time and means in assisting to carry on a first-class medical institution, indorsed by many prominent men of the regular medical profession, and situated in a healthful and one of the most desirable localities in the country. Business cash, with no night nor outdoor practice. To the right man a good chance will be offered. No one need apply who cannot furnish valid evidences of integrity and of high moral character. Please state experience, etc., means available, and give references.
Further particulars given on application.
Address Dr. H. J. W.
Care Medical and Surgical Reporter,
1142-1143 115 South 7th St., Philadelphia, Pa.

WANTED—BY A YOUNG PHYSICIAN of six years' practice (married), a position as Physician or Superintendent of some Hospital or Retreat; or, would like to assist or form a partnership with an established Physician in a city. I will sell 1 fine Horse, 2 Good Buggies, 1 Cutter, Robes, etc., also a good Stock of Medicines, very cheap, to any one wishing to purchase an outfit. Address
E. B. HEADLY, M.D.,
1140-1142 Cornwall Bridge, Litchfield Co., Conn.

NUMBERS OF THE HALF YEARLY COMPENDIUM WANTED.—Any one sending us No. 16 or 19 of the COMPENDIUM will receive one dollar and postage. Address to
DR. D. G. BRINTON,
1134 115 South Seventh Street, Phila.

WALNUT HILL,

HARTFORD, CONN.

CHARTERED IN 1874.

An Asylum Home for the treatment of *Inebriates* and *Opium Cases.*

Admirably situated, with ample legal powers of control; based on the fact, confirmed by science and experience, that *Inebriety* is both a physical and mental disease, curable as other diseases are, requiring special treatment in asylums, and in all cases relieved and benefited.

A limited number of patients received, and special facilities provided for each case. The objects sought are rest and building up the diseased organism. Among the means employed are, Turkish baths, electricity, tonics, lectures, amusements, and mental diversion, with exact military and hygienic surroundings. For further information address

T. D. CROTHERS, M.D., Superintendent,
1142-1167 Walnut Hill, Hartford, Conn.

BURN-BRAE,

A PRIVATE HOSPITAL

FOR

MENTAL DISORDERS.

Location beautiful and salubrious. Grounds extensive and handsomely laid out. Distance from Chestnut Street Bridge, Philadelphia, six miles. Access by Baltimore Turnpike, or West Chester and Philadelphia Railroad; nearest station, Oak Lane.

BURN-BRAE accommodates twenty patients of each sex. Though possessing all the safeguards and appliances of a Public Hospital, the arrangements are domestic and familiar. No efforts spared to make the house a comfortable *Home* for its guests.

DEXTRO-QUININE.

Equal to Sulphate of Quinine in the same dose—causes in large doses no cerebral distress nor irritability of the stomach—less than one-half as costly as Sulphate of Quinine.

From recent letters recording CLINICAL EVIDENCE OF THE VALUE OF DEXTRO-QUININE, we extract the following:

Mrs. S., æt. 22, married, no children, brunette, suffering from intermittent fever, first paroxysm Nov. 20th, 6 A.M., again at 4 P.M. Prescribed Cinchonidia sulphate, grs. XXX, chart No. V. One to be taken every two hours.

Nov. 21st. Return of paroxysm at 6 A.M. and 4 P.M. Gave Cinchonidia sulphate, grs. XLV, chart No. V. One to be taken every two hours.

Nov. 23d. Return of paroxysm at same time as on preceding days. Prescribed Dextro-Quinine, grs. XX, chart No. V. One to be taken every two hours. No return of chill since that date, and highly pleased with my experience.

N. H. MANRING, M. D.,
Rigdon, Ind.

Dec. 13th. I have used Dextro-Quinine in two cases of malarial fever complicated with so much irritability of the stomach that Quinine or Cinchonidia could not be given. The Dextro-Quinine was well tolerated by the stomach, and acted precisely like Quinine when given in the same doses.

WM. COMMONS, M. D.,
Union City, Ind.

K&M
One Ounce
DEXTRO-QUININE
"K&M."
COMPOSITION C_{40}. H_{46}. N_4. O_3.
DEXTRO-GYRATE WITH POLARIZED LIGHT.
This article is prepared from commercial purified Chinoidine and consists of the 'Amorphous Quinine' of Liebig or the 'Dicamchinia' of Hesse. It is equal to Sulphate of Quinine in the same dose, while in price it is less than one half as costly.
MANUFACTURED BY
KEASBEY & MATTISON.
CHEMISTS.
PHILADELPHIA. U. S. A.

Price, $1.50 Per Ounce.

Dec. 13th. I am using in the cases of typhoid fever under my charge, your Dextro-Quinine as a substitute for Sulphate of Quinine, in the same doses, and meet with the same effect. I think it an article of *genuine merit.*

D. E. WELLS, M. D.,
Bethlehem, N. H.

Nov. 29th. After using Dextro-Quinine in cases of ague, I deem it equally good, if not preferable to the Quinine Sulphate. Please give me the names of Druggists in St. Louis or Chicago, of whom I can get it.

C. J. RAGLAND, M. D.,
Mulberry Grove, Ill.

Dec. 14th. I have given Dextro-Quinine in two cases of Tertian ague, with the result of promptly arresting the chills. It caused no unpleasant "head symptoms" in either case. The doses were the same as ordinary doses of Quinine. H. A. RODEBAUGH, M. D., Reynoldsburg, O.

Dec. 12th. I find your Dextro-Quinine well tolerated by the stomach, and produces no distress. I think it has the advantage of Sulphate of Quinine in not producing headache and other disagreeable symptoms. L. NEWCOMB, M. D., N. Scituate, Mass.

Dec. 12th. I think the success attending my administration of your Dextro-Quinine in cases of remittent fever justifies me in saying better results could not be obtained with Sulphate of Quinine itself. It has the advantage of Quinine in not affecting the head and being less disagreeable to the palate. Jos. MULLANE, M. D., Lyons, Ind.

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION, CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines, without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris; notably Drs. BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success.

Prepared by **E. GRILLON,** Pharmacien de lère classe, 27 Rue Rambuteau, Paris. To be had of all respectable Chemists throughout the world.

PEPTODYN.

The New Digestive is a combination of the whole of the Digestive Secretions—Pepsine, Pancreatine, Diastase, etc.,

Forming an invaluable remedy in the treatment of all forms of Dyspepsia, and diseases arising from imperfect nutrition.

N. B.—*The success of this Remedy has led to several imitations of it,* which consist largely of Milk Sugar, and, as compared with Peptodyn, are of little or no real value as digestive agents.

SAVORY & MOORE, 143 New Bond Street, London.

Prize Medal.

Silver Medal.

Gold Medal.

Medal of Merit

BOUDAULT'S PEPSINE

IN POWDER, also WINE, ELIXIR, SYRUP, PILLS, AND LOZENGES OF PEPSINE.

Since the introduction of Pepsine by Boudault in 1854, **BOUDAULT'S PEPSINE HAS BEEN, AND IS STILL CONSIDERED, THE MOST RELIABLE,** as is attested by the awards it has received at the Exhibitions of 1867 1868, 1872, 1873, and in 1876 at the Centennial Exposition in Philadelphia.

IT IS THE ONLY PEPSINE USED IN THE PARIS HOSPITALS.

Careful tests will enable any one to satisfy himself that **BOUDAULT'S PEPSINE HAS A DIGESTIVE POWER AT LEAST DOUBLE** that of the best Pepsines in the market, and that it is really the cheapest.

It is Sold in 1 ounce, 8 ounce, and 16 ounce Bottles.

Beware of so-called French Pepsines bearing fictitious names, and prescribe Boudault's only.

BLANCARD'S PILLS

OF UNCHANGEABLE IODIDE OF IRON.

Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of

Blancard

Pharmacien, No 40 Rue Bonaparte, Paris.
without which none are genuine.

BEWARE OF IMITATIONS.

E. FOUCERA & CO., Agents,

NEW YORK.

TO PHYSICIANS.

THE scarcity and high prices of Cinchona barks and Sulphate of Quinia, and the prospect of only a slight reduction in these prices, makes the present a favorable opportunity of calling the attention of the profession to the *combination of all the bark alkaloids.*

Much attention has been given to this subject in Europe and India.

The growing appreciation by the medical profession of the United States of

CINCHO-QUININE

is due to the fact that it retains the important alkaloids IN COMBINATION, — a combination which in practice is *preferable to perfect isolation or separation* of these alkaloids.

In addition to its superior efficacy as a tonic and anti-periodic, it has the following advantages, which greatly increase its value to physicians : —

1st, *It exerts the full therapeutic influence of* Sulphate of Quinine, *in the same doses*, without oppressing the stomach, creating nausea, or producing cerebral distress, as the Sulphate of Quinine frequently does; and it produces much less constitutional disturbance.

2d, It has the great advantage of being *nearly tasteless.* The bitter is very slight, and not unpleasant to the most sensitive, delicate woman or child.

3d, It is *less costly :* the price will fluctuate with the rise and fall of barks, but will always be much less than the Sulphate of Quinine.

4th, It meets indications not met by that Salt.

The following well-known Analytical Chemists say :—

"UNIVERSITY OF PENNSYLVANIA, Jan. 22, 1875.
"I have tested CINCHO-QUININE, and have found it to contain *quinine, quinidine, cinchonine, cinchonidine.* F. A. GENTH,
Professor of Chemistry and Mineralogy."

"LABORATORY OF THE UNIVERSITY OF CHICAGO, Feb. 1, 1875.
"I hereby certify that I have made a chemical examination of the contents of a bottle of CINCHO-QUININE; and by direction I made a qualitative examination for *quinine, quinidine,* and *cinchonine,* and hereby certify that I found these alkaloids in CINCHO-QUININE.
C. GILBERT WHEELER,
Professor of Chemistry."

"I have made a careful analysis of the contents of a bottle of your CINCHO-QUININE, and find it to contain *quinine, quinidine, cinchonine,* and *cinchonidine.*
S. P. SHARPLES, *State Assayer of Mass.*"

TESTIMONIALS.

"WELLFLEET, MASS., Nov. 17, 1876.
"I have used CINCHO-QUININE, and can say without any hesitation it has proved superior to the sulphate of quinine. J. G. JOHNSON, M.D."

"MARTINSBURG, MO., Aug. 15, 1876.
"I use the CINCHO-QUININE altogether among children, preferring it to the sulphate.
DR. E. R. DOUGLASS."

"LIVERPOOL, PENN., June 1, 1876.
"I have used CINCHO-QUININE, obtaining better results than from the sulphate in those cases in which quinine is indicated.
DR. I. C. BARLOTT."

"RENFROW'S STATION, TENN., July 4, 1876.
"I am well pleased with the CINCHO-QUININE, and think it is a better preparation than the sulphate. W. H. HALBERT."

"ST. LOUIS, MO., April, 1875.
"I regard it as one of the most valuable additions ever made to our materia medica.
GEORGE C. PITZER, M.D."

"RICHMOND, VA., March 28, 1877.
"I believe that the *combination* of the several cinchona alkaloids is more generally useful in practice than the sulphate of quinine uncombined.
"Yours truly, LANDON B. EDWARDS, M.D.
Member Va. State Board of Health, and Sec'y and Treas. Medical Society of Va."

"CENTREVILLE, MICH.
"I have used several ounces of the CINCHO-QUININE, and have not found it to fail in a single instance. I have used no sulphate of quinine in my practice since I commenced the use of the CINCHO-QUININE, as I prefer it. F. C. BATEMAN, M.D."

"NORTH-EASTERN FREE MEDICAL DISPENSARY.
908 East Cumberland St., Philadelphia, Penn., Feb. 29, 1876.
"In typhoid and typhus fevers I always prescribe the CINCHO-QUININE in conjunction with other appropriate medicines, the result being as favorable as with former cases where the sulphate had been used.
"F. A. GAMAGE, M.D."

BILLINGS, CLAPP & CO., Manufacturing Chemists,

(SUCCESSORS TO JAMES R. NICHOLS & CO.)

BOSTON, MASS.

RELIABLE

ANIMAL VACCINE.

The undersigned respectfully announces that he has discontinued the practice of furnishing Vaccine *at his residence.*

Physicians can obtain the *Animal Vaccine* of MESSRS. CASWELL, HAZARD & CO., BROADWAY, CORNER 24TH STREET.

FRANK P. FOSTER, M.D.

By our arrangement with Dr. Foster, *all* Vaccine supplied by *us* is *absolutely fresh.*
We can furnish it in any quantity desired, either by express or by mail, if remittance is made to cover postage.
Dr. Foster's Animal Vaccine is the only kind that may be said to have the unqualified endorsement of the Medical Profession of New York.

QUILL SLIPS (half quill, charged on convex surface, at square-cut end).....25 cts.
CAPILLARY TUBES.....$2 00

For ordinary use *Quill Slips* are the most reliable of all forms of stored Vaccine, and in cases of failure with them in *primary* vaccination, if used within one week of their issue, and strictly in accordance with the printed directions, *being in the meantime kept cool and dry*, a second supply will be furnished gratis.
Tubes are intended chiefly for transportation to long distances, as the virus is preserved for a considerable length of time. They are superior to crusts, but inferior to quill slips.
Crusts are not recommended, and are not sold, for the reason that, however fresh, and however well formed they may be, they are apt to prove inefficient.

CASWELL, HAZARD & CO., New York.

APOLLINARIS

NATURAL MINERAL WATER.

HIGHLY EFFERVESCENT.

Approved by the Academy of Medicine of France, and its sale in France authorized by special decree of the French Government.

"THE QUEEN OF TABLE WATERS."—*London Medical Record.*

PROFESSOR OSCAR LIEBREICH, Professor of Medical Chemistry, University of Berlin:—"After minute personal investigation, I can affirm that the Apollinaris Water is bottled according to all the rules of science, and is an entirely Natural Mineral Water."

PROFESSOR J. A. WANKLYN, Lecturer on Chemistry, St. George's Hospital, London:—"I have thoroughly examined the Apollinaris Spring and the method of bottling. The Apollinaris Water, as supplied to the public, is simply and purely a Natural Mineral water, impregnated only with its own gas."

PROFESSOR MOHR, Medical Councilor, University of Bonn:—"After exhaustive investigation, I declare the Apollinaris Water, as supplied to the public, to be purely natural in every respect, and of most excellent quality."

DR. THEODOR KYLL, Analytical Chemist, Town Councilor, Cologne (*expert appointed by United States Vice-Consul, October*, 1877), reported that "The Apollinaris Water, as bottled, deserves in every respect the name of an excellent natural acidulated water."

Every Genuine Bottle bears the REGISTERED YELLOW PICTORIAL LABEL of the Apollinaris Company, Limited, London.

To be had of all Wine Merchants, Grocers, Druggists, and Mineral Water Dealers throughout the United States, and Wholesale of

FREDK. DE BARY & CO., Sole Agents,

1117-1168 **41 and 43 WARREN STREET, NEW YORK.**

DUREL'S
TAR AND IRON SYRUP AND CAPSULES.
PREPARED BY DUREL, PHARMACIST, PARIS.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron is a desideratum which has at last been attained in these preparations. The indications for such a remedy are many, but it has been found especially useful in CHLOROSIS, BRONCHIAL CATARRH, CATARRH OF THE BLADDER, CHRONIC UTERINE DISCHARGES, depending upon an enfeebled or relaxed state of the system.

Sold by Chemists generally.

CRINON'S HÆMOGLOBIN,
The Albuminoid Ferruginous Principle of Blood.

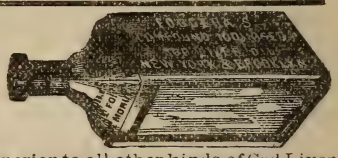
HÆMOGLOBIN is the only physiological chalybeate. Associated as it is with the phosphates of the blood, it forms the most powerful of tonics, and at the same time a most nourishing food. It is especially useful in cases of *Anæmia, Chlorosis, Cachexias, Exhaustion* caused by excess of work, nervous debility, fatigue resulting from parturition and lactation. It replaces entirely liquid blood, which has been recommended and used with success in *Phthisis* and *wasting away.*

It is offered in two forms: In cachets (wafers), 60 of which are contained in a box; combined with chocolate in small squares, 30 of which are in a box; both forms can be sent by mail.

Prepared by C. CRINON, Paris, Pharmacist of the first class, Laureate of the Hospitals of Paris. Samples may be obtained by application to

E. FOUGERA & CO., New York, Agents for the U. S.

FOUGERA'S COMPOUND IODINISED
COD LIVER OIL.



Since the introduction of this oil in 1858, it has been found to be superior to all other kinds of Cod Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod Liver Oil, but also the **tonic, stimulant** and **alterative** properties of **Iodine, Bromine** and **Phosphorus,** which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod Liver Oil.

Through its **increased curative action, FOUGERA'S COD LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod Liver Oil would fail entirely.

FOUGERA'S READY-MADE MUSTARD PLASTERS.

A most useful, convenient, clean, and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths. Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll, of 10 plasters each. DIRECTIONS.—Dip the Plaster, or Plasters, a minute or two, in cold water; apply on the part, and cover with a band.

FOUGERA'S COMPOUND ICELAND MOSS PASTE.
(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, etc.

Wakefulness, Cough, and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this Paste.

FOUGERA'S IODO-FERRO-PHOSPHATED ELIXIR OF HORSE-RADISH.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of antiscorbutic and aromatic plants, and acts as a **tonic, stimulant, emmenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

E. FOUGERA, Pharmacist,
372 Seventh Street, Brooklyn, L. I.,

PNEUMATIC ASPIRATION,

AFTER THE MANNER OF DIEULAFOY.

"It is always possible, owing to Aspiration, to search for a fluid collection without any danger, whatever may be its seat or its nature."

"I have thrust these needles into almost every part of the body; into the Joints, the Liver, the Spleen, the Bladder, the Intestines, the Lungs and the Meninges; and I can affirm, and a great number of observers affirm with me, that we have never seen consecutive accidents."—*Dieulafoy on Pneumatic Aspiration*, pp. 21, 24.

We invite the attention of the Medical Profession to this New Apparatus for Aspiration, constructed upon the general plan of Potain's modification of Dieulafoy's Aspirator, but containing the following improvements and inventions of our own:—

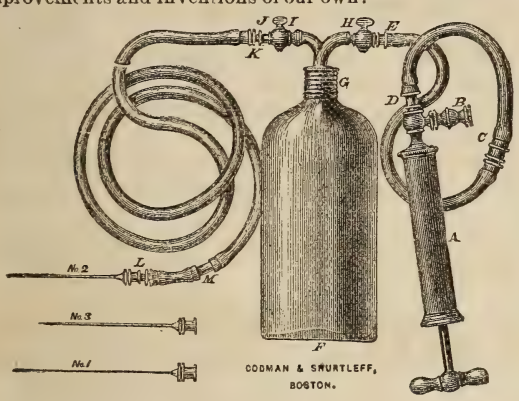

Fig. 68.

Fig. 77.

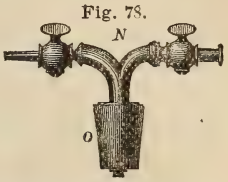

Fig. 78.

The Stopper and Cocks supplied with Apparatus No. 2.

1st. Means of changing the pump from an exhaust to a force-pump, and *vice versa*, thereby enabling the operator not only to draw an abnormal fluid, but to inject the cavity through the tubes and needle of the apparatus with one adapted to induce healthy action.—*See Dieulafoy on Aspiration*, pp. 276, 278.

2d. The employment, in our apparatus No. 1, of a metal Screw Cap, fitting the neck of the receiver supplied with this apparatus so securely that it cannot be forced from its place by condensed air while injecting, or accidentally removed while the receiver is in a state of vacuum for aspiration

3d. The substitution, for the ordinary oiled silk valves of other apparatus, of a kind indestructible, both in form and material.

4th. A simple and comparatively inexpensive attachment for evacuating the contents of the stomach, equal, if not superior, to any in use hitherto.

Commendations bestowed upon our Aspirators, by physicians familiar with the latest European and American ones, lead us to believe that, in some important particulars, at least, they are superior to any.

In his work on Pneumatic Aspiration, Dieulafoy shows the harmlessness of the Aspiratory puncture, and its great superiority to the Exploring Trocar as a means of accurate diagnosis in all collections of Pathological Fluids. It has been used with unprecedented success in the Retention of Urine, Reduction of Strangulated Hernia, in Ascites, Hydrothorax, Empyema, Pneumothorax, Effusions into the Pericardium, Serous, Purulent and Hematic Effusions of the Knee, Hydrocele, Hydatid Cysts, Abscesses of the Liver, and in various other Pathological Lesions.

PRICES OF APPARATUS.

No. 1. Air Pump—exhaust or condensing as described; 16 oz. receiver, of strong glass, with screw-cap; three steel, gold plated Aspiratory Needles, together with the necessary tubes, stop-cocks, etc., as shown in Fig. 77, fitted in a neat case, accompanied with printed directions $16.00. Postage 64 cents.

No. 2. The same, without receiver, and with rubber stopper (see Fig. 78) to fit almost any bottle of quart capacity, or less, instead of screw-cap arrangement, also with printed directions $14.00. Postage 32 cents.

No. 3. Dieulafoy's Notched Aspirator. Nickel-plated, with two Needles, Tubes, etc., in case.....$14 00

No. 4. Stomach Attachment, as described, adapted to pump accompanying Nos. 1 and 2, additional $6.00. Postage 22 cents.

The foregoing are the product of our own factory, and are warranted in every respect.

Also, **Dieulafoy on Pneumatic Aspiration,** post-paid, by mail, on receipt of..... 3 40

☞ *Full description on application.*

An illustrated Catalogue of Surgical Instruments, also a New Pamphlet on Atomization of Liquids, with description of Improved Apparatus and Formulæ of Remedies successfully employed, will be forwarded, post-paid, on application.

TROMMER'S EXTRACT OF MALT.

The rapidly increasing demand for our IMPROVED EXTRACT OF MALT, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantities; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or moulding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expense of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops**, viz: MALT SUGAR, DEXTRINE, DIASTASE, RESIN and BITTER of HOPS, PHOSPHATES of LIME and MAGNESIA, and ALKALINE SALTS.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:—
Malt Sugar 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712. Alkalies .377; Water, 25.7; Total, 99.958.
In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article.

Yours truly,
SILAS H. DOUGLAS,
Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt contains a larger quantity of the active properties of Malt than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ pounds of the Extract.

Our preparations of Malt are for sale by druggists generally, throughout the United States and Canada, at the following prices:—

EXTRACT OF MALT,			*With Hops (Plain)*,	$1.00
"	"	"	*Pyrophosphate of Iron (Ferrated)*,	1.00
"	"	"	*Cod Liver Oil*,	1.00

LIGHT-BROWN

COD LIVER OIL

SELECT MEDICAL OPINIONS.

Sir HENRY MARSH, Bart., M.D., T.C.D.,
Physician in Ordinary to the Queen, in Ireland.

"I have frequently prescribed Dr. De Jongh's Light-Brown Cod-Liver Oil. I consider it to be a very pure oil, not likely to create disgust, and a therapeutic agent of great value."

Dr. JONATHAN PEREIRA, F.R.S.,
Author of
"The Elements of Materia Medica and Therapeutics."

"It was fitting that the author of the best analysis and investigations into the properties of Cod-Liver Oil should himself be the purveyor of this important medicine. I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, *whom I regard as the highest authority on the subject.* The Oil is of the very finest quality, whether considered with reference to its color, flavor, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured."

Dr. EDWARD SMITH, F.R.S.,
Medical Officer to the Poor-Law Board of Great Britain.

"We think it a great advantage that there is one kind of Cod-Liver Oil which is universally admitted to be genuine—the Light-Brown Oil supplied by Dr. De Jongh. It has long been our practice, when prescribing the Oil, to recommend this kind, since, amidst so much variety and uncertainty, we have confidence in its genuineness."—(Extract from "Consumption: Its Early and Remediable Stages.")

Dr. PROSSER JAMES,
Lecturer on Materia Medica and Therapeutics at the London Hospital.

"I have always recognized your treatise on Cod-Liver Oil as the best on the subject, and adopted its conclusion as to the superiority of the Light-Brown over the Pale Oil. I have the less hesitation in expressing myself in this sense since I am only endorsing the opinion sent to you more than twenty years ago by Dr. Pereira, my illustrious predecessor in the chair of Materia Medica at the London Hospital."

Sir G. DUNCAN GIBB, Bart., M.D., LL.D.,
Physician and Lecturer on Forensic Medicine, Westminster Hospital.

"The experience of many years has abundantly proved the truth of every word said in favor of Dr. De Jongh's Light-Brown Cod-Liver Oil by many of our first Physicians and Chemists, thus stamping him as a high authority and an able Chemist, whose investigations have remained unquestioned."

Dr. LETHEBY,
Medical Officer of Health, and Chief Analyst to the City of London.

"In all cases I have found Dr. De Jongh's Light-Brown Cod-Liver Oil possessing the same set of properties, among which the presence of cholaic compounds, and of iodine in a state of organic combination, are the most remarkable. It is, I believe, universally acknowledged that this Oil has great therapeutic power; and, from my investigations, I have no doubt of its being a pure and unadulterated article."

Dr. BANKS,
King's Professor of the Practice of Physic at the University of Dublin.

"I have, in the course of my practice, extensively employed Dr. De Jongh's Light-Brown Cod-Liver Oil, and I have no hesitation in stating that I consider it the best of all the specimens of oil which have ever come under my notice. The fact of so able and accurate an observer as Dr. De Jongh subjecting the Oil to careful analysis previous to its exposure to sale, is a sufficient guarantee of its purity and excellence."

Dr. EDGAR SHEPPARD,
Professor of Psychological Medicine, King's College, London.

"Dr. Sheppard has made extensive use of Dr. De Jongh's Light-Brown Cod-Liver Oil, and has great pleasure in testifying to its superiority over every other preparation to be met with in this country. It has the rare excellence of being well borne and assimilated by stomachs which reject the ordinary Oils."

DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL is supplied ONLY in bottles sealed with BETT'S Patent Capsule, impressed on the top with Dr. DE JONGH'S Stamp, and on the side with his Signature, and the Signature of ANSAR, HARFORD & CO., and bearing under the wrapper a Label with the same Stamp and Signatures. WITHOUT THESE MARKS NONE CAN POSSIBLY BE GENUINE.

Sold in IMPERIAL half-pints, $1.00, by the Principal Druggists in the UNITED STATES.

SOLE CONSIGNEES,

ANSAR, HARFORD & Co., London.

AGENTS FOR THE UNITED STATES,

TO THE MEDICAL PROFESSION.

MALTINE.

(Extract of Malted Barley, Wheat & Oats.)

THIS PREPARATION

Contains from three to five times the Medicinal and Nutritive elements found in Extract of Malt.

MALTINE is a highly concentrated extract of malted *Barley, Wheat,* and *Oats,* containing, undiminished and unimpaired, all the medicinal and nutritious principles found in these cereals. By the most carefully conducted scientific process we are enabled to offer to the medical profession a perfect article, possessing from *three* to *five times* the therapeutic and nutritive merit of any foreign or domestic Extract of Malt.

In support of our claims we invite the attention of the profession to the following points, viz.:

FIRST.—In the manufacture of **MALTINE** the evaporation necessary to reduce it to its great density is conducted in vacuo, at a temperature ranging from 100° to 120° Fahr.; while most manufacturers of Extract of Malt resort to "open pan" or low pressure steam boiling, by neither of which processes can the extract be so produced as to preserve the Diastase, Phosphates, and Albuminoids, on which its remedial value so greatly depends, and the product is either of a dark color or of low specific gravity, possessing little virtue aside from the saccharine matter which it contains.*

SECOND.—*Carbon, Hydrogen, Nitrogen, Sulphur, Iron, Magnesium,* and *Potassium,* are essential elements in the food of man, and it is only in **MALTINE**, containing the combined properties of malted *Barley, Wheat,* and *Oats,* that all these principles can be found in the proper proportions; Extract of Malt made from *Barley alone* is wanting in some of the most important of these elements.

THIRD.— *Gluten* is the most nutritious principle found in the cereals, and is the only vegetable substance which will, alone, support life for any great length of time. It is composed of three distinct nitrogenous principles, together with fatty and inorganic matters, and is analogous to animal fibrin. **MALTINE** contains twenty times the quantity of *Gluten* found in any Extract of Malt.

FOURTH.—Liebig says, "Wheat and Oats stand first among our list of cereals in combining all the elements in proportions necessary to support animal life. They are especially rich in muscular and fat producing elements." The only reason we use Malted Barley, in the manufacture of **MALTINE**, is that it contains larger proportions of mineral matters (bone producers) and Diastase. It is deficient in all other essential elements.

We believe that any practitioner will readily recognize the superiority of MALTINE, and would request a trial and comparison of merits with any article offered for similar uses.

* As a sure test for Diastase, and the Albuminoids, a small quantity should be put in a test tube or small vial, largely diluted with water, and heated to the boiling point, when the Albumen, if present, will coagulate, and appear in little flocculent particles throughout the liquid. If the extract remains clear, it is proof that it has already been coagulated by excessive heat, and removed by filtration during the process of manufacturing. Any heat which will coagulate Albumen will inevitably destroy the digestive power of Diastase.

The Nitrogenous constituents of *MALTINE* have a composition identical with that of the chief constituents of the Blood, and therefore contain nearly every element requisite for the reproduction of the human body.

MALTINE AND ITS COMPOUNDS

can undoubtedly be used with greater success than any other remedy now known, in cases of general and nervous Debility, Indigestion, imperfect Nutrition and deficient Lactation; Pulmonary affections, such as Phthisis, Coughs, Colds, Hoarseness, Irritation of the Mucous Membranes and difficult expectoration; Cholera Infantum and wasting diseases of children and adults; Convalescence from Fevers, and whenever it is necessary to increase the vital forces and build up the system.

WE MANUFACTURE THE FOLLOWING PREPARATIONS, THE FORMULÆ AND DOSES OF WHICH ARE GIVEN IN OUR DOSE BOOKS, AND ON THE LABEL ATTACHED TO EACH BOTTLE:

***MALTINE* WITH HOPS.**

***MALTINE*, FERRATED:**

This combination is specially indicated in Anæmia and Chlorosis, and in all cases of defective nutrition where Iron is deficient in the system.

***MALTINE* WITH PHOSPHATES IRON AND QUINIA:**

A powerful general and nutritive tonic.

***MALTINE* WITH PHOSPHATES IRON, QUINIA AND STRYCHNIA:**

A powerful nutritive, general and nervous tonic.

***MALTINE* WITH PEPSIN AND PANCREATINE:**

One of the most effective combinations in Dyspepsia, Cholera Infantum, and all diseases resulting from imperfect nutrition. It contains three of the all-important digestive agents, Diastase being one of the constituents of the *MALTINE*. We believe there are few cases of Dyspepsia which will not readily yield to the medicinal properties of the above combination, while the system is invigorated by its nutritive qualities.

***MALTINE* WITH BEEF AND IRON:**

One of the most valuable combinations in cases of General Debility, when there is deficient nutrition and a deficiency of Iron in the system.

***MALTINE* WITH ALTERATIVES:**

In this preparation *MALTINE* is combined with the most valuable Alteratives known, such as Iodides, Bromides and Chlorides, and will fully meet the requirements of the practitioners in Syphilis, Scrofula, and all depraved conditions of the blood.

MALTINE WINE.

This preparation contains all the medicinal and nutritive constituents of *MALTINE*, less 60 per cent. of the transformed starch or glucose, which renders the preparation lighter and more acceptable to some stomachs, and is recommended only in such cases.

***MALTINE WINE* WITH PEPSIN AND PANCREATINE:**

(Each fluid ounce of MALTINE WINE contains 15 grains pure PEPSIN and 15 grains pure PANCREATINE).

We can recommend this preparation to the Medical Profession as being the most important remedy ever brought to their notice in all cases of Dyspepsia and Imperfect Nutrition, when the system needs invigorating and replenishing. It will be found, we believe, a perfect remedy in Vomiting in Pregnancy, Cholera Infantum and wasting diseases of children, and in Constipation and Chronic Diarrhœa resulting from mal-nutrition. It will agree with the most irritable stomach.

MALTO-YERBINE.

(Each pint of the above preparation contains 13 ounces MALTINE, 2 ounces CARRAGEEN and 1 ounce YERBINE).

With the nutritive, emollient and demulcent properties of *MALTINE* and *CARRAGEEN*, and the expectorant qualities of *YERBINE* (active principle of Yerba Santa), we offer this preparation to the Profession with the fullest confidence that it is the most perfect remedy yet produced in Chronic Pulmonary Affections, Irritation of the Mucous Membrane, Difficult Expectoration, Bronchitis and ordinary Coughs and Colds.

The Dose of all Preparations of *MALTINE* and compounds is from a dessert to a tablespoonful.

We also manufacture a perfectly prepared EXTRACT OF MALT, from *Barley only.*

MALTINE preparations are sold at the same prices as EXTRACT OF MALT and its combinations, and are put up in half-pint, pint and five-pint amber bottles; each bottle inclosed in a folding paper box.

THE POST-OFFICE LAWS
Forbid anything of an oleaginous nature being sent through the mail.

THEOPHILUS REDWOOD, Ph.D., F. C. S., Professor of Chemistry and Pharmacy to the Pharmaceutical Society of Great Britain, says, in reference to this preparation:—
"UNGUENTUM PETROLEI appears to be obtained from crude Petroleum by fractional distillation and subsequent purification. Products of a similar description have been introduced in pharmacy, and recommended as substitutes for animal or vegetable fats in the preparation of ointments or liniments.
"Among these the UNGUENTUM PETROLEI is distinguished by its having a firmer consistence and a higher melting point, and in these respects it resembles pure lard, from which it differs in that it is entirely free from liability to become rancid or to undergo any chemical change. It has an amber color, and a smooth, jelly-like appearance and is almost wholly free from odor or taste. It is free from, and insoluble in, water. It is very slightly soluble in rectified spirit, but very soluble in ether, in fixed oils and fats. I am of opinion that its characters and properties are such as to render it a valuable adjunct to our Materia Medica."
Dr. TILBURY FOX, London, writes:—"I like the UNGUENTUM PETROLEI very much indeed, and shall not fail to prescribe it."
From "THE LANCET," London, October 20th, 1878.—"Semi-transparent, pale yellow in color, and perfectly free from offensive smell. We consider it a valuable preparation, and hope its use will become as common in England as it is said to be in America."
From "THE MEDICAL TIMES AND GAZETTE," London, October 20th, 1878.—"The substance introduced under the name of UNGUENTUM PETROLEI is of about the consistence of good lard, has no smell, keeps any length of time, apparently without becoming rancid, and may be exposed to any kind of atmosphere without undergoing chemical change. It has long been, we understand, in use in America, where it enjoys a wide-spread popularity; and it will, we doubt not, come into extensive use here also, as a vehicle for making ointments, as a demulcent in various diseases of the skin, and as a lubricant."

NOW IS THE TIME TO SUBSCRIBE
— FOR THE —
Cincinnati Lancet and Clinic,
THE LEADING WESTERN MEDICAL JOURNAL.

It has an able Corps of Contributors; Gives a Condensed Statement of the Progress of Medicine and Surgery; Reviews the Latest Medical Works; Publishes Society Proceedings, and keeps its Readers informed of the Medical News of the Day.

THE CINCINNATI LANCET AND CLINIC is issued *every Saturday*, and contains 20 large octavo double-columned pages of reading matter in every number, and is handsomely printed on fine tinted book paper, neither labor nor expense being spared to adapt it to the daily wants of the American practitioner of Medicine.
THE LANCET AND CLINIC is strictly an independent journal, not being controlled or published in the special interest of any College or Society, but is devoted to the advancement of science and progress of rational Medicine.

SPECIAL INDUCEMENTS.
NEW SUBSCRIBERS, who remit their names and subscription AT ONCE, will receive THE LANCET AND CLINIC from NOW until December 31, 1879,
FOR $3.50.

LONDON MF'G CO.'S ESSENCES OF MEATS

FOR INVALIDS, INFANTS AND TRAVELERS.

ESSENCE OF BEEF, MUTTON, CHICKEN.

These Essences are the finest juices from choice meats, entirely free from fatty or injurious matter. They retain the fine flavor and smell of the meats. Are heavy liquids in a warm temperature and when placed upon Ice take a jelly form especially grateful to invalids. Children will readily take them, and in many of their complaints Essences are unequaled. Being used **WITHOUT WATER,** *they do not cause nausea as does Beef Tea, and they will remain upon the stomach when all other nourishment is rejected. In mental or physical prostration they act as strong stimulants, without the subsequent injurious effects produced by alcohol. In Dyspepsia and all Chronic Diseases of the Stomach, they are easily assimilated and are helpful in Consumption and other wasting diseases. Natural, pleasant and refreshing in fevers. Afford concentrated meat stimulant after child-birth. Are convenient for persons boarding or traveling.*

Taken cold direct from the can, needing no preparation whatever.

Sold by Druggists and Fine Grocers.

THE MEDICAL REGISTER AND DIRECTORY

OF THE

UNITED STATES,

SYSTEMATICALLY ARRANGED BY STATES:

COMPRISING

NAMES, POST-OFFICE ADDRESS, EDUCATIONAL AND PROFESSIONAL STATISTICS, OF MORE THAN 60,000 PHYSICIANS, WITH LISTS OF MEDICAL SOCIETIES, COLLEGES, HOSPITALS, AND OTHER MEDICAL INSTITUTIONS, WITH ABSTRACTS, OF THE MEDICAL LAWS OF EACH STATE, NOTES OF MINERAL SPRINGS Etc.

BY

SAMUEL W. BUTLER, M. D.

SECOND EDITION, REVISED AND CORRECTED.

One Volume, large octavo, double columns, 874 pages. Price, Cloth, $5.50; Leather, $6.50.

The **SECOND EDITION** of this important work has been prepared at great cost of time and money. The lists have been carefully revised *by leading men in each State.* Nearly TEN THOUSAND new names have been added, and numerous corrections made. Those who have purchased the first edition will find this one to possess *all the value of a new work.*

This work has a *national* and *historic* value, as well as a present *business* one. Besides the names and addresses of all the physicians in the country, it contains the roster of the medical officers in the Army and Navy, list of the officers of State and County medical societies, a sketch of the medical geography of each State and Territory, analysis of the waters of all prominent mineral springs, and a mass of other information interesting to the profession. The collation of the *laws regulating the practice of medicine* in the various States is a feature of special interest and one not to be found in any other publication.

All who desire to reach medical men for business purposes, for instance, Life Insurance Companies, Medical Colleges, Wholesale Druggists, Importers and Manufacturers of Pharmaceutical Specialties, Dealers in Surgical Instruments, will find this book invaluable.

OPINIONS OF THE PRESS.

From the (London) *Lancet*.
This is the first work of the kind that has ever appeared on the other side of the Atlantic. The Editor and Compiler, Dr. S. W. Butler, and the publisher, are to be congratulated upon an undoubted success.

om the (London) *Medical Press and Circular:*
Upon opening its well-filled and well arranged pages our only surprise is that such a go-ahead race as our cousins have the credit of being, should have gone on so long without so valuable a book of reference.

From the (Philadelphia) *Medical Times:*
To publishers, druggists and those members of the profession whose sympathies and needs are wide enough to reach beyond their own immediate neighborhood, this book must be invaluable.

From the (Cincinnati) *Lancet and Observer*.
Of very great value, and will be to physicians what the city directory is to the man of business, a book he cannot get along very well without.

From the *Medical and Surgical Reporter:*
A volume of very considerable importance, the appreciation of which must grow in time, and it should find a place in every medical library of any pretensions of completeness.

Published by D. G. BRINTON,

115 South Seventh Street, Philadelphia.

STAUFER'S

SERIES OF HARD RUBBER UTERINE SUPPORTERS.

Fig. 1 from Paragraph 1 to 10.

1. Improvements—a. The Spring Stem Supporters are now sustained by double elastic gums S S, separating both anteriorly and posteriorly after passing through the base T. These gums are furnished to order of more than ordinary strength, when required as in some cases of long standing Procidentia. *b.* The tops C, are of increased volume, hollow and light. *c.* Upon the stems (*m n*) of Spring Cups A, and E, may now duplicates C, or small globes G, be used. Thus on stems A, do work tops A, C, E, or G; the C, and G, by the attachments H. *d.* An additional belt XX. *e.* belt Y, improved. *f.* Retroversion correction through the rectum. *g.* Stem Levers.

2. Tops and Springs.—Each design has numerous sizes. They all unscrew, giving access to the coil spring concealed in tube (*m*). The spring prevents the shock when the base T, is accidentally struck, and together with the elastic gums SS, give the Supported Uterus a double rocking motion.

3. Spring Stem Cup A.—This corrects *Prolapsus* and *Procidentia* and the immobility of the Uterus, unless locked by tumors. This immobility may be diagnosed with certainty by the hard rubber speculums or Lever G, in Examining Case. Another proof of its existence is that when the stem will protrude, at first, and the elevation gradually takes place. In such all self-sustaining instruments are powerless.

4. Globe B.—This is a self-sustaining Hard Rubber Shell, with a cord attached for ready removal, and guarding against loosing. When this can be effectually used of a small size, it is a simple and an admirable support. But when the immobility of the Uterus is known to exist, it is in vain to try any self-sustaining instrument. Plugging up the vagina with a light large size ball usually succeeds in *Procidentia*. But it is not altogether commendable, since it must lie where contraction should take place. The stem supporters should therefore have the preferance. *Procidentia* is the simplest of all displacements to correct, notwithstanding the many and cruel operations still performed.

5. Anteversion C.—This top is of the form of a chestnut. It has no advantage over the globe top, except that in some cases it may retain its position better. The latest experience proves, that when the Uterus is properly carried up with the Stem Cup A, or E C, that the Anteversion in common surrenders. Such is frequently the case in Retroversion. It only requires to place the body in such a position before the cup is fully moved up, that the intestines gravitate in position, and the fundus will follow. Rigid flexions are however exceptions.

6. Fast-handle Cup D.—This is also self-sustaining, when capped over the cervix of a well-fitting size. The brim constitutes a ring, which lodges in the folds of the Vagina, and prevents the Uterus from sliding down.

7. Retroversion E.—This is similar to A, except the *Lever Back*. This elevates and corrects the Retroverted Uterus with certainty. But sometimes the sensitiveness will not tolerate the correction and elevation simultaneous. Hence the advantage of the duplicate tops as a change. Retroversion, the most lamentable of all displacements, when traced in common, is found to proceed from long standing, relapsed, or neglected *Prolapsus*.

8. F's—These are small attachments to cover the screws of Cups A, or E, and Globes G, to make them self sustaining, as a change or when sufficient contraction of the walls of the Vagina takes place to suspense with the external support.

9. Globe Tops G.—These are used in *Anteversion* and *Retroversion* of small sizes; for the latter with longer stems. In Prolapsus, when immobility of the Uterus exists, they are apt to lodge by the side of the Cervix, rather than dislodge it from its unnatural position. No instrument has ever revealed the necessity of a cup and external attachment in so many cases as this.

10. Oblong H.—This was originally designed for the aged and debilitated, since, it is easier to remove and replace than any of the other stem supporters, unless it be the stem lever. It is however confirmed by experience that it is well adapted to the *Prolapsus of the Bladder*. The base of the bulb resists the protrusion while the top rests in the summit of the vagina, and corrects the always attending abnormity of the uterus and its connections, by elongating the vaginia.

11. Stem Levers, Fig. 14—The original Hodge's Lever, or its modifications, are still recommended by some of the latest authorities, but no modification has removed its liability of becoming displaced. The circular walls of the vagina cannot grasp and hold an irregular and unequally touching instrument, unless it is wedged in position, which is contrary to the laws of nature. This stem lever lodges with the curve against the rear of the cervix; according to Hodge's Original design. A free movable size can be selected, and the natural contractions of the vagina are not impeded, but stimulated by elongation.

12. Uterine Supporter E C, Fig. 5—(*Economy*) and elastic abdominal belt Z. The stems are permanent, but the cups of numerous sizes. The cup sets oblique so that the axis of the cup and stem correspond with the axis of the Uterus and Vagina. The omission of the spring is considered by some over-balanced by its complete simplicity. But the self-sustaining cup A D, is a material loss, unless cup D, is also procured. The unscrewing and shifting is thus obviated, and when D, is of a slight increase in size the external support may sooner and more safely be laid aside.

13. Economy.—A womb supporter, with the free exchange privilege of the Hard Rubber part until correct, and warranted to sustain comfortably even already long standing ***Procidenta,*** for $4 50; including the chief of all self-sustaining pessaries, for $6 00, has no parallel in the catalogue of mechanical support of the uterus.

14. Retroversion and Rectum Supporter. Fig. 4.—F, is the rectum supporter. The bulb A, is hollow, and opened by unscrewing cap B. This may be filled with ointment for lubricating the rectum and to prevent the stem from becoming dry and hot. Impregnating the ointment with Monsell's Solution, to arrest the bleeding of piles. C, represents the base of the screw by which a piston is moved within the bulb while in position, and the ointment pressed out. G, the retroversion lever, is screwed on top in place of B.

BELTS.

15. Belt X—Fig. 1. The anterior portion is silk elastic, expanding and contracting within a cover. Duplicate. Price, $2 00.

16. Belt XX—Fig. 2. The front is strong silk elastic, capped above the pubes to grasp the Abdomen. Stayed with whalebones. The sides and rear are divided to admit the lower portion to be drawn tightest. Both X, and XX, are coutil finished.

17. Belt Y.—Fig. 3. This is a well-fitted coutil belt, stayed with whalebones, and the straps over the hips are elastic. This is also furnished in neat cotton material, at $2 00; or with the instruments, in price as with belt X. This is the first design of an abdominal supporting belt sufficiently economical for all classes, that I with justice could recommend.

18. Belts—Both X X, and Y, are cheap and efficient abdominal supporters when required in pregnancy, tumors, inflation, or when varicose veins exist. When ordered with the instruments, will be provided with the necessary attachments. They should not be bare-worn, since the perspiration has a tendency to destroy the elasticity of any elastic webbing.

19. Belt Z.—Fig. 5. This is an elastic webbing of two inches wide. Both belts X, an Z, set above the hips, and support the instruments only. In some cases the lifting of the abdomen takes weight from the internal support, and assists it materialy; whereas, in others it has a reverse action. I know of no rule to diagnose this variation.

20. Selection—The outside diameter of the cup; diameter of the globe, &c., should be given; the style and length of belt; the measure to be taken around the waist for X, and Z. Over the hips for X X, and Y. When the selection in part or wholly is left to me, the case should be described as follows:—How displaced? Age, and how long standing? If children how many? State of catamenia now and heretofore. Whether it be the result of an accident or unknown cause? When a pessary already worn, its name, size and result If retroversion, the condition as regards helplessness, &c.

21. Exchanges.—The Hard Rubber part has a free exchange privilege in size or style, until correct. The difference to be remitted when more costly ones are required. The duplicate tops, also B, and D, are taken back at cost in exchange for a complete set unless damaged. No spring working stems, however, are sold alone to supply duplicates.

1879. BEGIN NOW! 1879.

UNEQUALED INDUCEMENTS!

NEW SUBSCRIBERS WILL RECEIVE

THE WEEKLY

MEDICAL AND SURGICAL REPORTER

From October, 1878 until December 31st, 1879,

FOR $5.00!

The MEDICAL AND SURGICAL REPORTER has been established over thirty years, and has, it is believed, a *bonâ fide* subscription list, unsurpassed by any medical weekly in America.

It is issued every Saturday, neatly cut and bound, and gives 24 large octavo, double-columned pages of reading matter in each number. It claims the following

SPECIAL FEATURES.

IT IS INDEPENDENT, being controlled by no clique, college, society or publishing house.

COSMOPOLITAN. Having subscribers and contributors in every State in the Union, it is edited in the interest of *the whole profession*, not of one section or locality.

EMINENTLY PRACTICAL. Special prominence is given to Diagnosis and Therapeutics—the *recognition* and the *treatment* of disease, the real *business* of the professional man.

UNSURPASSED IN CHEAPNESS. When the *size* and *number* of its pages, and its frequency of issue are taken into account, it gives more matter for the money than any other medical journal in this country.

PARTICULARLY SUITED TO COUNTRY PHYSICIANS. It has always been a special aim of the editor to furnish a journal that would keep a reader remote from medical centres *fully up to the times* in his profession. Every surgical invention and new remedy of value, every medical book of moment, every professional discussion or news item of interest, will be found recorded in its pages. *Contributions* from country physicians are always welcome.

THE HALF-YEARLY COMPENDIUM

Appears on January 1st and July 1st of each year, forming two semi-annual volumes of 300 large octavo pages each, with complete Index. It has been established ten years, with a constantly growing circulation.

☞ While complete in itself, it is also intended as a **Companion Journal to the Medical and Surgical Reporter**; it is made up from articles *which have not been included* in the latter. The one journal is the Complement of the other.

From 600 to 700 separate articles appear each year in its various departments, carefully prepared, and giving the choicest selections from all sources, American and Foreign. It is the *only* work of the kind which does justice to *American* writers in medicine.

PRICES PER YEAR.

***The Weekly Medical and Surgical Reporter*.....$5.00**
***The Half-Yearly Compendium of Medical Science*..... 2.50**
***The Reporter and Compendium taken together*..... 7.00**

Payable in Advance.

1141-1192 W. H. BYFORD, A.M., M.D., *President.*

NEW BOOKS.

JUST PUBLISHED.

Napheys. *Medical Therapeutics.* Sixth edition (1879), 607 pp. Price, cloth, $4.00, leather, $5.00.

This sixth edition has been thoroughly revised, as may be judged from the fact that the Index of Authors contains 188 names not in former editions. A number of new articles have been added, and even those having former issues of the work will find this edition a valuable investment.

Hall, F. De Havilland. *Differential Diagnosis.* A Manual of the Comparative Semeiology of the more important Diseases. 1 vol., square 8vo., pp. 205, cloth. Price $2.00

The author, Dr. Hall, is an eminent London physician and clinical teacher. The *British Medical Journal* says of his book: "It does not partake of the objectionable type of books brought out by 'grinders;' it is an invaluable aid by the bedside, enabling the practitioner and student readily to compare signs met with in disease with those observed in health." An eminent Indiana physician writes: "The Diagnosis is received; I am *immensely* pleased with it."

Sayre, L. E. *Organic Materia Medica and Pharmacal Botany.* 8vo., pp. 220. Price $2.00.

This is a conspectus of the vegetable and animal drugs, including all the officinal and all the new non-officinal preparations. Brief, clear and cheap, it is just the book to post one's self on medical botany and "new remedies." There are charts of botanic materia medica; geographical grouping of plants; table of alkaloids with source, and doses (very complete, and not to be found in any other work); table of antidotes and incompatibles, etc.

Anderson, W. A. *Self-Copying Prescription Record.* Price 50 cts. Three for $1.00.

These records are books of prescription blanks, with carbon paper, case, etc., so arranged that a copy of a prescription is made when it is written; the original is sent to the druggist, the copy retained; and thus, without the slightest trouble, the physician has a record of all his professional work. Wherever used, they have been much liked.

Landolt, E. *A Manual of Examination of the Eyes.* Translated by Dr. Swan M. Burnett. 1 vol., cloth, pp. 250. Price $2.50.

Dr. Landolt is director in the Ophthalmological Laboratory at the Sorbonne, Paris, and his treatise on the Diagnosis of the diseases of the eye has been most favorably received in Europe. The translator, Dr. Burnett, is well known as an ophthalmologist in this country.

☞ Any of the above works will be sent, postpaid, by the publisher, on receipt of the price; or they can be ordered through booksellers.

D. G. BRINTON,

115 S. 7th St., PHILADELPHIA.

AN OPENING FOR A PHYSICIAN.—AN opportunity is offered to an enterprising and competent physician who wishes to invest his means to good advantage and assist in a first-class sanatory and medical institution, indorsed by many prominent men of the regular medical profession, and situated in a healthful and one of the most desirable localities in the country. Business cash, with no night nor out-door practice. A full investigation invited. To the right man a good chance will be offered. No one need apply who cannot furnish valid evidences of integrity and high moral character. Please state experience, etc., means available, and give references.

Further particulars given on application.

Address Dr. H. J. W.,
Care MEDICAL AND SURGICAL REPORTER,
1145-1146 115 South 7th St., Philadelphia, Pa.

FOR SALE.—I DESIRE TO SELL MY practice, amounting to from $3500 to $4000. Also House and Lot, Horses, Buggy, and Household Furniture. Goodwill of practice will be sold separate. To a young graduate this is a rare chance, and will be sold cheap, as the subscriber wants to move East. Apply to J. W. Jamison, M.D., Mondamin, Harrison Co., Iowa.
1145-

WALNUT HILL,

HARTFORD, CONN.

CHARTERED IN 1874.

An Asylum Home for the treatment of *Inebriates* and *Opium Cases*.

Admirably situated, with ample legal powers of control; based on the fact, confirmed by science and experience, that *Inebriety* is both a physical and mental disease, curable as other diseases are, requiring special treatment in asylums, and in all cases relieved and benefited.

A limited number of patients received, and special facilities provided for each case. The objects sought are rest and building up the diseased organism. Among the means employed are, Turkish baths, electricity, tonics, lectures, amusements, and mental diversion, with exact military and hygienic surroundings. For further information address

Manufactures and keeps constantly on hand a general assortment of

SURGICAL INSTRUMENTS,

Of the finest quality and most approved patterns.

Orders from Country Physicians will receive particular attention. 1035-tf

DEXTRO-QUININE.

Equal to Sulphate of Quinine in the same dose—causes in large doses no cerebral distress nor irritability of the stomach—less than one-half as costly as Sulphate of Quinine.

From recent letters recording CLINICAL EVIDENCE OF THE VALUE OF DEXTRO-QUININE, we extract the following:

Mrs. S., æt. 22, married, no children, brunette, suffering from intermittent fever, first paroxysm Nov. 20th, 6 A.M., again at 4 P.M. Prescribed Cinchonidia sulphate, grs. XXX, chart No. V. One to be taken every two hours.

Nov. 21st. Return of paroxysm at 6 A.M. and 4 P.M. Gave Cinchonidia sulphate, grs. XLV, chart No. V. One to be taken every two hours.

Nov. 23d. Return of paroxysm at same time as on preceding days. Prescribed Dextro-Quinine, grs. XX, chart No. V. One to be taken every two hours. No return of chill since that date, and highly pleased with my experience.

N. H. MANRING, M. D.,
Rigdon, Ind.

Dec. 13th. I have used Dextro-Quinine in two cases of malarial fever complicated with so much irritability of the stomach that Quinine or Cinchonidia could not be given. The Dextro-Quinine was well tolerated by the stomach, and acted precisely like Quinine when given in the same doses.

WM. COMMONS, M. D.,
Union City, Ind.

K&M
One Ounce
DEXTRO-QUININE
"K&M."
COMPOSITION C_{40}. H_{46}. N_4. O_3.
DEXTRO-GYRATE WITH POLARIZED LIGHT.
This article is prepared from commercial purified Chinoidine and consists of the "Amorphous Quinine" of Liebig or the Diconchinia of Hesse. It is equal to Sulphate of Quinine in the same dose, while in price it is less than one half as costly.
MANUFACTURED BY
KEASBEY & MATTISON.
CHEMISTS.
PHILADELPHIA. U. S. A.

Price, $1.50 Per Ounce.

Dec. 13th. I am using in the cases of typhoid fever under my charge, your Dextro-Quinine as a substitute for Sulphate of Quinine, in the same doses, and meet with the same effect. I think it an article of *genuine merit.*

D. E. WELLS, M. D.,
Bethlehem, N. H.

Nov. 29th. After using Dextro-Quinine in cases of ague, I deem it equally good, if not preferable to the Quinine Sulphate. Please give me the names of Druggists in St. Louis or Chicago, of whom I can get it.

C. J. RAGLAND, M. D.,
Mulberry Grove, Ill.

Dec. 14th. I have given Dextro-Quinine in two cases of Tertian ague, with the result of promptly arresting the chills. It caused no unpleasant "head symptoms" in either case. The doses were the same as ordinary doses of Quinine. H. A. RODEBAUGH, M. D., Reynoldsburg, O.

Dec. 12th. I find your Dextro-Quinine well tolerated by the stomach, and produces no distress. I think it has the advantage of Sulphate of Quinine in not producing headache and other disagreeable symptoms. L. NEWCOMB, M. D., N. Scituate, Mass.

Dec. 12th. I think the success attending my administration of your Dextro-Quinine in cases of remittent fever justifies me in saying better results could not be obtained with Sulphate of Quinine itself. It has the advantage of Quinine in not affecting the head and being less disagreeable to the palate. Jos. MULLANE, M. D., Lyons, Ind.

DOCTOR RABUTEAU'S

(Laureate of the Institute of France.)

DRAGEES, ELIXIR & SYRUP

Of Proto-Chloride of Iron.

"The experiments made in the hospitals of Paris have demonstrated that *Dr. Rabuteau's Dragees, Elixir and Syrup* regenerate the red globules of the blood with a rapidity never observed with the use of the other ferruginous preparations. These results have been proved by the various *Compt-Globules.*

"The ferruginous preparations of *Dr. Rabuteau* do not cause any constipation, and are perfectly tolerated by the weakest persons."—*Gazette des Hospitaux.*

Dr. Rabuteau's Elixir is prescribed when some difficulty is experienced in swallowing the Dragees; it is especially adapted to weak persons, whose digestive functions need strengthening or stimulating.

Dr. Rabuteau's Syrup is especially prepared for children, who take it readily, because of its agreeable taste.

MEYNET'S

DRAGEES OF COD-LIVER EXTRACT.

Careful experiments have established the fact that the **EXTRACT OF COD LIVERS** contains very valuable properties, which render it superior to the ordinary cod-liver oil. It is composed principally of *Gaduine*, large proportions of *Iodides, Chlorides, Bromides, Phosphoric Acid, Lime, Soda* and *Ammonia*, and especially *Propylamin*, all of which enter, but in very small proportions, into cod-liver oil.

These dragees of pure cod-liver extract take the place of cod-liver oil, and have been used with eminent success by medical celebrities of Europe in cases of *Scrofula, Rheumatic Affections, Rachitism, Phthisis*, and in all cases where a propylamic medication is indicated.

MEYNET'S DRAGEES are sold in bottles containing 100 dragees. Dose, 2 to 6 a day. Each dragee is equivalent to two tablespoonfuls of cod-liver oil.

MEYNET'S GRAINS are small granules intended for children. 10 are equivalent to 1 dragee.

E. FOUGERA & CO., New York, Agents for the U. S.

RIGOLLOT'S MUSTARD PAPER.

Is one of the most important and useful discoveries of the age, but it is not (as certain dealers of bad faith pretend) a preparation that any one can make, for it is not manufactured with a mustard that every one can buy.

RIGOLLOT'S MUSTARD PAPER.

Is the invention of Mr. P. RIGOLLOT, who is the exclusive owner; it is the only preparation which has been adopted by the civil and military hospitals and the armies and navies of France and England, and which has obtained a medal at the Centennial Exposition at Philadelphia. All other mustard plasters or leaves of whatever name, are but imitations of the original

RIGOLLOT'S MUSTARD PAPER.

Physicians will find it the most reliable sinapism, prompt and certain in its action, and will therefore always prescribe it. Every sheet in order to be genuine must bear the annexed signature of the inventor, *P. Rigollot*

Sold in tin boxes containing 10 sheets, also 25 and 100 sheets, by all respectable chemists throughout the world.

E. FOUGERA & CO., Agents,

NEW YORK.

PHOSPHOROLE.

PHOSPHORUS and COD-LIVER OIL

have now an established position throughout the civilized world as important therapeutical agents. A *perfect combination* of the two has long been a desideratum, since they are both of value in the same disorders, while the cases in which one is demanded and the other contra-indicated are exceedingly rare.

The combination in PHOSPHOROLE has the twofold advantage of furnishing *the best possible form* for the administration of *phosphorus*, and *a more effective form* for the administration of *cod-liver oil*.

With regard to the former, it has been decided by the highest chemical and medical authorities that *phosphorus* should be administered *in a free state*, and in a vehicle which ensures its *perfect diffusion*, its *absolute unalterability*, and, as far as possible, its *prompt assimilation* without the gastric irritation to which the ordinary methods of exhibiting the agent give rise. It is well known that pills, emulsions, solutions in ether, chloroform, vegetable oils and resin, etc., have all failed to fulfill one or more of these conditions. Even an ordinary solution of phosphorus in cod-liver oil would not answer the purpose in all respects. We claim, however, that PHOSPHOROLE completely satisfies all the conditions. From the method of preparing it, in an atmosphere of dry carbonic acid, the phosphorus is *entirely dissolved without oxidation*, and by our mode of manipulation *a positive uniformity of strength* is ensured. It is then promptly bottled and sealed, and its *stability and permanence* thus secured. The exact amount of phosphorus in each dose is known, its efficiency is ensured, and the irritant effects upon the stomach are reduced to a minimum by the blandness of the oil. As a means then of administering *phosphorus* in the many cases in which it is indicated as a *nervous tonic and stimulant*, it is claimed that PHOSPHOROLE is the best attainable in the present state of our knowledge.

The value of *cod-liver oil* in phthisis is so familiar to the physician that it is needless to dwell upon it. But the value of *phosphorus* is also universally recognized in this disease, especially when complicated with nervous derangements. The *combination* of the two therefore furnishes a more effective form for the administration of cod-liver oil in the great majority of cases in which that remedy is indicated, and one which will at once commend itself to the profession.

A dose of two teaspoonfuls of PHOSPHOROLE contains $\frac{1}{100}$ of a grain of phosphorus. This dose, when given after a meal, is effective, and not very liable to interfere with digestion. *Phosphorus is cumulative in its action, and should be administered with watchful care.* About $\frac{1}{12}$ grain is considered the largest safe dose, and we rarely need go higher than $\frac{1}{20}$ or $\frac{1}{30}$ of a grain. At the very first appearance of the smallest gastric derangement, the exhibition of phosphorus should be stopped.

PHOSPHOROLE is handsomely put up in pint bottles only, and may be obtained at all first-class druggists throughout the United States.

CAUTION!!—SPECIFY McKESSON & ROBBINS'.

☞ SUPERIOR TO PEPSIN OF THE HOG.

INGLUVIN

FROM THE

Ventriculus Callosus Gallinaceus.

A specific for VOMITING IN PREGNANCY, a potent and reliable remedy for the cure of INDIGESTION, DYSPEPSIA, and SICK STOMACH, caused from debility of that organ. It is superior to the Pepsin Preparations, since it acts with more certainty, and effects cures where they fail.

"A New Remedy, INGLUVIN."

By A. F. SHELLY, M.D., of Philadelphia.

"This is obtained from the gizzard of the domestic fowl (chicken), and is a *Specific for Vomiting in Pregnancy.* I have used this remedy for twenty-five years, and it has never failed. It is also the most *powerful* and *reliable remedy* for the *Cure* of *Indigestion, Dyspepsia,* and *Sick Stomach,* caused from debility of that organ. It is useful in all cases where pepsines and pancreatines are used, but with much more certainty of good results.

"In complicated affections of the Stomach, such as *Inflammation, Gastralgia, Pyrosis,* etc., it may be combined with Subnitrate of Bismuth and opiates; and in Diarrhœa and Cholera Infantum, with astringents, both vegetable and mineral. I have given the article to several prominent physicians, who have used it with the happiest results, among whom I may mention Prof. E. WALLACE, of the Jefferson Medical College."

AN EFFICIENT REMEDY AND AN AGREEABLE SUBSTITUTE FOR COD LIVER OIL.

PROF. TROUSSEAU'S

CARBONIZED

FRESH MEAT CURE.

Consisting of TENDER, RAW, LEAN BEEF, desiccated in vacuum, combined with CARBON as an antiseptic, and medicated with HYPOPHOSPHITES OF LIME, SODA, and POTASSA with CINCHONA. A medicated, nourishing food, pleasant to take and easily digested, for the cure of

Consumption, Chronic Dysentery, and Exhausted Conditions consequent upon Typhus and Typhoid Fevers, Typhoid Pneumonia, Diphtheria, General Debility, Nervousness, and Prostration from whatever cause.

In presenting this to the Medical Practitioners of the United States, we scarcely deem it necessary to extol a remedy the efficacy of which they must determine by actual trial. We believe, as Pharmaceutical Chemists, that we have overcome a difficulty by making this preparation of fresh meat stable under all circumstances; while, at the same time, it is potent, efficacious, and palatable.

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION,

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil, by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM, instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat, in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion may therefore be regarded as Chyle obtained by nature's own process. In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more stable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatized Cod-Liver Oil, the active digestive principle of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Pancreatine effects the digestion and assimilation of Cod-Liver Oil and Fat, as well as Food generally. This palatable and popular remedy is therefore invaluable to PATIENTS WHO ARE UNABLE TO DIGEST COD-LIVER OIL, and who are thus deprived of its nourishing and invigorating properties.

Pancreatine Wine. An excellent vehicle for taking Cod-Liver Oil and promoting the digestion of it.

NEW HYPODERMIC SYRINGES.

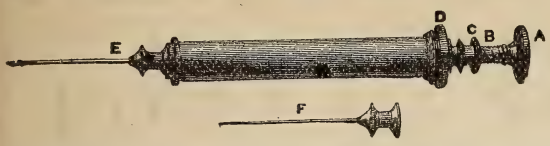

FIG. 48.—No. 2.

These cuts (two-thirds the actual size) represent a New Hypodermic Syringe of our Manufacture. With the exception of the needles, it is of German Silver, a material chosen as possessing, next to steel, the greatest rigidity and durability, while free from liability to oxydation. The barrel is formed by a process peculiar to ourselves, securing uniformity of calibre without soldered joint or seam. It is plated inside and outside with nickel. The piston is packed in the double parachute form, with leather prepared expressly for the purpose. It will be found to retain its elasticity, to operate smoothly, to resist all tendency of fluid to pass above, as of air below it. A nicely-engraved scale upon the piston-rod indicates minims, thirty being the capacity of the syringe.

Syringes Nos. 2, 3, and 4 have also a screw thread upon the piston-rod, and a traverse nut, thereby favoring the utmost nicety in the graduation of doses.

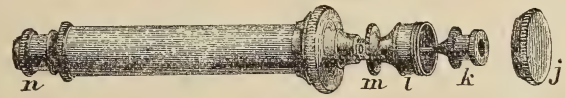
No. 3, Compact, has hollow piston rod to receive one needle, also a protecting cover and fluid retainer; it may be carried in the Pocket Instrument or Vial Case, or without any case.

No. 4, Compact, is like No. 3, with the addition of a second needle, carried upon the syringe in the usual place, protected by a metal shield.

Nos. 1 and 2 are put up in neat morocco-covered case, with vial.

Two sizes of needles are furnished with each instrument, Nos. 1, 2, and 4; one only with No. 3. They are of refined steel, carefully tempered, and thoroughly plated with gold; they are of small diameter and large relative calibre, sharpened to such an angle as will offer least resistance to penetration, and therefore cause least pain. At the point of union with the socket they are reinforced with an outer covering of German silver, thereby overcoming the tendency to become broken at this place. They are connected with the barrels by a screw thread.

Prices: No. 1, *$3.50* No. 2, *$4.00* Postage, .03
" No. 3, *2.50* No. 4, *3.50* " .02



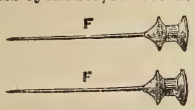
No. 3.

These Syringes are so thoroughly and strongly made as to be free from the annoying accidents common to most Hypodermic Syringes; and we believe that, for convenience, durability, and nicety of construction, they have no superior.

OTHER HYPODERMIC SYRINGES.

		Postage.
No. 7, glass-barrel, graduation engraved on barrel, with screw nut on piston, nickel-plated mountings, two best steel gilt needles, in neat case	*$3.00*	.02
No. 9, glass, graduation engraved and numbered on piston-rod, with screw nut, best steel gilt needles, in neat case	*3.00*	.02
No. 7 or No. 9, with two steel unplated needles either	*2.50*	.02
No. 10, glass, Luer's (French), graduation as No. 9, one gold needle and two steel needles, silver mountings, neat velvet-lined morocco case	*12.00*	.02

No. 11, glass cylinder, fenestrated, nickel plated metal mounting (see cut).



No. 11.

As represented in the cut, the glass cylinder is encased in a metal mounting, fenestrated to show the graduations for minims. The instrument may readily be taken apart for cleaning, and for those who prefer glass, is recommended for its non liability to breakage. Price, with two best steel gilt needles, in a neat case..... *$3.50* Postage. .02

☞ *Any of the above will be sent by return mail on receipt of Price and Postage.* ☜

CODMAN & SHURTLEFF,

Makers and Importers of Superior Surgical Instruments,

1149-1191eow 13 & 15 TREMONT STREET, BOSTON, MASS.

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt. and all its combinations.

Extract of Malt,

WITH COD-LIVER OIL,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO,

(See Transactions of American Medical Association, for 1876, page 176.)

Is presented to the medical profession as an efficient, palatable and very stable combination, consisting of equal parts of the ***Extract of Canadian Barley Malt*** and the best quality of genuine ***Norwegian Cod-liver Oil.*** Many patients take this preparation who cannot take the oil in any other form. It may be employed in all cases where Cod-liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

Extract of Malt,

WITH COD-LIVER OIL AND PHOSPHORUS,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod-liver Oil, Phosphorus being added in the proportion of $\frac{1}{100}$ grain to the dose, and so combined as to be perfectly protected from oxidation. The ***Trommer Extract of Malt Company*** prepare this combination agreeably to the suggestion of ***Dr. Wilson Fox.*** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

Extract of Malt,

WITH COD-LIVER OIL AND IODIDE OF IRON

added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod-liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians, referring to it in terms of high praise.

1090-1115eow

In corresponding with Advertisers please mention THE MEDICAL AND SURGICAL REPORTER.

TO THE MEDICAL PROFESSION.

LACTOPEPTINE,

The most important remedial agent ever presented to the Profession for Indigestion, Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all diseases arising from Imperfect Nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase, or Veg. Ptyalin, Lactic and Hydrochloric Acids, in Combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk.....40 ounces.	Veg. Ptyalin or Diastase.....4 drachms.
Pepsin..... 8 ounces.	Lactic Acid.....5 fl. drachms.
Pancreatine..... 6 ounces.	Hydrochloric Acid.....5 fl. drachms.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its almost universal adoption by the Profession is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned having tested LACTOPEPTINE, recommend it to the Profession:—

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine, University of the City of New York.

LEWIS A. SAYRE, M.D.,
Professor of Orthopædic Surgery and Clinical Surgery, Bellevue Hospital Medical College.

F. LE ROY SATTERLEE, M.D., PH.D.,
Professor of Chem., Mat. Med. and Therap. in the N. Y. College of Dent.; Prof. of Chem. and Hygiene in the Am. Vet. College, etc., etc.

SAMUEL R. PERCY, M.D.,
Professor Materia Medica, New York Medical College.

A. VAN DEVEER, M.D.,
ALBANY, N. Y., June 8th, 1878.
Prof. of the Prin. and Prac. of Surg., Albany Med. Col.; Surg. Albany and St. Peter's Hospitals.
"I have given LACTOPEPTINE a good thorough trial, and have been greatly pleased with the excellent results that have followed its administration."

JOHN H. PACKARD, M.D.,
PHILADELPHIA, PA., May 30th, 1878.
Pres't Phila. Co. Obstet. Society; Surg. Episcopal and Women's Hospitals.
"I have found great satisfaction in the use of LACTOPEPTINE, and have ordered it frequently in cases of Dyspepsia, especially where there is want of tone and defective secretion."

JAS. AITKEN MEIGS, M.D.,
PHILADELPHIA, June 20th, 1878.
Prof. of the Institutes of Med. and Med. Juris., Jeff. Medical College; Phy. to Penn. Hos.
"I have used LACTOPEPTINE with very good effect in a number of cases of Dyspepsia."

W. W. DAWSON, M.D.,
CINCINNATI, O., June 21st, 1878.
Prof. Prin. and Prac. Surg., Med. Col. of Ohio; Surg. to Good Samaritan Hospital.
"I have used LACTOPEPTINE with great advantage in cases of feeble digestion."

ALBERT F. A. KING, M.D.,
WASHINGTON, D. C., June 19th, 1878.
Prof. of Obstetrics, University of Vermont.
"I have used LACTOPEPTINE both in hospital and private practice, and have found it to answer fully the purposes for which it is recommended. As an immediate aid to the digestive function, I know of no remedy which acts more directly."

D. W. YANDELL, M.D.,
LOUISVILLE, KY., March 7th, 1878.
Prof. of the Science and Art of Surg. and Clinical Surg., University of Louisville.
"I have made much use of LACTOPEPTINE, and take great pleasure in stating that it has rarely disappointed me. I shall, of course, continue to prescribe it."

ROBT. BATTEY, M.D.,
ROME, GA., June 8th, 1878.
Emeritus Prof. of Obstetrics, Atlanta Med. College, and Ex-Pres. Med. Association of Ga.
"I have used LACTOPEPTINE in a case of Dyspepsia with satisfaction. I think well of it."

CLAUDE H. MASTIN, M.D., LL.D.,
MOBILE, ALA., June 8th, 1878.
"I consider LACTOPEPTINE the very best preparation of the kind which I have ever employed, and for patients with feeble digestion I know of nothing that is equal to it."

Prof. H. C. BARTLETT, PH.D., F.C.S.,
LONDON, ENG., February 22d, 1876.
"I find the preparation of LACTOPEPTINE contains within itself all the principles required to promote a healthy digestion.

PRICE LIST.

LACTOPEPTINE (in oz. bottles).....per oz.	$1.00
" (" ").....per doz.	10.00
" (in ½ lb ").....per lb.	12.00

We also prepare the various Elixirs and Syrups, in combination with Lactopeptine.

CONSPECTUS

OF

ORGANIC MATERIA MEDICA

AND

PHARMACAL BOTANY,

COMPRISING

THE VEGETABLE AND ANIMAL DRUGS, THEIR PHYSICAL CHARACTER, GEOGRAPHICAL ORIGIN, CLASSIFICATION, CONSTITUENTS, DOSES, ADULTERATIONS, &c.,

By L. E. SAYRE, PH.G.

1 Vol. 8vo., pp. 220, with Folding Tables. Price, in Cloth, by mail, post paid, $2.00.

PLAN OF THE WORK.

The Chart.—In the space of seventeen of the first pages is found the whole Materia Medica, arranged according to Natural Orders. Every drug is mentioned. Opposite the column of drugs are arranged in a tabular manner all the following points concerning it: Officinal Name, Botanical Name, Common Name, Habitat, Part Used, Constituents, Medical Properties, Dose, Officinal Preparations; making in all 10 columns, supplying the place of the cumbrous broadsides heretofore in use for this purpose.

Geographical Grouping of Drugs.—This comprises three pages, giving the characteristic drugs derived from different sections of the world.

Botany.—This subject is treated as an introduction to other and more voluminous treatises, under the following heads:—The Cell, Cell Modification, Tissues, Cell Development, Contents of Cells; The Stem, Subterranean Stems, Leaves Flowers, Fruits and Seeds. The arrangement and display of the material is such that it will rather fascinate than tire the student. The botanical terms are, in every case, made clear by definition, so that they are readily comprehended.

Natural Orders.—This chapter opens with a general treatise upon the subject, followed by a tabular arrangement of the principal natural orders. The most prominent characteristics of these and their sub-orders are brought out unencumbered with such detail as a manual of botany would give, thus furnishing points to refresh the memory, and giving an appropriate outline for the beginner.

Drugs—Their Characteristics, Constituents, &c., &c.—This subject occupies the body of the work. In one hundred and fifty pages are embraced not only all the drugs which are officinal in the U. S. P., but others of any prominence, especially those recently brought into favor. They are arranged according to their physical characteristics, thus bringing together the various parts of the plants, furnishing groups as follows: Roots, Rhizomes, Tubers, Bulbs, Stems, Woods, Barks, Leaves and Leaflets, Herbs, Flowers and Parts of Flowers, Fruits and Parts of Fruits, Seeds, Cellular Drugs not easily recognized as parts of plants, Drugs destitute of Cellular Tissue, &c., closing with a chapter upon Animal drugs.

Tables.—Two tables complete the work; one of the Alkaloids and one of the Antidotes and Incompatibles.

It may be said of the former, it contains all of the officinal and most of the prominent alkaloids, and gives in a tabular form many interesting points concerning them not heretofore mentioned.

Design of the Work.—It is intended, by a careful and instructive classification, to mark out the ground and to *display* the subject in as condensed a form as possible, in order to facilitate and make plain this otherwise tedious and difficult subject. Yet, it is a comprehensive treatise; while unnecessary detail is scrupulously avoided, no want of clearness of expression or meaning is felt by the reader. It will at once be noticed upon examination, that it is vastly different from any of the present works upon the subject—the Dispensatory, for instance, where the subjects are arranged in an alphabetical order. The subjects, on the contrary, are *mapped out for study*, so that by a mere knowledge acquired of the *classification*, a good idea of the whole subject is obtained. The plan of grouping together the principal features of the drug, and subdividing them on scientific methods, not only brings into view all its relations, but it assumes an instructive and interesting aspect, and the memory is supplied with many aids and landmarks.

PUBLISHED AND FOR SALE BY

D. G. BRINTON, 115 South Seventh St., Philad'a.

THE MEDICAL REGISTER AND DIRECTORY

OF THE

UNITED STATES,

SYSTEMATICALLY ARRANGED BY STATES:

COMPRISING

NAMES, POST-OFFICE ADDRESS, EDUCATIONAL AND PROFESSIONAL STATISTICS, OF MORE THAN 60,000 PHYSICIANS, WITH LISTS OF MEDICAL SOCIETIES, COLLEGES, HOSPITALS, AND OTHER MEDICAL INSTITUTIONS, WITH ABSTRACTS, OF THE MEDICAL LAWS OF EACH STATE, NOTES OF MINERAL SPRINGS Etc.

BY

SAMUEL W. BUTLER, M. D.

SECOND EDITION, REVISED AND CORRECTED.

One Volume, large octavo, double columns, 874 pages. Price, Cloth, $5.50; Leather, $6.50.

The **SECOND EDITION** of this important work has been prepared at great cost of time and money. The lists have been carefully revised *by leading men in each State.* Nearly TEN THOUSAND new names have been added, and numerous corrections made. Those who have purchased the first edition will find this one to possess *all the value of a new work.*

This work has a *national* and *historic* value, as well as a present *business* one. Besides the names and addresses of all the physicians in the country, it contains the roster of the medical officers in the Army and Navy, list of the officers of State and County medical societies, a sketch of the medical geography of each State and Territory, analysis of the waters of all prominent mineral springs, and a mass of other information interesting to the profession. The collation of the *laws regulating the practice of medicine* in the various States is a feature of special interest and one not to be found in any other publication.

All who desire to reach medical men for business purposes, for instance, Life Insurance Companies, Medical Colleges, Wholesale Druggists, Importers and Manufacturers of Pharmaceutical Specialties, Dealers in Surgical Instruments, will find this book invaluable.

OPINIONS OF THE PRESS.

From the (London) *Lancet.*
This is the first work of the kind that has ever appeared on the other side of the Atlantic. The Editor and Compiler, Dr. S. W. Butler, and the publisher, are to be congratulated upon an undoubted success.

From the (London) *Medical Press and Circular:*
Upon opening its well-filled and well arranged pages our only surprise is that such a go-ahead race as our cousins have the credit of being, should have gone on so long without so valuable a book of reference.

From the (Philadelphia) *Medical Times:*
To publishers druggists and those members of the profession whose sympathies and needs are wide enough to reach beyond their own immediate neighborhood, this book must be invaluable.

From the (Cincinnati) *Lancet and Observer:*
Of very great value, and will be to physicians what the city directory is to the man of business, a book he cannot get along very well without.

From the *Medical and Surgical Reporter:*
A volume of very considerable importance, the appreciation of which must grow in time, and it should find a place in every medical library of any pretensions of completeness.

Published by D. G. BRINTON,

115 South Seventh Street, Philadelphia.

SCOTT'S EMULSION

PURE COD LIVER OIL

WITH

HYPOPHOSPHITES OF LIME AND SODA

PERFECT, PERMANENT, PALATABLE.

We respectfully ask the Medical Profession to give the above preparation a trial, knowing they will find it just the thing long desired, and obtain splendid results in the wasting diseases indicated by malnutrition and assimilation. The *perfect* and *permanent* union of the Cod Liver Oil with the Hypophosphites, and the thorough manner in which the nauseous taste is disguised, renders it so palatable that the most delicate stomach can retain it. The notable advantage it possesses over all other preparations, is its *permanency* as an *emulsion*, remaining for an almost unlimited time without the slightest separation or change, which enables the Physician always to prescribe it in its proper proportions. The oil is prepared expressly for us, and guaranteed strictly pure. We will gladly furnish, express paid, a 4-oz. sample to any Physician in the country who may not have been supplied.

Formula.—50 per cent. of pure Cod Liver Oil, 6 grs. of the Hypophosphite of Lime, and 3 grs. of the Hypophosphite of Soda to a fluid ounce.

SCOTT & BOWNE,
Manufacturing Chemists, 125 Hudson Street, N. Y.

Messrs. Scott & Bowne: NEW YORK, September 4, 1876.

Gents—I have prescribed Scott's Emulsion of Cod Liver Oil with Hypophosphites in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather, and is more palatable than any other preparation of oil that I have used.

Yours, very respectfully,
ROBERT WATTS, M.D., President Medical Board, Charity Hospital.

Messrs. Scott & Bowne:

Gentlemen—Having given your Emulsion of Cod Liver Oil and Hypophosphites of Lime and Soda a fair trial during the past eighteen months, am very much pleased with the same, and consider it the best preparation of the kind in the market.

Yours, truly,
J. H. HARTMAN, M.D., Baltimore, Md.

We also refer to the following Physicians, who use it and recommend it to the Profession:

G. C. SHATTUCK, M.D., 18 Stamford Street (Late Visiting Physician, Mass. General Hospital).
J. AYER, M.D., No. 6 Hancock Street, Boston.
G. W. GAY, M.D., 575 Tremont Street (Visiting Surgeon Boston City Hospital).
F. E. BUNDY, M.D., 99 Waltham Street, Boston.
W. B. MACKIE, M.D., 675 Tremont Street, Boston.
J. A. OCTERLONY, M.D., Louisville, Ky.
J. SIMONAUD, M.D., New Orleans.
G. LANE TANEYHILL, M.D., Baltimore.
EDWARD A. MARIS, M.D., Baltimore.

NOW IS THE TIME TO SUBSCRIBE

— FOR THE —

Cincinnati Lancet and Clinic,

THE LEADING WESTERN MEDICAL JOURNAL.

It has an able Corps of Contributors; Gives a Condensed Statement of the Progress of Medicine and Surgery; Reviews the Latest Medical Works; Publishes Society Proceedings, and keeps its Readers informed of the Medical News of the Day.

THE CINCINNATI LANCET AND CLINIC is issued *every Saturday*, and contains 20 large octavo double-columned pages of reading matter in every number, and is handsomely printed on fine tinted book paper, neither labor nor expense being spared to adapt it to the daily wants of the American practitioner of Medicine.

THE LANCET AND CLINIC is strictly an independent journal, not being controlled or published in the special interest of any College or Society, but is devoted to the advancement of science and progress of rational Medicine.

SPECIAL INDUCEMENTS.

NEW SUBSCRIBERS, who remit their names and subscription AT ONCE, will receive THE LANCET AND CLINIC from NOW until December 31, 1879,

FOR $3.50.

Address all communications to

Dr. J. C. CULBERTSON,

LONDON MF'G CO.'S ESSENCES OF MEATS

FOR INVALIDS, INFANTS AND TRAVELERS.

ESSENCE OF BEEF, MUTTON, CHICKEN.

These Essences are the finest juices from choice meats, entirely free from fatty or injurious matter. They retain the fine flavor and smell of the meats. Are heavy liquids in a warm temperature and when placed upon Ice take a jelly form especially grateful to invalids. Children will readily take them, and in many of their complaints Essences are unequaled. Being used **WITHOUT WATER,** *they do not cause nausea as does Beef Tea, and they will remain upon the stomach when all other nourishment is rejected. In mental or physical prostration they act as strong stimulants, without the subsequent injurious effects produced by alcohol. In Dyspepsia and all Chronic Diseases of the Stomach, they are easily assimilated and are helpful in Consumption and other wasting diseases. Natural, pleasant and refreshing in fevers. Afford concentrated meat stimulant after child-birth. Are convenient for persons boarding or traveling.*

Taken cold direct from the can, needing no preparation whatever.

Sold by Druggists and Fine Grocers.

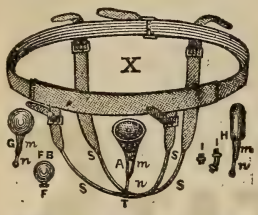
STAUFER'S
HARD RUBBER INSTRUMENTS AND PRICE LIST.

SERIES OF UTERINE SUPPORTERS.

1.



Spring Stem Cup A.—Complete on Belt X, $7.00; on XX, $9.00; on Y, $8.00; and on Z, $6 00. Without belt on SS, $5.00.

Anteversion C, Globe Top G, and Oblong H, in price the same as A, with similar attachments.

Retroversion E, on Belt X, $8 00; on XX, $10.00; on Y, $9 00; and on Z $7.00. Without Belt $6.00

Duplicate Cups—A, $2.00; E, 3 00; Globe Tops G, with attachments to screw on A or E Stem $2.00.

P. S.—Shifting Top, with solid or no Spring Stem, 50 cents less on either belt. No Shifting Top Stem sold alone.

Self-Sustaining Globe B, or Cup D, $1.50 each.

Gums are mailed, 2 at 20 cts; 4 at 35 cts; and Springs at 3 cts. each.

Abdominal Supporters:

2.

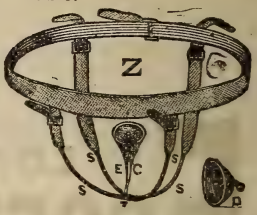
Price, $4.00.

3.

Price, $3.00.

SOLID STEM CUP SUPPORTER

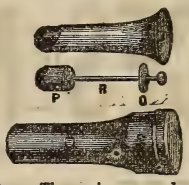
E. C, *5.*



Price, $4.50. Including Cup D, $6.00. Or E C, on Abdominal Belt X, $5.50. X X, $7.50. Y, $6.50. Including D, on each, $1.50 extra.

SPECULUMS AND CASE.

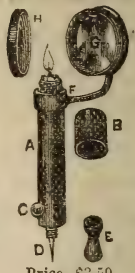
6.



Prices.—The series encased, $14.00. With complete but non-shifting conductor, $2.50 each. Flesh color enameled inside.

REFLECTOR, OR DENTISTS' LIGHT.

10.



Price, $3.50.

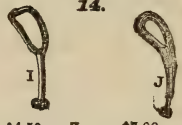
Rectum Supporter and Ointment Holder.

4.

$3.50.

STEM LEVERS.

14.



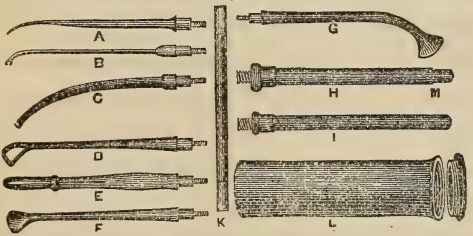
$4.50 on Z, $7.00 on X.

Permanent Stem I—The same in price as E C, Fig. 5, on all the belts.

Spring Stem J—The same as Spring Stem Cup A, Fig. 1, on either belt.

HARD RUBBER UTERINE EXAMINING CASE.

12.



Prices.—Full case, $8.00; Quill Caustic holder H, or camel hair brush holder and case I, each $1.00. Any two of the first seven, with centre piece K, $2.50.

Fenestrated Vaginal and Anal.

7.

Prices.—Vaginal T, $2.00. Anal U, $1.50.

Caustic Bottle and Case.

11.

Price, $1.50.

Hymen—Pointed.

8.

Price, $1.50.

Vaginal and Vulva Dilator.

9.

Price, $1.50.

STAUFER'S NON-EVAPORATING INKSTAND.

Price, $1.00.

15.

13.

Supporters E. C. or Economy.—Fig 5, on its elastic belt Z, is the least in price, and by the oblique construction of the cup sets direct within the angle of the uterus and vagina, (well seen by IU. Fig. 13) If properly selected, or made so by the exchange privilege, (which admits the interchange of all the hard rubber parts in the catalogue, to cover the purchaser's risk.) It is warranted to correct and sustain even any *Procidentia.* The spring stems and shifting tops with their supplements, Fig. 1. Also, improved ***Retroversion, Cup E. Anterversion C.*** and ***Intra-Uterine Stem Cup, I U,*** Fig. 13. The stem locks in a square socket after the cup is in position, and is supported on the elastic gums SS, as A Fig. 1, and same in price Stem Levers, Fig. 14, etc. All are fully explained in the catalogue. The ***Series*** comprises upwards of 150 in style and size instruments, of which two-thirds belong to the support and correction of the uterus. ***Speculums***—Thomas' objections p. 67—'76, are by them completely overcome. The case contains four. The clear and large view, and facility to work through them, far exceeds any other. The ***Ex. Case,*** and physician's favorite, is admirably represented by Fig. 12—weight but 4 oz. ***Catalogue*** sent free on application. In addition to the description of the above series of instruments, it contains important information on this line of treatment.

Obtained through this Office (Med. and Surg. Reporter.)

MAILED ON RECEIPT OF PRICES.

STAUFER'S
SERIES OF HARD RUBBER UTERINE SUPPORTERS.

Fig. 1 from Paragraph 1 to 10.

1. Improvements—*a.* The Spring Stem Supporters are now sustained by double elastic gums S S, separating both anteriorly and posteriorly after passing through the base T. These gums are furnished to order of more than ordinary strength, when required as in some cases of long standing Procidentia. *b.* The tops C, are of increased volume, hollow and light. *c.* Upon the stems (*m n*) of Spring Cups A, and E, may now duplicates C, or small globes G, be used. Thus on stems A, do work tops A, C, E, or G; the C, and G, by the attachments H. *d.* An additional belt XX. *e.* belt Y, improved. *f.* Retroversion correction through the rectum. *g.* Stem Levers.

2. Tops and Springs.—Each design has numerous sizes. They all unscrew, giving access to the coil spring concealed in tube (*m*). The spring prevents the shock when the base T, is accidentally struck, and together with the elastic gums SS, give the Supported Uterus a double rocking motion.

3. Spring Stem Cup A.—This corrects *Prolapsus* and *Procidenia* and the immobility of the Uterus, unless locked by tumors. This immobility may be diagnosed with certainty by the hard rubber speculums or Lever G, in Examining Case. Another proof of its existence is that when the stem will protrude, at first, and the elevation gradually takes place. In such all self-sustaining instruments are powerless.

4. Globe B.—This is a self-sustaining Hard Rubber Shell, with a cord attached for ready removal, and guarding against loosing. When this can be effectually used of a small size, it is a simple and an admirable support. But when the immobility of the Uterus is known to exist, it is in vain to try any self-sustaining instrument. Plugging up the vagina with a light large size ball usually succeeds in *Procidentia*. But it is not altogether commendable, since it must lie where contraction should take place. The stem supporters should therefore have the preferance. *Procidentia* is the simplest of all displacements to correct, notwithstanding the many and cruel operations still performed.

5. Anteversion C.—This top is of the form of a chestnut. It has no advantage over the globe top, except that in some cases it may retain its position better. The latest experience proves, that when the Uterus is properly carried up with the Stem Cup A, or E C, that the Anteversion in common surrenders. Such is frequently the case in Retroversion. It only requires to place the body in such a position before the cup is fully moved up, that the intestines gravitate in position, and the fundus will follow. Rigid flexions are however exceptions.

6. Fast-handle Cup D.—This is also self-sustaining, when capped over the cervix of a well-fitting size. The brim constitutes a ring, which lodges in the folds of the Vagina, and prevents the Uterus from sliding down.

7. Retroversion E.—This is similar to A, except the *Lever Back*. This elevates and corrects the Retroverted Uterus with certainty. But sometimes the sensitiveness will not tolerate the correction and elevation simultaneous. Hence the advantage of the duplicate tops as a change. Retroversion, the most lamentable of all displacements, when traced in common, is found to proceed from long standing, relapsed, or neglected *Prolapsus*.

8. F's—These are small attachments to cover the screws of Cups A, or E, and Globes G, to make them self-sustaining, as a change or when sufficient contraction of the walls of the Vagina takes place to suspense with the external support.

9. Globe Tops G.—These are used in *Anteversion* and *Retroversion* of small sizes; for the latter with longer stems. In Prolapsus, when immobility of the Uterus exists, they are apt to lodge by the side of the Cervix, rather than dislodge it from its unnatural position. No instrument has ever revealed the necessity of a cup and external attachment in so many cases as this.

10. Oblong H.—This was originally designed for the aged and debilitated, since, it is easier to remove and replace than any of the other stem supporters, unless it be the stem lever. It is however confirmed by experience that it is well adapted to the *Prolapsus of the Bladder*. The base of the bulb resists the protrusion while the top rests in the summit of the vagina, and corrects the always attending abnormity of the uterus and its connections, by elongating the vaginia.

11. Stem Levers, Fig. 14.—The original Hodge's Lever, or its modifications, are still recommended by some of the latest authorities, but no modification has removed its liability of becoming displaced. The circular walls of the vagina cannot grasp and hold an irregular and unequally touching instrument, unless it is wedged in position, which is contrary to the laws of nature. This stem lever lodges with the curve against the rear of the cervix; according to Hodge's Original design. A free movable size can be selected, and the natural contractions of the vagina are not impeded, but stimulated by elongation.

12. Uterine Supporter E C, Fig. 5—(*Economy*) and elastic abdominal belt Z. The stems are permanent, but the cups of numerous sizes. The cup sets oblique so that the axis of the cup and stem correspond with the axis of the Uterus and Vagina. The omission of the spring is considered by some over-balanced by its complete simplicity. But the self-sustaining cup A D, is a material loss, unless cup D, is also procured. The unscrewing and shifting is thus obviated, and when D, is of a slight increase in size the external support may sooner and more safely be laid aside.

13. Economy.—A womb supporter, with the free exchange privilege of the Hard Rubber part until correct, and warranted to sustain comfortably even already long standing ***Procidenta,*** for $4 50; including the chief of all self-sustaining pessaries, for $6 00, has no parallel in the catalogue of mechanical support of the uterus.

14. Retroversion and Rectum Supporter. Fig. 4.—F, is the rectum supporter. The bulb A, is hollow, and opened by unscrewing cap B. This may be filled with ointment for lubricating the rectum and to prevent the stem from becoming dry and hot. Impregnating the ointment with Monsell's Solution, to arrest the bleeding of piles. C, represents the base of the screw by which a piston is moved within the bulb while in position, and the ointment pressed out. G, the retroversion lever, is screwed on top in place of B.

BELTS.

15. Belt X—Fig. 1. The anterior portion is silk elastic, expanding and contracting within a cover. Duplicate. Price, $2 00.

16. Belt XX—Fig. 2. The front is strong silk elastic, capped above the pubes to grasp the Abdomen. Stayed with whalebones. The sides and rear are divided to admit the lower portion to be drawn tightest. Both X, and XX, are coutil finished.

17. Belt Y.—Fig. 3. This is a well-fitted coutil belt, stayed with whalebones, and the straps over the hips are elastic. This is also furnished in neat cotton material, at $2 00; or with the instruments, in price as with belt X. This is the first design of an abdominal supporting belt sufficiently economical for all classes, that I with justice could recommend.

18. Belts—Both X X, and Y, are cheap and efficient abdominal supporters when required in pregnancy, tumors, inflation, or when varicose veins exist. When ordered with the instruments, will be provided with the necessary attachments. They should not be bare-worn, since the perspiration has a tendency to destroy the elasticity of any elastic webbing.

19. Belt Z.—Fig. 5. This is an elastic webbing of two inches wide. Both belts X, an Z, set above the hips, and support the instruments only. In some cases the lifting of the abdomen takes weight from the internal support, and assists it materialy; whereas, in others it has a reverse action. I know of no rule to diagnose this variation.

20. Selection—The outside diameter of the cup; diameter of the globe, &c., should be given; the style and length of belt; the measure to be taken around the waist for X, and Z. Over the hips for X X, and Y. When the selection in part or wholly is left to me, the case should be described as follows:—How displaced? Age, and how long standing? If children how many? State of catamenia now and heretofore. Whether it be the result of an accident or unknown cause? When a pessary already worn, its name, size and result If retroversion, the condition as regards helplessness, &c.

21. Exchanges.—The Hard Rubber part has a free exchange privilege in size or style, until correct. The difference to be remitted when more costly ones are required. The duplicate tops, also B, and D, are taken back at cost in exchange for a complete set unless damaged. No spring working stems, however, are sold alone to supply duplicates.

THE WEEKLY
MEDICAL AND SURGICAL REPORTER.

The Medical and Surgical Reporter has been established over thirty years, and has, it is believed, a *bonâ fide* subscription list unsurpassed by any medical weekly in America.

It is issued every Saturday, neatly cut and bound, and gives 24 large octavo, doubled-columned pages of reading matter in each number. It claims the following

SPECIAL FEATURES:

IT IS INDEPENDENT, being controlled by no clique, college, society or publishing house.

COSMOPOLITAN. Having subscribers and contributors in every State in the Union, it is edited in the interest of the *whole profession*, not of one section or locality.

EMINENTLY PRACTICAL. Special prominence is given to Diagnosis and Therapeutics—the *recognition* and the *treatment* of disease, the real *business* of the professional man.

UNSURPASSED IN CHEAPNESS. When the *size* and *number* of its pages, and its frequency of issue are taken into account, it gives more matter for the money than any other medical journal in this country.

PARTICULARLY SUITED TO COUNTRY PHYSICIANS. It has always been a special aim of the editor to furnish a journal that would keep a reader remote from medical centres *fully up to the times* in his profession. Every surgical invention and new remedy of value, every medical book of moment, every professional discussion or news item of interest, will be found recorded in its pages. *Contributions* from country physicians are always welcome.

THE HALF-YEARLY COMPENDIUM

Appears on January 1st and July 1st of each year, forming two semi-annual volumes of 300 large octavo pages each, with complete Index. It has been established ten years, with a constantly growing circulation.

☞ While complete in itself, it is also intended as a **Companion Journal to the Medical and Surgical Reporter**; it is made up from articles *which have not been included* in the latter. The one journal is the Complement of the other.

From 600 to 700 separate articles appear each year in its various departments, carefully prepared, and giving the choicest selections from all sources, American and Foreign. It is the *only* work of the kind which does justice to *American* writers in medicine.

Of the finest quality and most approved patterns.

Orders from Country Physicians will receive particular attention. 1035-tf

NEW BOOKS.

JUST PUBLISHED.

Napheys. *Medical Therapeutics.* Sixth edition (1879), 607 pp. Price, cloth, $4.00, leather, $5.00.

This sixth edition has been thoroughly revised, as may be judged from the fact that the Index of Authors contains 188 names not in former editions. A number of new articles have been added, and even those having former issues of the work will find this edition a valuable investment.

Hall, F. De Havilland. *Differential Diagnosis.* A Manual of the Comparative Semeiology of the more important Diseases. 1 vol., square 8vo., pp. 205, cloth. Price $2.00

The author, Dr. Hall, is an eminent London physician and clinical teacher. The *British Medical Journal* says of his book: "It does not partake of the objectionable type of books brought out by 'grinders;' it is an invaluable aid by the bedside, enabling the practitioner and student readily to compare signs met with in disease with those observed in health." An eminent Indiana physician writes: "The Diagnosis is received; I am *immensely* pleased with it."

Sayre, L. E. *Organic Materia Medica and Pharmacal Botany.* 8vo., pp. 220. Price $2.00.

This is a conspectus of the vegetable and animal drugs, including all the officinal and all the new non-officinal preparations. Brief, clear and cheap, it is just the book to post one's self on medical botany and "new remedies." There are charts of botanic materia medica; geographical grouping of plants; table of alkaloids with source, and doses (very complete, and not to be found in any other work); table of antidotes and incompatibles, etc.

Anderson, W. A. *Self-Copying Prescription Record.* Price 50 cts. Three for $1.00.

These records are books of prescription blanks, with carbon paper, case, etc., so arranged that a copy of a prescription is made when it is written; the original is sent to the druggist, the copy retained; and thus, without the slightest trouble, the physician has a record of all his professional work. Wherever used, they have been much liked.

Landolt, E. *A Manual of Examination of the Eyes.* Translated by Dr. Swan M. Burnett. 1 vol., cloth, pp. 250. Price $2.50.

Dr. Landolt is director in the Ophthalmological Laboratory at the Sorbonne, Paris, and his treatise on the Diagnosis of the diseases of the eye has been most favorably received in Europe. The translator, Dr. Burnett, is well known as an ophthalmologist in this country.

☞Any of the above works will be sent, postpaid, by the publisher, on receipt of the price; or they can be ordered through booksellers.

D. G. BRINTON,

115 S. 7th St., PHILADELPHIA.

AN OPENING FOR A PHYSICIAN.—AN opportunity is offered to an enterprising and competent physician who wishes to invest his means to good advantage and assist in a first-class sanatory and medical institution, indorsed by many prominent men of the regular medical profession, and situated in a healthful and one of the most desirable localities in the country. Business cash, with no night nor out-door practice. A full investigation invited. To the right man a good chance will be offered. No one need apply who cannot furnish valid evidences of integrity and high moral character. Please state experience, etc., means available, and give references.

Further particulars given on application.

Address Dr. H. J. W.,
Care MEDICAL AND SURGICAL REPORTER,
1145-1146 115 South 7th St., Philadelphia, Pa.

FOR SALE.—I DESIRE TO SELL MY practice, amounting to from $3500 to $4000. Also House and Lot, Horses, Buggy, and Household Furniture. Goodwill of practice will be sold separate. To a young graduate this is a rare chance, and will be sold cheap, as the subscriber wants to move East. Apply to J. W. Jamison, M.D., Mondamin, Harrison Co., Iowa.
1145-

NOTICE.—A PHYSICIAN HAVING AN average practice of $4000, will sell half to a partner of ability and experience. For further particulars, address "Medical and Surgical Reporter," 115 South 7th Street, Philadelphia, Pa. 1146-1149

WALNUT HILL,

HARTFORD, CONN.

CHARTERED IN 1874.

An Asylum Home for the treatment of *Inebriates* and *Opium Cases.*

Admirably situated, with ample legal powers of control; based on the fact, confirmed by science and experience, that *Inebriety* is both a physical and mental disease, curable as other diseases are, requiring special treatment in asylums, and in all cases relieved and benefited.

A limited number of patients received, and special facilities provided for each case. The objects sought are rest and building up the diseased organism. Among the means employed are, Turkish baths, electricity, tonics, lectures, amusements, and mental diversion, with exact military and hygienic surroundings. For further information address

T. D. CROTHERS, M. D., Superintendent,
1142-1167. Walnut Hill, Hartford, Conn.

TO PHYSICIANS.

—:o:—

In order to facilitate the introduction of the metric system, as well as to furnish a convenient posological table, we have published a Visiting List Dose Book, in which the doses are given both in the metric and in the apothecaries' weights and measures. It is light, and neatly bound in flexible silk covers, so that it may be carried in the visiting list or pocket, without inconvenience. This little book renders the use of the metric system easy and attractive, even to old practitioners. All physicians interested in the advancement of our science are urged to aid us in placing this little book in the hands of the profession, not only by sending for it themselves, but by ordering it for their friends. Sent free on receipt of six cents in postage.

Address, THE METRIC CLUB, 188 Clark Street, Chicago. 1141-1149x

BURN-BRAE,

A PRIVATE HOSPITAL

FOR

MENTAL DISORDERS.

Location beautiful and salubrious. Grounds extensive and handsomely laid out. Distance from Chestnut Street Bridge, Philadelphia, six miles. Access by Baltimore Turnpike, or West Chester and Philadelphia Railroad; nearest station, Oak Lane.

BURN-BRAE accommodates twenty patients of each sex. Though possessing all the safeguards and appliances of a Public Hospital, the arrangements are domestic and familiar. No efforts spared to make the house a comfortable *Home* for its guests.

DEXTRO-QUININE.

Equal to Sulphate of Quinine in the same dose—causes in large doses no cerebral distress nor irritability of the stomach—less than one-half as costly as Sulphate of Quinine.

From recent letters recording CLINICAL EVIDENCE OF THE VALUE OF DEXTRO-QUININE, we extract the following:

Mrs. S., æt. 22, married, no children, brunette, suffering from intermittent fever, first paroxysm Nov. 20th, 6 A.M., again at 4 P.M. Prescribed Cinchonidia sulphate, grs. XXX, chart No. V. One to be taken every two hours.

Nov. 21st. Return of paroxysm at 6 A.M. and 4 P.M. Gave Cinchonidia sulphate, grs. XLV, chart No. V. One to be taken every two hours.

Nov. 23d. Return of paroxysm at same time as on preceding days. Prescribed Dextro-Quinine, grs. XX, chart No. V. One to be taken every two hours. No return of chill since that date, and highly pleased with my experience.

N. H. MANRING, M. D.,
Rigdon, Ind.

Dec. 13th. I have used Dextro-Quinine in two cases of malarial fever complicated with so much irritability of the stomach that Quinine or Cinchonidia could not be given. The Dextro-Quinine was well tolerated by the stomach, and acted precisely like Quinine when given in the same doses.

WM. COMMONS, M. D.,
Union City, Ind.

K&M
One Ounce
DEXTRO-QUININE
"K&M."
COMPOSITION C_{40}. H_{46}. N_4. O_3.
DEXTRO-GYRATE WITH POLARIZED LIGHT.
This article is prepared from commercial purified Chinoidine and consists of the 'Amorphous Quinine' of Liebig or the Dicinchinia of Hesse. It is equal to Sulphate of Quinine in the same dose, while in price it is less than one half as costly.
MANUFACTURED BY
KEASBEY & MATTISON.
CHEMISTS.
PHILADELPHIA, U. S. A.

Price, $1.50 Per Ounce.

Dec. 13th. I am using in the cases of typhoid fever under my charge, your Dextro-Quinine as a substitute for Sulphate of Quinine, in the same doses, and meet with the same effect. I think it an article of *genuine merit.*

D. E. WELLS, M. D.,
Bethlehem, N. H.

Nov. 29th. After using Dextro-Quinine in cases of ague, I deem it equally good, if not preferable to the Quinine Sulphate. Please give me the names of Druggists in St. Louis or Chicago, of whom I can get it.

C. J. RAGLAND, M. D.,
Mulberry Grove, Ill.

Dec. 14th. I have given Dextro-Quinine in two cases of Tertian ague, with the result of promptly arresting the chills. It caused no unpleasant "head symptoms" in either case. The doses were the same as ordinary doses of Quinine. H. A. RODEBAUGH, M. D., Reynoldsburg, O.

Dec. 12th. I find your Dextro-Quinine well tolerated by the stomach, and produces no distress. I think it has the advantage of Sulphate of Quinine in not producing headache and other disagreeable symptoms. L. NEWCOMB, M. D., N. Scituate, Mass.

Dec. 12th. I think the success attending my administration of your Dextro-Quinine in cases of remittent fever justifies me in saying better results could not be obtained with Sulphate of Quinine itself. It has the advantage of Quinine in not affecting the head and being less disagreeable to the palate. JOS. MULLANE, M. D., Lyons, Ind.

DUREL'S
TAR AND IRON SYRUP AND CAPSULES.

PREPARED BY DUREL, PHARMACIST, PARIS.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron is a desideratum which has at last been attained in these preparations. The indications for such a remedy are many, but it has been found especially useful in CHLOROSIS, BRONCHIAL CATARRH, CATARRH OF THE BLADDER, CHRONIC UTERINE DISCHARGES, depending upon an enfeebled or relaxed state of the system.

Sold by Chemists generally.

CRINON'S HÆMOGLOBIN,

The Albuminoid Ferruginous Principle of Blood.

HÆMOGLOBIN is the only physiological chalybeate. Associated as it is with the phosphates of the blood, it forms the most powerful of tonics, and at the same time a most nourishing food. It is especially useful in cases of *Anœmia*, *Chlorosis*, *Cachexias*, *Exhaustion* caused by excess of work, nervous debility, fatigue resulting from parturition and lactation. It replaces entirely liquid blood, which has been recommended and used with success in *Phthisis* and *wasting away*.

It is offered in two forms: In cachets (wafers), 60 of which are contained in a box; combined with chocolate in small squares, 30 of which are in a box; both forms can be sent by mail.

Prepared by C. CRINON, Paris, Pharmacist of the first class, Laureate of the Hospitals of Paris. Samples may be obtained by application to

E. FOUGERA & CO., New York, Agents for the U. S.

FOUGERA'S COMPOUND IODINISED
COD LIVER OIL.

Since the introduction of this oil in 1858, it has been found to be superior to all other kinds of Cod Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod Liver Oil, but also the **tonic, stimulant** and **alterative** properties of **Iodine, Bromine** and **Phosphorus**, which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod Liver Oil.

Through its **increased curative action, FOUGERA'S COD LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod Liver Oil would fail entirely.

FOUGERA'S READY-MADE MUSTARD PLASTERS.

A most useful, convenient, clean, and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths. Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll, of 10 plasters each. DIRECTIONS.—Dip the Plaster, or Plasters, a minute or two, in cold water; apply on the part, and cover with a band.

FOUGERA'S COMPOUND ICELAND MOSS PASTE.

(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, etc.

Wakefulness, Cough, and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this Paste.

FOUGERA'S IODO-FERRO-PHOSPHATED ELIXIR OF HORSE-RADISH.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of antiscorbutic and aromatic plants, and acts as a **tonic, stimulant, emmenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

NEW YORK.

PHOSPHOROLE.

PHOSPHORUS and COD-LIVER OIL

have now an established position throughout the civilized world as important therapeutical agents. A *perfect combination* of the two has long been a desideratum, since they are both of value in the same disorders, while the cases in which one is demanded and the other contra-indicated are exceedingly rare.

The combination in PHOSPHOROLE has the twofold advantage of furnishing *the best possible form* for the administration of *phosphorus*, and *a more effective form* for the administration of *cod-liver oil*.

With regard to the former, it has been decided by the highest chemical and medical authorities that *phosphorus* should be administered *in a free state*, and in a vehicle which ensures its *perfect diffusion*, its *absolute unalterability*, and, as far as possible, its *prompt assimilation* without the gastric irritation to which the ordinary methods of exhibiting the agent give rise. It is well known that pills, emulsions, solutions in ether, chloroform, vegetable oils and resin, etc., have all failed to fulfill one or more of these conditions. Even an ordinary solution of phosphorus in cod-liver oil would not answer the purpose in all respects. We claim, however, that PHOSPHOROLE completely satisfies all the conditions. From the method of preparing it, in an atmosphere of dry carbonic acid, the phosphorus is *entirely dissolved without oxidation*, and by our mode of manipulation *a positive uniformity of strength* is ensured. It is then promptly bottled and sealed, and its *stability and permanence* thus secured. The exact amount of phosphorus in each dose is known, its efficiency is ensured, and the irritant effects upon the stomach are reduced to a minimum by the blandness of the oil. As a means then of administering *phosphorus* in the many cases in which it is indicated as a *nervous tonic and stimulant*, it is claimed that PHOSPHOROLE is the best attainable in the present state of our knowledge.

The value of *cod-liver oil* in phthisis is so familiar to the physician that it is needless to dwell upon it. But the value of *phosphorus* is also universally recognized in this disease, especially when complicated with nervous derangements. The *combination* of the two therefore furnishes a more effective form for the administration of cod-liver oil in the great majority of cases in which that remedy is indicated, and one which will at once commend itself to the profession.

A dose of two teaspoonfuls of PHOSPHOROLE contains $\frac{1}{100}$ of a grain of phosphorus. This dose, when given after a meal, is effective, and not very liable to interfere with digestion. *Phosphorus is cumulative in its action, and should be administered with watchful care.* About $\frac{1}{12}$ grain is considered the largest safe dose, and we rarely need go higher than $\frac{1}{20}$ or $\frac{1}{80}$ of a grain. At the very first appearance of the smallest gastric derangement, the exhibition of phosphorus should be stopped.

PHOSPHOROLE is handsomely put up in pint bottles only, and may be obtained at all first-class druggists throughout the United States.

91 Fulton Street, New York.

CAUTION!!—SPECIFY McKESSON & ROBBINS'.

☞ SUPERIOR TO PEPSIN OF THE HOG.

INGLUVIN

FROM THE

Ventriculus Callosus Gallinaceus.

A specific for VOMITING IN PREGNANCY, a potent and reliable remedy for the cure of INDIGESTION, DYSPEPSIA, and SICK STOMACH, caused from debility of that organ. It is superior to the Pepsin Preparations, since it acts with more certainty, and effects cures where they fail.

"A New Remedy, INGLUVIN."

By A. F. SHELLY, M.D., of Philadelphia.

"This is obtained from the gizzard of the domestic fowl (chicken), and is a *Specific for Vomiting in Pregnancy.* I have used this remedy for twenty-five years, and it has never failed. It is also the most *powerful* and *reliable remedy* for the *Cure* of *Indigestion, Dyspepsia,* and *Sick Stomach,* caused from debility of that organ. It is useful in all cases where pepsines and pancreatines are used, but with much more certainty of good results.

"In complicated affections of the Stomach, such as *Inflammation, Gastralgia, Pyrosis,* etc., it may be combined with Subnitrate of Bismuth and opiates; and in Diarrhœa and Cholera Infantum, with astringents, both vegetable and mineral. I have given the article to several prominent physicians, who have used it with the happiest results, among whom I may mention Prof. E. WALLACE, of the Jefferson Medical College."

AN EFFICIENT REMEDY AND AN AGREEABLE SUBSTITUTE FOR COD LIVER OIL.

PROF. TROUSSEAU'S

CARBONIZED

FRESH MEAT CURE.

Consisting of TENDER, RAW, LEAN BEEF, desiccated in vacuum, combined with CARBON as an antiseptic, and medicated with HYPOPHOSPHITES OF LIME, SODA, and POTASSA with CINCHONA. A medicated, nourishing food, pleasant to take and easily digested, for the cure of

Consumption, Chronic Dysentery, and Exhausted Conditions consequent upon Typhus and Typhoid Fevers, Typhoid Pneumonia, Diphtheria, General Debility, Nervousness, and Prostration from whatever cause.

In presenting this to the Medical Practitioners of the United States, we scarcely deem it necessary to extol a remedy the efficacy of which they must determine by actual trial. We believe, as Pharmaceutical Chemists, that we have overcome a difficulty by making this preparation of fresh meat stable under all circumstances; while, at the same time, it is potent, efficacious, and palatable.

WILLIAM R. WARNER & CO.,

1228 MARKET STREET, PHILADELPHIA,

MANUFACTURERS OF SUGAR-COATED PILLS.

SOLUTION
FERROUS CHLORIDE.

This Solution of Iron is the lowest form of Chloride. It is much less styptic in taste than Tr. Iron Chloride, consequently pleasanter to the patient; it is much more easily assimilated by weak and irritable stomachs.

Knowing how difficult it is to introduce into the blood, in a proper form, a sufficient quantity of iron to be beneficial, we have manufactured and introduce the **Ferrous Chloride** as being easily absorbed and acting with much efficacy, even when given in small doses.

Dr. Rabuteau, who has specially studied the protochloride of iron, and shown that it is the most natural of ferruginous salts, thinks that he has found the very thing required:—

EXTRACT FROM THE REPORTS OF THE ACADEMY OF SCIENCES OF PARIS.
(*Sitting of* 11 *December*, 1871.)

"..... The most important thing is the facility with which the protochloride of iron is absorbed by the stomach. Two or three hours after from 4 to 10 grains of this salt have been ingested, almost the whole is absorbed. Having finally observed that the reduced iron and the ferruginous oxyds and carbonates are changed into protochloride in the stomach by the contact with the hydrochloric acid of the gastric juice, I thought it necessary to substitute this salt for all the preceding for medicinal purposes. My observations in the wards of hospitals and in my own practice have convinced me of the successful results of the protochloride of iron, which is easily borne when pure and administered in a proper way."

For details, see the memoirs on the protochloride of iron published in the *Union Médicale, Paris*, 1871 and 1872.

Each fluid drachm contains two grains of the Anhydrous **Ferrous Chloride.**

APOLLINARIS
NATURAL MINERAL WATER.
HIGHLY EFFERVESCENT.

Approved by the Academy of Medicine of France, and its sale in France authorized by special decree of the French Government.

"THE QUEEN OF TABLE WATERS."—*London Medical Record.*

PROFESSOR OSCAR LIEBREICH, Professor of Medical Chemistry, University of Berlin:—"After minute personal investigation, I can affirm that the Apollinaris Water is bottled according to all the rules of science, and is an entirely Natural Mineral Water."

PROFESSOR J. A. WANKLYN, Lecturer on Chemistry, St. George's Hospital, London:—"I have thoroughly examined the Apollinaris Spring and the method of bottling. The Apollinaris Water, as supplied to the public, is simply and purely a Natural Mineral water, impregnated only with its own gas."

PROFESSOR MOHR, Medical Councilor, University of Bonn:—"After exhaustive investigation, I declare the Apollinaris Water, as supplied to the public, to be purely natural in every respect, and of most excellent quality."

DR. THEODOR KYLL, Analytical Chemist, Town Councilor, Cologne (*expert appointed by United States Vice-Consul, October*, 1877), reported that "The Apollinaris Water, as bottled, deserves in every respect the name of an excellent natural acidulated water."

Every Genuine Bottle bears the REGISTERED YELLOW PICTORIAL LABEL of the Apollinaris Company, Limited, London.

To be had of all Wine Merchants, Grocers, Druggists, and Mineral Water Dealers throughout the United States, and Wholesale of

DUREL'S
TAR AND IRON SYRUP AND CAPSULES.
PREPARED BY DUREL, PHARMACIST, PARIS.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron is a desideratum which has at last been attained in these preparations. The indications for such a remedy are many, but it has been found especially useful in CHLOROSIS, BRONCHIAL CATARRH, CATARRH OF THE BLADDER, CHRONIC UTERINE DISCHARGES, depending upon an enfeebled or relaxed state of the system.

Sold by Chemists generally.

CRINON'S HÆMOGLOBIN,
The Albuminoid Ferruginous Principle of Blood.

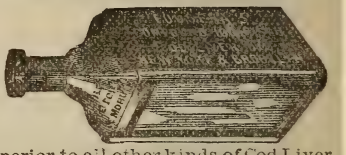
HÆMOGLOBIN is the only physiological chalybeate. Associated as it is with the phosphates of the blood, it forms the most powerful of tonics, and at the same time a most nourishing food. It is especially useful in cases of *Anæmia, Chlorosis, Cachexias, Exhaustion* caused by excess of work, nervous debility, fatigue resulting from parturition and lactation. It replaces entirely liquid blood, which has been recommended and used with success in *Phthisis* and *wasting away.*

It is offered in two forms: In cachets (wafers), 60 of which are contained in a box; combined with chocolate in small squares, 30 of which are in a box; both forms can be sent by mail.

Prepared by C. CRINON, Paris, Pharmacist of the first class, Laureate of the Hospitals of Paris. Samples may be obtained by application to

E. FOUGERA & CO., New York, Agents for the U. S.

FOUGERA'S COMPOUND IODINISED
COD LIVER OIL.



Since the introduction of this oil in 1858, it has been found to be superior to all other kinds of Cod Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod Liver Oil, but also the **tonic, stimulant** and **alterative** properties of **Iodine, Bromine** and **Phosphorus**, which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod Liver Oil.

Through its **increased curative action, FOUGERA'S COD LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod Liver Oil would fail entirely.

FOUGERA'S READY-MADE MUSTARD PLASTERS.

A most useful, convenient, clean, and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths. Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll, of 10 plasters each. DIRECTIONS.—Dip the Plaster, or Plasters, a minute or two, in cold water; apply on the part, and cover with a band.

FOUGERA'S COMPOUND ICELAND MOSS PASTE.
(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, etc.

Wakefulness, Cough, and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this Paste.

FOUGERA'S IODO-FERRO-PHOSPHATED ELIXIR OF HORSE-RADISH.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of antiscorbutic and aromatic plants, and acts as a **tonic, stimulant, emmenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

VACCINE VIRUS.

In order to meet properly the continued demand upon us for ANIMAL VIRUS, we have established stables for its propagation upon carefully selected heifers. The lymph used is of the well-known "Beaugency" stock, imported by ourselves expressly for this purpose. The result of several years' experience in supplying this lymph leads us to believe that its excellence is unsurpassed. The establishment is under the care of a competent physician, who will spare no pains to produce a perfectly RELIABLE and PURE article, which we are prepared to furnish FRESH, DAILY.

We can also furnish, to those who prefer it, HUMANIZED VIRUS, from healthy children, procured for us by physicians of undoubted reliability.

All our Virus is put up in strong, *air-tight, sealed packages*, for safe conveyance by mail or express, and will be sent (post-paid if by mail) upon the following terms:—

From the Heifer, 10 large Ivory Points, well charged on both sides	$1.50
5 large Ivory Points, " " "	.80
Large Ivory Points, less than 5, " " " each	.25
1 Crust, new method, in air-tight Glass Capsule	2.00
From Healthy Infants, 10 small Ivory Points	1.50
1 Crust from Unruptured Vesicles	2.00

Directions for vaccinating with either form of Virus, derived from methods successfully employed, will be furnished with Virus if requested.

We will warrant every package of Points and every Crust, giving a fresh supply in case of failure reported within fifteen days for Points, thirty days for Human, and ninety days for Kine Crusts. We can usually furnish Crusts one remove from the heifer, if preferred.

On account of their unreliability, we have hitherto furnished the usual form of Kine Crust unwillingly. Under our new method of taking and preserving them, however, after careful tests and an experience extending over several months, the results attained have been so satisfactory that we now offer them as not less active and reliable than other forms of Virus, while less liable to become inert with lapse of time. We now offer them on very favorable terms, and recommend them for transmission to a distance, and in all cases where it is desired to preserve Virus for some weeks or months, or to keep a supply at hand for emergencies.

We also furnish UNCHARGED IVORY POINTS, for physicians' use, at the following rates:—

Small	per 100, 25 cents;	per 1000 2.00
Large	per 100, 50 cents;	per 1000 4.00

Orders by mail or telegraph answered by return train.

Liberal discounts upon large supplies for Cities, Towns, and Institutions.

SCARIFYING VACCINATOR, STEEL, NICKEL PLATED. See Cut. Each 25 cents.

TROMMER'S EXTRACT OF MALT.

The rapidly increasing demand for our IMPROVED EXTRACT OF MALT, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantities; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or moulding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expense of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops**, viz: MALT SUGAR, DEXTRINE, DIASTASE, RESIN and BITTER of HOPS, PHOSPHATES of LIME and MAGNESIA, and ALKALINE SALTS.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:—
Malt Sugar 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712. Alkalies .377; Water, 25.7; Total, 99.958.
In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article.

Yours truly, SILAS H. DOUGLAS,
Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt contains a larger quantity of the active properties of Malt than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ pounds of the Extract.

Our preparations of Malt are for sale by druggists generally, throughout the United States and Canada, at the following prices:—

EXTRACT OF MALT,			*With Hops (Plain)*,	$1.00
"	"	"	*Pyrophosphate of Iron (Ferrated)*,	1.00
"	"	"	*Cod Liver Oil*,	1.00
"	"	"	*Cod Liver Oil and Iodide of Iron*,	1.00
"	"	"	*Cod Liver Oil and Phosphorus*,	1.00
"	"	"	*Hypophosphites*,	1.50
"	"	"	*Iodides*,	1.50
"	"	"	*Alteratives*,	1.50
"	"	"	*Citrate of Iron and Quinia*,	1.50

LIGHT-BROWN
COD LIVER OIL

SELECT MEDICAL OPINIONS.

Sir HENRY MARSH, Bart., M.D., T.C.D.,
Physician in Ordinary to the Queen, in Ireland.

"I have frequently prescribed Dr. De Jongh's Light-Brown Cod-Liver Oil. I consider it to be a very pure oil, not likely to create disgust, and a therapeutic agent of great value."

Dr. JONATHAN PEREIRA, F.R.S.,
Author of
"The Elements of Materia Medica and Therapeutics."

"It was fitting that the author of the best analysis and investigations into the properties of Cod-Liver Oil should himself be the purveyor of this important medicine. I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, *whom I regard as the highest authority on the subject.* The Oil is of the very finest quality, whether considered with reference to its color, flavor, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured."

Dr. EDWARD SMITH, F.R.S.,
Medical Officer to the Poor-Law Board of Great Britain.

"We think it a great advantage that there is one kind of Cod-Liver Oil which is universally admitted to be genuine—the Light-Brown Oil supplied by Dr. De Jongh. It has long been our practice, when prescribing the Oil, to recommend this kind, since, amidst so much variety and uncertainty, we have confidence in its genuineness."—(Extract from "Consumption: Its Early and Remediable Stages.")

Dr. PROSSER JAMES,
Lecturer on Materia Medica and Therapeutics at the London Hospital.

"I have always recognized your treatise on Cod-Liver Oil as the best on the subject, and adopted its conclusion as to the superiority of the Light-Brown over the Pale Oil. I have the less hesitation in expressing myself in this sense since I am only endorsing the opinion sent to you more than twenty years ago by Dr. Pereira, my illustrious predecessor in the chair of Materia Medica at the London Hospital."

Sir G. DUNCAN GIBB, Bart., M.D., LL.D.,
Physician and Lecturer on Forensic Medicine, Westminster Hospital.

"The experience of many years has abundantly proved the truth of every word said in favor of Dr. De Jongh's Light-Brown Cod-Liver Oil by many of our first Physicians and Chemists, thus stamping him as a high authority and an able Chemist, whose investigations have remained unquestioned."

Dr. LETHEBY,
Medical Officer of Health, and Chief Analyst to the City of London.

"In all cases I have found Dr. De Jongh's Light-Brown Cod-Liver Oil possessing the same set of properties, among which the presence of cholaic compounds, and of iodine in a state of organic combination, are the most remarkable. It is, I believe, universally acknowledged that this Oil has great therapeutic power; and, from my investigations, I have no doubt of its being a pure and unadulterated article."

Dr. BANKS,
King's Professor of the Practice of Physic at the University of Dublin.

"I have, in the course of my practice, extensively employed Dr. De Jongh's Light-Brown Cod-Liver Oil, and I have no hesitation in stating that I consider it the best of all the specimens of oil which have ever come under my notice. The fact of so able and accurate an observer as Dr. De Jongh subjecting the Oil to careful analysis previous to its exposure to sale, is a sufficient guarantee of its purity and excellence."

Dr. EDGAR SHEPPARD,
Professor of Psychological Medicine, King's College, London.

"Dr. Sheppard has made extensive use of Dr. De Jongh's Light-Brown Cod-Liver Oil, and has great pleasure in testifying to its superiority over every other preparation to be met with in this country. It has the rare excellence of being well borne and assimilated by stomachs which reject the ordinary Oils."

DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL is supplied ONLY in bottles sealed with BETT'S Patent Capsule, impressed on the top with Dr. DE JONGH'S Stamp, and on the side with his Signature, and the Signature of ANSAR, HARFORD & CO., and bearing under the wrapper a Label with the same Stamp and Signatures. WITHOUT THESE MARKS NONE CAN POSSIBLY BE GENUINE.

CONSPECTUS

OF

ORGANIC MATERIA MEDICA

AND

PHARMACAL BOTANY,

COMPRISING

THE VEGETABLE AND ANIMAL DRUGS, THEIR PHYSICAL CHARACTER, GEOGRAPHICAL ORIGIN, CLASSIFICATION, CONSTITUENTS, DOSES, ADULTERATIONS, &c.,

By L. E. SAYRE, PH.G.

1 Vol. 8vo., pp. 220, with Folding Tables. Price, in Cloth, by mail, post paid, $2.00.

PLAN OF THE WORK.

The Chart.—In the space of seventeen of the first pages is found the whole Materia Medica, arranged according to Natural Orders. Every drug is mentioned. Opposite the column of drugs are arranged in a tabular manner all the following points concerning it: Officinal Name, Botanical Name, Common Name, Habitat, Part Used, Constituents, Medical Properties, Dose, Officinal Preparations; making in all 10 columns, supplying the place of the cumbrous broadsides heretofore in use for this purpose.

Geographical Grouping of Drugs.—This comprises three pages, giving the characteristic drugs derived from different sections of the world.

Botany.—This subject is treated as an introduction to other and more voluminous treatises, under the following heads:—The Cell, Cell Modification, Tissues, Cell Development, Contents of Cells; The Stem, Subterranean Stems, Leaves Flowers, Fruits and Seeds. The arrangement and display of the material is such that it will rather fascinate than tire the student. The botanical terms are, in every case, made clear by definition, so that they are readily comprehended.

Natural Orders.—This chapter opens with a general treatise upon the subject, followed by a tabular arrangement of the principal natural orders. The most prominent characteristics of these and their sub-orders are brought out unencumbered with such detail as a manual of botany would give, thus furnishing points to refresh the memory, and giving an appropriate outline for the beginner.

Drugs—Their Characteristics, Constituents, &c., &c.—This subject occupies the body of the work. In one hundred and fifty pages are embraced not only all the drugs which are officinal in the U. S. P., but others of any prominence, especially those recently brought into favor. They are arranged according to their physical characteristics, thus bringing together the various parts of the plants, furnishing groups as follows: Roots, Rhizomes, Tubers, Bulbs, Stems, Woods, Barks, Leaves and Leaflets, Herbs, Flowers and Parts of Flowers, Fruits and Parts of Fruits, Seeds, Cellular Drugs not easily recognized as parts of plants, Drugs destitute of Cellular Tissue, &c., closing with a chapter upon Animal drugs.

Tables.—Two tables complete the work; one of the Alkaloids and one of the Antidotes and Incompatibles.

It may be said of the former, it contains all of the officinal and most of the prominent alkaloids, and gives in a tabular form many interesting points concerning them not heretofore mentioned.

Design of the Work.—It is intended, by a careful and instructive classification, to mark out the ground and to *display* the subject in as condensed a form as possible, in order to facilitate and make plain this otherwise tedious and difficult subject. Yet, it is a comprehensive treatise; while unnecessary detail is scrupulously avoided, no want of clearness of expression or meaning is felt by the reader. It will at once be noticed upon examination, that it is vastly different from any of the present works upon the subject—the Dispensatory, for instance, where the subjects are arranged in an alphabetical order. The subjects, on the contrary, are *mapped out for study*, so that by a mere knowledge acquired of the *classification*, a good idea of the whole subject is obtained. The plan of grouping together the principal features of the drug, and subdividing them on scientific methods, not only brings into view all its relations, but it assumes an instructive and interesting aspect, and the memory is supplied with many aids and landmarks.

BETHESDA WATER.

We claim Bethesda to be a specific in all cases of Diabetes, Inflammation of the Kidneys, Inflammation of the Bladder, Inflammation of the Neck of the Bladder and Urethra, Dropsy, Gouty Swellings, Stoppage of Urine, Incontinence of Urine, Albuminuria, Ropy or Cloudy Urine, Brick-dust Deposit, thick, morbid, bilious and dark-appearing Urine, with bone-dust Deposits, burning sensation with sharp pains when voiding the Urine, Hemorrhage of the Kidneys, Pain in the Kidneys and Loins, Torpid Liver, Indigestion, Calculus and Female Weakness.

What the Medical Profession Say.

MILWAUKEE TESTIMONIALS.

(Milwaukee is 20 miles from the Spring.)

What Surgeon-General Wolcott and other prominent medical men say about the Bethesda Water:—

DR. WOLCOTT—Dear Sir: My attention has lately been called to the Bethesda Mineral Water, of Waukesha, as a remedy for Diabetes, Bright's Disease, etc., and I desire, in behalf of an afflicted friend, to ask of you the favor of submitting briefly your views of its merits, or its claims to the confidence of the profession as a medical agent in the maladies named, and you will much oblige, J. W. RIGGS, M.D.

J. W. RIGGS, M.D.—Dear Sir: Many cases of Diabetes and other forms of Urinary Disorders have been cured or greatly relieved by the use of the water; so much so that the Spring has already a wide-spread reputation. What time may do, either in sustaining or destroying this rapidly acquired reputation, remains to be seen. It is a test too severe for most very rapidly famous remedies, but this may, nevertheless, stand it. Very respectfully,

E. B. WOLCOTT, M.D.

Two years after the above was written, Dr. Wolcott says—

I am gratified to find that the opinion given by me over two years ago, on the medical properties of the Bethesda Water, has been fully sustained and confirmed by its use, in a vast number and great variety of cases involving the urinary organs. In many, nay, in most of such cases, I do not hesitate to say that it is vastly superior to any other remedy known to the profession. E. B. WOLCOTT, M.D.

We fully concur in the above.

O. P. WOLCOTT, M.D.
J. E. GARDNER, for diabetes.
H. XELOWSKI, M.D.
J. M. ALLEN, M.D.

What Dr. Thompson (late Surgeon in charge of National Asylum) says about the Bethesda Water:—

I have known many acute and Chronic diseases of the kidneys and urinary organs permanently relieved by the use of Bethesda Spring Water after resisting ordinary medical treatment. I regard the water as possessing remarkable medicinal properties, and have observed its effects for the past two years.

J. H. THOMPSON, M.D,
Late Surgeon in charge National Asylum, 210 Wisconsin street, Milwaukee.

What Dr. Marks (late President Wisconsin Medical Society) says about Bethesda Water:—

During the past two years I have prescribed Bethesda Water for quite a number of patients who were suffering from diabetes, and unhesitatingly pronounce it *the best* remedy I have used for that disease.

S. MARKS, M.D.

THE POST-OFFICE LAWS

Forbid anything of an oleaginous nature being sent through the mail.

THEOPHILUS REDWOOD, Ph.D., F. C. S., Professor of Chemistry and Pharmacy to the Pharmaceutical Society of Great Britain, says, in reference to this preparation:—

"UNGUENTUM PETROLEI appears to be obtained from crude Petroleum by fractional distillation and subsequent purification. Products of a similar description have been introduced in pharmacy, and recommended as substitutes for animal or vegetable fats in the preparation of ointments or liniments.

"Among these the UNGUENTUM PETROLEI is distinguished by its having a firmer consistence and a higher melting point, and in these respects it resembles pure lard, from which it differs in that it is entirely free from liability to become rancid or to undergo any chemical change. It has an amber color, and a smooth, jelly-like appearance and is almost wholly free from odor or taste. It is free from, and insoluble in, water. It is very slightly soluble in rectified spirit, but very soluble in ether, in fixed oils and fats. I am of opinion that its characters and properties are such as to render it a valuable adjunct to our Materia Medica."

Dr. TILBURY FOX, London, writes:—"I like the UNGUENTUM PETROLEI very much indeed, and shall not fail to prescribe it."

From "THE LANCET," London, October 20th, 1878.—"Semi-transparent, pale yellow in color, and perfectly free from offensive smell. We consider it a valuable preparation, and hope its use will become as common in England as it is said to be in America."

From "THE MEDICAL TIMES AND GAZETTE," London, October 20th, 1878.—"The substance introduced under the name of UNGUENTUM PETROLEI is of about the consistence of good lard, has no smell, keeps any length of time, apparently without becoming rancid, and may be exposed to any kind of atmosphere without undergoing chemical change. It has long been, we understand, in use in America, where it enjoys a wide-spread popularity; and it will, we doubt not, come into extensive use here also, as a vehicle for making ointments, as a demulcent in various diseases of the skin, and as a lubricant."

TO THE MEDICAL PROFESSION.

MALTINE.

(Extract of Malted Barley, Wheat & Oats.)

THIS PREPARATION

Contains from three to five times the Medicinal and Nutritive elements found in Extract of Malt.

MALTINE is a highly concentrated extract of malted *Barley*, *Wheat*, and *Oats*, containing, undiminished and unimpaired, all the medicinal and nutritious principles found in these cereals. By the most carefully conducted scientific process we are enabled to offer to the medical profession a perfect article, possessing from *three* to *five times* the therapeutic and nutritive merit of any foreign or domestic Extract of Malt.

In support of our claims we invite the attention of the profession to the following points, viz.:

FIRST.—In the manufacture of **MALTINE** the evaporation necessary to reduce it to its great density is conducted in vacuo, at a temperature ranging from 100° to 120° Fahr.; while most manufacturers of Extract of Malt resort to "open pan" or low pressure steam boiling, by neither of which processes can the extract be so produced as to preserve the Diastase, Phosphates, and Albuminoids, on which its remedial value so greatly depends, and the product is either of a dark color or of low specific gravity, possessing little virtue aside from the saccharine matter which it contains.*

SECOND.—*Carbon*, *Hydrogen*, *Nitrogen*, *Sulphur*, *Iron*, *Magnesium*, and *Potassium*, are essential elements in the food of man, and it is only in **MALTINE**, containing the combined properties of malted *Barley*, *Wheat*, and *Oats*, that all these principles can be found in the proper proportions; Extract of Malt made from *Barley alone* is wanting in some of the most important of these elements.

THIRD.—*Gluten* is the most nutritious principle found in the cereals, and is the only vegetable substance which will, alone, support life for any great length of time. It is composed of three distinct nitrogenous principles, together with fatty and inorganic matters, and is analogous to animal fibrin. **MALTINE** contains twenty times the quantity of *Gluten* found in any Extract of Malt.

FOURTH.—Liebig says, "Wheat and Oats stand first among our list of cereals in combining all the elements in proportions necessary to support animal life. They are especially rich in muscular and fat producing elements." The only reason we use Malted Barley, in the manufacture of **MALTINE**, is that it contains larger proportions of mineral matters (bone producers) and Diastase. It is deficient in all other essential elements.

We believe that any practitioner will readily recognize the superiority of MALTINE, and would request a trial and comparison of merits with any article offered for similar uses.

* As a sure test for Diastase, and the Albuminoids, a small quantity should be put in a test tube or small vial, largely diluted with water, and heated to the boiling point, when the Albumen, if present, will coagulate, and appear in little flocculent particles throughout the liquid. If the extract remains clear, it is proof that it has already been coagulated by excessive heat, and removed by filtration during the process of manufacturing. Any heat which will coagulate Albumen will inevitably destroy the digestive power of Diastase.

The Nitrogenous constituents of *MALTINE* have a composition identical with that of the chief constituents of the Blood, and therefore contain nearly every element requisite for the reproduction of the human body.

MALTINE AND ITS COMPOUNDS

can undoubtedly be used with greater success than any other remedy now known, in cases of general and nervous Debility, Indigestion, imperfect Nutrition and deficient Lactation; Pulmonary affections, such as Phthisis, Coughs, Colds, Hoarseness, Irritation of the Mucous Membranes and difficult expectoration; Cholera Infantum and wasting diseases of children and adults; Convalescence from Fevers, and whenever it is necessary to increase the vital forces and build up the system.

WE MANUFACTURE THE FOLLOWING PREPARATIONS, THE FORMULÆ AND DOSES OF WHICH ARE GIVEN IN OUR DOSE BOOKS, AND ON THE LABEL ATTACHED TO EACH BOTTLE:

MALTINE WITH HOPS.

MALTINE, FERRATED:

This combination is specially indicated in Anæmia and Chlorosis, and in all cases of defective nutrition where Iron is deficient in the system.

MALTINE WITH PHOSPHATES IRON AND QUINIA:

A powerful general and nutritive tonic.

MALTINE WITH PHOSPHATES IRON, QUINIA AND STRYCHNIA:

A powerful nutritive, general and nervous tonic.

MALTINE WITH PEPSIN AND PANCREATINE:

One of the most effective combinations in Dyspepsia, Cholera Infantum, and all diseases resulting from imperfect nutrition. It contains three of the all-important digestive agents, Diastase being one of the constituents of the *MALTINE*. We believe there are few cases of Dyspepsia which will not readily yield to the medicinal properties of the above combination, while the system is invigorated by its nutritive qualities.

MALTINE WITH BEEF AND IRON:

One of the most valuable combinations in cases of General Debility, when there is deficient nutrition and a deficiency of Iron in the system

MALTINE WITH ALTERATIVES:

In this preparation *MALTINE* is combined with the most valuable Alteratives known, such as Iodides, Bromides and Chlorides, and will fully meet the requirements of the practitioners in Syphilis, Scrofula, and all depraved conditions of the blood.

MALTINE WINE.

This preparation contains all the medicinal and nutritive constituents of *MALTINE*, less 60 per cent. of the transformed starch or glucose, which renders the preparation lighter and more acceptable to some stomachs, and is recommended only in such cases.

MALTINE WINE WITH PEPSIN AND PANCREATINE:

(Each fluid ounce of MALTINE WINE contains 15 grains pure PEPSIN and 15 grains pure PANCREATINE).

We can recommend this preparation to the Medical Profession as being the most important remedy ever brought to their notice in all cases of Dyspepsia and Imperfect Nutrition, when the system needs invigorating and replenishing. It will be found, we believe, a perfect remedy in Vomiting in Pregnancy, Cholera Infantum and wasting diseases of children, and in Constipation and Chronic Diarrhœa resulting from mal-nutrition. It will agree with the most irritable stomach.

MALTO-YERBINE.

(Each pint of the above preparation contains 13 ounces MALTINE, 2 ounces CARRAGEEN and 1 ounce YERBINE).

With the nutritive, emollient and demulcent properties of *MALTINE* and *CARRAGEEN*, and the expectorant qualities of *YERBINE* (active principle of Yerba Santa), we offer this preparation to the Profession with the fullest confidence that it is the most perfect remedy yet produced in Chronic Pulmonary Affections, Irritation of the Mucous Membrane, Difficult Expectoration, Bronchitis and ordinary Coughs and Colds.

The Dose of all Preparations of *MALTINE* and compounds is from a dessert to a tablespoonful.

We also manufacture a perfectly prepared EXTRACT OF MALT, from *Barley only.*

MALTINE preparations are sold at the same prices as EXTRACT OF MALT and its combinations, and are put up in half-pint, pint and five-pint amber bottles; each bottle inclosed in a folding paper box.

DIFFERENTIAL DIAGNOSIS;

A MANUAL OF THE

COMPARATIVE SEMEIOLOGY

OF THE MORE IMPORTANT DISEASES,

BY F. DE HAVILLAND HALL, M.D.,

Assistant Physician to the Westminster Hospital, London.

American Edition, with Extensive Additions.

One Volume, 8vo., pp. 205. Printed on handsome tinted paper; bound in English pebbled cloth, with beveled boards. Price $2.00.

SENT BY MAIL, POST-PAID, ON RECEIPT OF THE PRICE.

DR HALL'S work has received the highest encomiums from the English medical press, for its lucid arrangement, completeness, and accuracy. He himself is known in London as a practitioner of great skill, and an unusually successful medical teacher. His work has been considerably enlarged in this edition, the editor having devoted especial attention to (1) pointing out the *early* and often overlooked symptoms of disease (2), enumerating the *pathognomonic* symptoms, and (3) bringing into relief the *peculiar features* of diseases in this country.

Most of the diseases which may be confounded are presented in comparative tables, setting forth their distinctive characteristics in the clearest possible light, and thus greatly facilitating their prompt diagnosis.

THE CONTENTS follow, in a general way, the nomenclature of the College of Physicians; thus the work is divided into two parts, the one on General Diseases, the other on Local Diseases.

The First Part contains, among other matters—

The Symptoms of the Febrile State Defined. Comparative Table of the Temperature and Pulse in the Leading Febrile Diseases. Differences between Symptomatic and Essential Fever. Tabular Comparison of Rötheln, Scarlet Fever, Measles, and Smallpox. Comparison of the Symptoms of Typhoid and Typhus; of Typhoid and Malarial Fever; of Typhoid and Typho-Malarial; of Typhoid Fever and the Typhoid State; of Typhoid and Relapsing Fever. Diagnosis between Epidemic and Sporadic Cerebro-spinal Meningitis; between Epidemic Meningitis and Typhus; between the Same and Congestive Malarial Fever. The Signs of the Arthritic, the Scrofulous, the Syphilitic, and the Tubercular Dyscrasiæ. Gout, Rheumatism, and their Allies.

The Second Part includes the Diagnosis of Local Diseases; embracing, for example—

The Differential Points between Hemorrhage, Thrombosis, and Embolism in the Brain; between the various forms of Sclerosis, Syphilosis, Paralysis, and Ataxy of the Spinal Cord; and between Organic, Functional, Toxic, and Hysterical Paralyses. These extremely difficult problems in diagnosis are set forth with the utmost clearness.

Neuralgia and its Counterfeits (myalgia, spinal irritation, cerebral abscess, alcoholism, hysteria, etc.)

Diagnostic Table of Acute, Chronic, Syphilitic, and Tubercular Laryngitis, Perichondritis, Benign and Malignant Growths, and Neuroses of the Larynx. Distinctions between Inflammatory Croup and Spasmodic Croup, on the one hand, and Membranous Croup and Diphtheria, on the other. Catarrhal as Distinct from Parenchymatous Tonsillitis.

Normal and Abnormal Chest Sounds (in all, eleven very carefully prepared tables). Dr. John Hughes Bennett's General Rules for Diagnosing Heart and Lung Affections. Comparison of the Three Forms of Phthisis. The Diagnosis of Incipient Phthisis (sixteen different signs are given of its very earliest stage). Differential Diagnoses between Incipient Phthisis and Bronchitis; between Acute Phthisis and Typhoid Fever; between Capillary Bronchitis and Pneumonia; between Pneumonia and Pleurisy; Pneumothorax and Pneumo-Hydrothorax, etc.

Dr. Dobell's Aphorisms on the Significance of Pain at and near the Heart; his Aphorisms on the Significance of Clubbing of the Finger Ends. Diagnosis between the Various Cardiac, Aortic, and Mitral Diseases. The Cheyne-Stokes Respiration Discussed.

To Distinguish Acidity of the Stomach from Fermentation and from Hypersecretion; Stomachal Vertigo from Cerebral Vertigo; Gastric Vomiting from Cerebral Vomiting. Comparative Symptoms of Atonic Dyspepsia, Chronic Gastritis, Gastric Ulcer, and Gastric Cancer. Special Points in the Diagnosis of Gastric Cancer. Abdominal Phthisis as Distinguished from Typhoid Fever. The Diagnosis of Hepatic Diseases. Hardy's Handy Tests for Bile in the Urine. What Pain in the Liver may Signify. What Jaundice may Signify. Hepatic Diseases Classified with Regard to the Size of the Liver. The Seven Forms of Bright's Disease Compared. The Four Forms of Diabetes Compared. The Kinds of Calculi and their Tests, etc.

The *British Medical Journal*, says:—"This is not of the type of books brought out by 'grinders.' The tables it contains are invaluable aids by the bedside, enabling the student and practitioner readily to compare signs met with in disease."

The *North Carolina Medical Journal*, says:—"The tabular method of comparing symptoms is well utilized. Very many valuable diagnostic formulæ are brought together."

The *Atlanta Medical Journal*, says:—"The comparative symptoms are given in a very satisfactory manner. The work will afford valuable aid to practitioners."

NEW BOOKS.

JUST PUBLISHED.

Napheys. *Medical Therapeutics.* Sixth edition (1879), 607 pp. Price, cloth, $4.00, leather, $5.00.

This sixth edition has been thoroughly revised, as may be judged from the fact that the Index of Authors contains 188 names not in former editions. A number of new articles have been added, and even those having former issues of the work will find this edition a valuable investment.

Hall, F. De Havilland. *Differential Diagnosis.* A Manual of the Comparative Semeiology of the more important Diseases. 1 vol., square 8vo., pp. 205, cloth. Price $2.00

The author, Dr. Hall, is an eminent London physician and clinical teacher. The *British Medical Journal* says of his book: "It does not partake of the objectionable type of books brought out by 'grinders;' it is an invaluable aid by the bedside, enabling the practitioner and student readily to compare signs met with in disease with those observed in health." An eminent Indiana physician writes: "The Diagnosis is received; I am *immensely* pleased with it."

Sayre, L. E. *Organic Materia Medica and Pharmacal Botany.* 8vo., pp. 220. Price $2.00.

This is a conspectus of the vegetable and animal drugs, including all the officinal and all the new non-officinal preparations. Brief, clear and cheap, it is just the book to post one's self on medical botany and "new remedies." There are charts of botanic materia medica; geographical grouping of plants; table of alkaloids with source, and doses (very complete, and not to be found in any other work); table of antidotes and incompatibles, etc.

Anderson, W. A. *Self-Copying Prescription Record.* Price 50 cts. Three for $1.00.

These records are books of prescription blanks, with carbon paper, case, etc., so arranged that a copy of a prescription is made when it is written; the original is sent to the druggist, the copy retained; and thus, without the slightest trouble, the physician has a record of all his professional work. Wherever used, they have been much liked.

Landolt, E. *A Manual of Examination of the Eyes.* Translated by Dr. Swan M. Burnett. 1 vol., cloth, pp. 250. Price $2.50.

Dr. Landolt is director in the Ophthalmological Laboratory at the Sorbonne, Paris, and his treatise on the Diagnosis of the diseases of the eye has been most favorably received in Europe. The translator, Dr. Burnett, is well known as an ophthalmologist in this country.

☞Any of the above works will be sent, postpaid, by the publisher, on receipt of the price; or they can be ordered through booksellers.

D. G. BRINTON,

115 S. 7th St., PHILADELPHIA.

FOR SALE.—I DESIRE TO SELL MY practice, amounting to from $3500 to $4000. Also House and Lot, Horses, Buggy, and Household Furniture. Goodwill of practice will be sold separate. To a young graduate this is a rare chance, and will be sold cheap, as the subscriber wants to move East. Apply to J. W. Jamison, M.D., Mondamin, Harrison Co., Iowa.
1145-

NOTICE.—A PHYSICIAN HAVING AN average practice of $4000, will sell half to a partner of ability and experience. For further particulars, address "Medical and Surgical Reporter," 115 South 7th Street, Philadelphia, Pa. 1146-1149

WALNUT HILL,

HARTFORD, CONN.

CHARTERED IN 1874.

An Asylum Home for the treatment of *Inebriates* and *Opium Cases.*

Admirably situated, with ample legal powers of control; based on the fact, confirmed by science and experience, that *Inebriety* is both a physical and mental disease, curable as other diseases are, requiring special treatment in asylums, and in all cases relieved and benefited.

A limited number of patients received, and special facilities provided for each case. The objects sought are rest and building up the diseased organism. Among the means employed are, Turkish baths, electricity, tonics, lectures, amusements, and mental diversion, with exact military and hygienic surroundings. For further information address

T. D. CROTHERS, M. D., Superintendent,
1142-1167. Walnut Hill, Hartford, Conn.

TO PHYSICIANS.

—:o:—

In order to facilitate the introduction of the metric system, as well as to furnish a convenient posological table, we have published a Visiting List Dose Book, in which the doses are given both in the metric and in the apothecaries' weights and measures. It is light, and neatly bound in flexible silk covers, so that it may be carried in the visiting list or pocket, without inconvenience. This little book renders the use of the metric system easy and attractive, even to old practitioners. All physicians interested in the advancement of our science are urged to aid us in placing this little book in the hands of the profession, not only by sending for it themselves, but by ordering it for their friends. Sent free on receipt of six cents in postage.

Address, THE METRIC CLUB, 188 Clark Street, Chicago. 1141-1149x

DEXTRO-QUININE.

Equal to Sulphate of Quinine in the same dose—causes in large doses no cerebral distress nor irritability of the stomach—less than one-half as costly as Sulphate of Quinine.

From recent letters recording CLINICAL EVIDENCE OF THE VALUE OF DEXTRO-QUININE, we extract the following:

Mrs. S., æt. 22, married, no children, brunette, suffering from intermittent fever, first paroxysm Nov. 20th, 6 A.M., again at 4 P.M. Prescribed Cinchonidia sulphate, grs. XXX, chart No. V. One to be taken every two hours.

Nov. 21st. Return of paroxysm at 6 A.M. and 4 P.M. Gave Cinchonidia sulphate, grs. XLV, chart No. V. One to be taken every two hours.

Nov. 23d. Return of paroxysm at same time as on preceding days. Prescribed Dextro-Quinine, grs. XX, chart No. V. One to be taken every two hours. No return of chill since that date, and highly pleased with my experience.

N. H. MANRING, M. D.,
Rigdon, Ind.

Dec. 13th. I have used Dextro-Quinine in two cases of malarial fever complicated with so much irritability of the stomach that Quinine or Cinchonidia could not be given. The Dextro-Quinine was well tolerated by the stomach, and acted precisely like Quinine when given in the same doses.

WM. COMMONS, M. D.,
Union City, Ind.

K&M
One Ounce
DEXTRO-QUININE
"K&M."
COMPOSITION C_{20}. H_{46}. N_4. O_3.
DEXTRO-GYRATE WITH POLARIZED LIGHT.
This article is prepared from commercial purified Chinoidine and consists of the 'Amorphous Quinine' of Liebig or the 'Diconchinia' of Hesse. It is equal to Sulphate of Quinine in the same dose, while in price it is less than one half as costly.
MANUFACTURED BY
KEASBEY & MATTISON.
CHEMISTS.
PHILADELPHIA, U. S. A.

Price, $1.50 Per Ounce.

Dec. 13th. I am using in the cases of typhoid fever under my charge, your Dextro-Quinine as a substitute for Sulphate of Quinine, in the same doses, and meet with the same effect. I think it an article of *genuine merit.*

D. E. WELLS, M. D.,
Bethlehem, N. H.

Nov. 29th. After using Dextro-Quinine in cases of ague, I deem it equally good, if not preferable to the Quinine Sulphate. Please give me the names of Druggists in St. Louis or Chicago, of whom I can get it.

C. J. RAGLAND, M. D.,
Mulberry Grove, Ill.

Dec. 14th. I have given Dextro-Quinine in two cases of Tertian ague, with the result of promptly arresting the chills. It caused no unpleasant "head symptoms" in either case. The doses were the same as ordinary doses of Quinine. H. A. RODEBAUGH, M. D., Reynoldsburg, O.

Dec. 12th. I find your Dextro-Quinine well tolerated by the stomach, and produces no distress. I think it has the advantage of Sulphate of Quinine in not producing headache and other disagreeable symptoms. L. NEWCOMB, M. D., N. Scituate, Mass.

Dec. 12th. I think the success attending my administration of your Dextro-Quinine in cases of remittent fever justifies me in saying better results could not be obtained with Sulphate of Quinine itself. It has the advantage of Quinine in not affecting the head and being less disagreeable to the palate. JOS. MULLANE, M. D., Lyons, Ind.

*** Practitioners unable to obtain Dextro-Quinine from their Druggists, can be supplied by us, through the mail, upon receipt of price.

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION, CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines, without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris; notably Drs. BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success.

Prepared by **E. GRILLON,** Pharmacien de lère classe, 27 Rue Rambuteau, Paris. To be had of all respectable Chemists throughout the world.

PEPTODYN.

The New Digestive is a combination of the whole of the Digestive Secretions—Pepsine, Pancreatine, Diastase, etc.,

Forming an invaluable remedy in the treatment of all forms of Dyspepsia, and diseases arising from imperfect nutrition.

N. B.—*The success of this Remedy has led to several imitations of it,* which consist largely of Milk Sugar, and, as compared with Peptodyn, are of little or no real value as digestive agents.

SAVORY & MOORE, 143 New Bond Street, London.

PARIS, 1867.

Prize Medal.

1868.

Silver Medal.

1872.

Gold Medal.

1873, VIENNA.

Medal of Merit.

BOUDAULT'S PEPSINE

IN POWDER, also WINE, ELIXIR, SYRUP, PILLS, AND LOZENGES OF PEPSINE.

Since the introduction of Pepsine by Boudault in 1854, **BOUDAULT'S PEPSINE HAS BEEN, AND IS STILL CONSIDERED, THE MOST RELIABLE,** as is attested by the awards it has received at the Exhibitions of 1867, 1868, 1872, 1873, and in 1876 at the Centennial Exposition in Philadelphia.

IT IS THE ONLY PEPSINE USED IN THE PARIS HOSPITALS.

Careful tests will enable any one to satisfy himself that **BOUDAULT'S PEPSINE HAS A DIGESTIVE POWER AT LEAST DOUBLE** that of the best Pepsines in the market, and that it is really the cheapest.

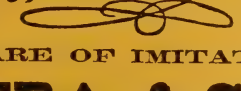
It is Sold in 1 ounce, 8 ounce, and 16 ounce Bottles.

Beware of so-called French Pepsines bearing fictitious names, and prescribe Boudault's only.

BLANCARD'S PILLS

OF UNCHANGEABLE IODIDE OF IRON.

Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired a so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of



Pharmacien, No. 40 Rue Bonaparte, Paris.
without which none are genuine.

BEWARE OF IMITATIONS.

E. FOUCERA & CO., Agents,

NEW YORK.

PHOSPHOROLE.

PHOSPHORUS and COD-LIVER OIL

have now an established position throughout the civilized world as important therapeutical agents. A *perfect combination* of the two has long been a desideratum, since they are both of value in the same disorders, while the cases in which one is demanded and the other contra-indicated are exceedingly rare.

The combination in PHOSPHOROLE has the twofold advantage of furnishing *the best possible form* for the administration of *phosphorus*, and *a more effective form* for the administration of *cod-liver oil*.

With regard to the former, it has been decided by the highest chemical and medical authorities that *phosphorus* should be administered *in a free state*, and in a vehicle which ensures its *perfect diffusion*, its *absolute unalterability*, and, as far as possible, its *prompt assimilation* without the gastric irritation to which the ordinary methods of exhibiting the agent give rise. It is well known that pills, emulsions, solutions in ether, chloroform, vegetable oils and resin, etc., have all failed to fulfill one or more of these conditions. Even an ordinary solution of phosphorus in cod-liver oil would not answer the purpose in all respects. We claim, however, that PHOSPHOROLE completely satisfies all the conditions. From the method of preparing it, in an atmosphere of dry carbonic acid, the phosphorus is *entirely dissolved without oxidation*, and by our mode of manipulation *a positive uniformity of strength* is ensured. It is then promptly bottled and sealed, and its *stability and permanence* thus secured. The exact amount of phosphorus in each dose is known, its efficiency is ensured, and the irritant effects upon the stomach are reduced to a minimum by the blandness of the oil. As a means then of administering *phosphorus* in the many cases in which it is indicated as a *nervous tonic and stimulant*, it is claimed that PHOSPHOROLE is the best attainable in the present state of our knowledge.

The value of *cod-liver oil* in phthisis is so familiar to the physician that it is needless to dwell upon it. But the value of *phosphorus* is also universally recognized in this disease, especially when complicated with nervous derangements. The *combination* of the two therefore furnishes a more effective form for the administration of cod-liver oil in the great majority of cases in which that remedy is indicated, and one which will at once commend itself to the profession.

A dose of two teaspoonfuls of PHOSPHOROLE contains $\frac{1}{100}$ of a grain of phosphorus. This dose, when given after a meal, is effective, and not very liable to interfere with digestion. *Phosphorus is cumulative in its action, and should be administered with watchful care.* About $\frac{1}{12}$ grain is considered the largest safe dose, and we rarely need go higher than $\frac{1}{20}$ or $\frac{1}{30}$ of a grain. At the very first appearance of the smallest gastric derangement, the exhibition of phosphorus should be stopped.

PHOSPHOROLE is handsomely put up in pint bottles only, and may be obtained at all first-class druggists throughout the United States.

APOLLINARIS

NATURAL MINERAL WATER.

HIGHLY EFFERVESCENT.

Approved by the Academy of Medicine of France, and its sale in France authorized by special decree of the French Government.

"THE QUEEN OF TABLE WATERS."—*London Medical Record.*

PROFESSOR OSCAR LIEBREICH, Professor of Medical Chemistry, University of Berlin:—"After minute personal investigation, I can affirm that the Apollinaris Water is bottled according to all the rules of science, and is an entirely Natural Mineral Water."

PROFESSOR J. A. WANKLYN, Lecturer on Chemistry, St. George's Hospital, London:—"I have thoroughly examined the Apollinaris Spring and the method of bottling. The Apollinaris Water, as supplied to the public, is simply and purely a Natural Mineral water, impregnated only with its own gas."

PROFESSOR MOHR, Medical Councilor, University of Bonn:—"After exhaustive investigation, I declare the Apollinaris Water, as supplied to the public, to be purely natural in every respect, and of most excellent quality."

DR. THEODOR KYLL, Analytical Chemist, Town Councilor, Cologne (*expert appointed by United States Vice-Consul, October*, 1877), reported that "The Apollinaris Water, as bottled, deserves in every respect the name of an excellent natural acidulated water."

Every Genuine Bottle bears the REGISTERED YELLOW PICTORIAL LABEL of the Apollinaris Company, Limited, London.

To be had of all Wine Merchants, Grocers, Druggists, and Mineral Water Dealers throughout the United States, and Wholesale of

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION,

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil, by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM, instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat, in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion may therefore be regarded as Chyle obtained by nature's own process. In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more stable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatized Cod-Liver Oil, the active digestive principle of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Pancreatine effects the digestion and assimilation of Cod-Liver Oil and Fat, as well as Food generally. This palatable and popular remedy is therefore invaluable to PATIENTS WHO ARE UNABLE TO DIGEST COD-LIVER OIL, and who are thus deprived of its nourishing and invigorating properties.

Pancreatine Wine. An excellent vehicle for taking Cod-Liver Oil and promoting the digestion of it.

Tins, 1*s*, 2*s*, 5*s*, 10*s*.

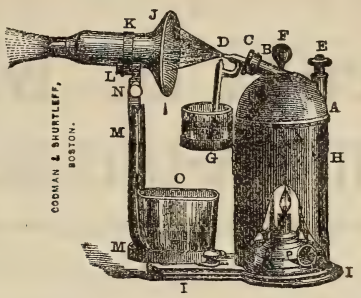
CODMAN & SHURTLEFF'S

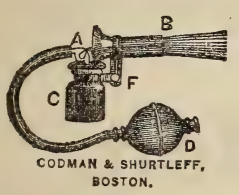
ATOMIZING APPARATUS.

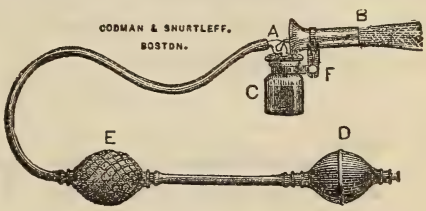
PRICES REDUCED.



THE COMPLETE STEAM ATOMIZER. (Patented March 24, 1868.)

All its joints are hard-soldered.
Every one is tested by hydrostatic pressure, to more than one hundred pounds to the square inch.
It cannot be injured by exhaustion of water, or any attainable pressure, and will last for many years.
It does not throw spirts of hot water, is convenient, durable, portable, compact, and cheap, in the best sense of the word. Price $5.00. Postage 59c.
Brass parts, nickel-plated, additional, $2.00.
Neatly made, strong Black Walnut Box, with convenient Handle, additional, $2.50. Postage 44c.





THE BOSTON ATOMIZER. (Patented.) *SHURTLEFF'S ATOMIZING APPARATUS. (Patented.)*

The most desirable Hand Apparatus. Rubber warranted of the very best quality. Valves imperishable, every one carefully fitted, and will work perfectly in all positions. Price $3.50.
The Bulbs are adapted to all the Atomizing Tubes made by us.
Each of the above Apparatus is supplied with two carefully-made annealed glass Atomizing Tubes, and accompanied with directions for use. Each Apparatus is carefully packed for transportation, and warranted perfect.

13 and 15 TREMONT STREET, BOSTON.

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt. and all its combinations.

Extract of Malt,

WITH COD-LIVER OIL,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO,

(See Transactions of American Medical Association, for 1876, page 176.)

Is presented to the medical profession as an efficient, palatable and very stable combination, consisting of equal parts of the ***Extract of Canadian Barley Malt*** and the best quality of genuine ***Norwegian Cod-liver Oil.*** Many patients take this preparation who cannot take the oil in any other form. It may be employed in all cases where Cod-liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

Extract of Malt,

WITH COD-LIVER OIL AND PHOSPHORUS,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod-liver Oil, Phosphorus being added in the proportion of $\frac{1}{100}$ grain to the dose, and so combined as to be perfectly protected from oxidation. The ***Trommer Extract of Malt Company*** prepare this combination agreeably to the suggestion of ***Dr. Wilson Fox.*** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

Extract of Malt,

WITH COD-LIVER OIL AND IODIDE OF IRON

added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod-liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians, referring to it in terms of high praise.

TO THE MEDICAL PROFESSION.

LACTOPEPTINE,

The most important remedial agent ever presented to the Profession for Indigestion, Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all diseases arising from Imperfect Nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase, or Veg. Ptyalin, Lactic and Hydrochloric Acids, in Combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk.....40 ounces.	Veg. Ptyalin or Diastase.....4 drachms.
Pepsin..... 8 ounces.	Lactic Acid.....5 fl. drachms.
Pancreatine..... 6 ounces.	Hydrochloric Acid.....5 fl. drachms.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its almost universal adoption by the Profession is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned having tested LACTOPEPTINE, recommend it to the Profession:—

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine, University of the City of New York.

LEWIS A. SAYRE, M.D.,
Professor of Orthopædic Surgery and Clinical Surgery, Bellevue Hospital Medical College.

F. LE ROY SATTERLEE, M.D., PH.D.,
Professor of Chem., Mat. Med. and Therap. in the N. Y. College of Dent.: Prof. of Chem. and Hygiene in the Am. Vet. College, etc., etc.

SAMUEL R. PERCY, M.D.,
Professor Materia Medica, New York Medical College.

A. VAN DEVEER, M.D.,
ALBANY, N. Y., June 8th, 1878.
Prof. of the Prin. and Prac. of Surg., Albany Med. Col.; Surg. Albany and St. Peter's Hospitals.
"I have given LACTOPEPTINE a good thorough trial, and have been greatly pleased with the excellent results that have followed its administration."

JOHN H. PACKARD, M.D.,
PHILADELPHIA, PA., May 30th, 1878.
Pres't Phila. Co. Obstet. Society; Surg. Episcopal and Women's Hospitals.
"I have found great satisfaction in the use of LACTOPEPTINE, and have ordered it frequently in cases of Dyspepsia, especially where there is want of tone and defective secretion."

JAS. AITKEN MEIGS, M.D.,
PHILADELPHIA, June 20th, 1878.
Prof. of the Institutes of Med. and Med. Juris., Jeff. Medical College; Phy. to Penn. Hos.
"I have used LACTOPEPTINE with very good effect in a number of cases of Dyspepsia."

W. W. DAWSON, M.D.,
CINCINNATI, O., June 21st, 1878.
Prof. Prin. and Prac. Surg., Med. Col. of Ohio; Surg. to Good Samaritan Hospital.
"I have used LACTOPEPTINE with great advantage in cases of feeble digestion."

ALBERT F. A. KING, M.D.,
WASHINGTON, D. C., June 19th, 1878.
Prof. of Obstetrics, University of Vermont.
"I have used LACTOPEPTINE both in hospital and private practice, and have found it to answer fully the purposes for which it is recommended. As an immediate aid to the digestive function, I know of no remedy which acts more directly."

D. W. YANDELL, M.D.,
LOUISVILLE, KY., March 7th, 1878.
Prof. of the Science and Art of Surg. and Clinical Surg., University of Louisville.
"I have made much use of LACTOPEPTINE, and take great pleasure in stating that it has rarely disappointed me. I shall, of course, continue to prescribe it."

ROBT. BATTEY, M.D.,
ROME, GA., June 8th, 1878.
Emeritus Prof. of Obstetrics, Atlanta Med. College, and Ex-Pres. Med. Association of Ga.
"I have used LACTOPEPTINE in a case of Dyspepsia with satisfaction. I think well of it."

CLAUDE H. MASTIN, M.D., LL.D.,
MOBILE, ALA., June 8th, 1878.
"I consider LACTOPEPTINE the very best preparation of the kind which I have ever employed, and for patients with feeble digestion I know of nothing that is equal to it."

Prof. H. C. BARTLETT, PH.D., F.C.S.,
LONDON, ENG., February 22d, 1876.
"I find the preparation of LACTOPEPTINE contains within itself all the principles required to promote a healthy digestion.

PRICE LIST.

LACTOPEPTINE (in oz. bottles).....per oz.	$1.00
" (" ").....per doz.	10.00
" (in ½ lb ").....per lb.	12.00

SPECIAL FACTS CONCERNING

BELLADONNA PLASTER

IN RUBBER COMBINATION.

PREPAERD BY

SEABURY & JOHNSON.

In undertaking the manufacture of Medicinal Plasters we had but one object in view—THE IMPROVEMENT OF ALL KINDS OF PLASTERS. Among the various plasters manufactured by us was BELLADONNA PLASTER. This article met with a larger demand than some of the others, acquired a reputation among the best druggists, and received the confidence of the profession. Its large sale interfered with rival manufacturers, and continuous efforts have been made on their part to prejudice physicians against it.

As these attacks have been of late more malicious than usual, we have deemed it advisable, in self-defence, and in order to place our article fairly before the practitioner, to assign reasons why we consider it the most thoroughly reliable preparation ever offered the medical profession. First, it is a combination of the Alcoholic Extract of Belladonna only, with purified rubber, and thus possesses all of the advantages of the rubber base, being pliable, convenient of application, and not subject to the deteriorating influence of age, as is the case when any other base is used. Secondly, it is freed from all irritative properties. Thirdly, it is more adhesive than any other plasters. Fourthly, we believe it to be as perfect, in every respect, as it is possible to make a Belladonna plaster.

ENGLISH EXTRACTS—WHY WE DO NOT EMPLOY THEM.

Imported English Extracts are prepared from the Inspissated Juice of the leaf, while our pharmacopœia formula is treated by Alcohol. The active principle of Belladonna (Atropia) is only partially obtained by Inspissation. The employment of Alcoholic or Hydro-Alcoholic Solvents completely exhausts the entire strength of the drug.

The value of both preparations is clearly presented in an able treatise published in the *American Journal of Pharmacy*, April 1876, page 145. Our own investigations are substantially identical :—

TABLE OF RESULTS,

	Test solution requisite for 100 cc. of Ext. Solution.	Percentage of Atropia in Extract.
EXT. BELLADONNÆ ALCOH. U. S. P.	*17·732*	*2·571*
GEO. ALLEN & CO., English	*9·73*	*1·411*
*HERRINGS & CO., " *	*8·133*	*1·179*
E. MERCK, Germany (aqueous extract), made 1869	*1·9*	*·275*

This analysis clearly establishes the fact that the **Alcoholic Extract of Belladonna of the U. S. P. averages over twice the strength of English Extracts,** and should, therefore, be preferred in all cases where a reliable article is desired. Inspissated and Aqueous Extracts deteriorate, while Alcoholic remain stable.

Therefore the assumption of pretentious manufacturers, that the English Extracts are the superior preparations, must be based on a former supposition rather than present facts. The following analysis substantiates our claim regarding English Extracts.

ANALYSIS OF BELLADONNA PLASTERS, BY PROF. R. OGDEN DOREMUS.

"BELLEVUE HOSPITAL COLLEGE, New York, Sept. 7, 1878.

"GENTLEMEN—I obtained from Messrs. W. H. Schieffelin & Co., of this city, samples of Belladonna Plasters prepared by Grosvenor & Richards, Boston ; Mitchell Novelty Plaster Works ; Seabury & Johnson, New York and London. I have examined these varieties for the purpose of determining which possesses the largest quantity of Atropine. I employed equal surfaces of each, and *my analysis demonstrated that* SEABURY & JOHNSON'S *contains the greatest proportion* of the active principle of Belladonna. "R. OGDEN DOREMUS, M.D., L.L.D."

Belladonna Plaster, prepared by Seabury & Johnson, is packed in elegant tin cases, which contain 1 yard each, and can be obtained of almost any druggist throughout the United States and Canada, or will be furnished direct by mail. Samples sent on application.

What the Medical Profession Say.

MILWAUKEE TESTIMONIALS.

(Milwaukee is 20 miles from the Spring.)

What Surgeon-General Wolcott and other prominent medical men say about the Bethesda Water:—

DR. WOLCOTT—Dear Sir: My attention has lately been called to the Bethesda Mineral Water, of Waukesha, as a remedy for Diabetes, Bright's Disease, etc., and I desire, in behalf of an afflicted friend, to ask of you the favor of submitting briefly your views of its merits, or its claims to the confidence of the profession as a medical agent in the maladies named, and you will much oblige, J. W. RIGGS, M.D.

J. W. RIGGS, M.D.—Dear Sir: Many cases of Diabetes and other forms of Urinary Disorders have been cured or greatly relieved by the use of the water; so much so that the Spring has already a wide-spread reputation. What time may do, either in sustaining or destroying this rapidly acquired reputation, remains to be seen. It is a test too severe for most very rapidly famous remedies, but this may, nevertheless, stand it. Very respectfully,

E. B. WOLCOTT, M.D.

Two years after the above was written, Dr. Wolcott says—

I am gratified to find that the opinion given by me over two years ago, on the medical properties of the Bethesda Water, has been fully sustained and confirmed by its use, in a vast number and great variety of cases involving the urinary organs. In many, nay, in most of such cases, I do not hesitate to say that it is vastly superior to any other remedy known to the profession. E. B. WOLCOTT, M.D.

We fully concur in the above.

O. P. WOLCOTT, M.D.
J. E. GARDNER, for diabetes.
H. XELOWSKI, M.D.
J. M. ALLEN, M.D.

What Dr. Thompson (late Surgeon in charge of National Asylum) says about the Bethesda Water:—

I have known many acute and Chronic diseases of the kidneys and urinary organs permanently relieved by the use of Bethesda Spring Water after resisting ordinary medical treatment. I regard the water as possessing remarkable medicinal properties, and have observed its effects for the past two years.

J. H. THOMPSON, M.D,
Late Surgeon in charge National Asylum, 210 Wisconsin street, Milwaukee.

What Dr. Marks (late President Wisconsin Medical Society) says about Bethesda Water:—

During the past two years I have prescribed Bethesda Water for quite a number of patients who were suffering from diabetes, and unhesitatingly pronounce it *the best* remedy I have used for that disease.

S. MARKS, M.D.

General Agent for this Water, for the States of Pennsylvania, Indiana, Ohio, West Virginia, New Jersey and Maryland—

SEND FOR PAMPHLETS. MAILED FREE.

SCOTT'S EMULSION

PURE COD LIVER OIL

WITH

HYPOPHOSPHITES OF LIME AND SODA

PERFECT, PERMANENT, PALATABLE.

We respectfully ask the Medical Profession to give the above preparation a trial, knowing they will find it just the thing long desired, and obtain splendid results in the wasting diseases indicated by malnutrition and assimilation. The *perfect* and *permanent* union of the Cod Liver Oil with the Hypophosphites, and the thorough manner in which the nauseous taste is disguised, renders it so palatable that the most delicate stomach can retain it. The notable advantage it possesses over all other preparations, is its *permanency* as an *emulsion*, remaining for an almost unlimited time without the slightest separation or change, which enables the Physician always to prescribe it in its proper proportions. The oil is prepared expressly for us, and guaranteed strictly pure. We will gladly furnish, express paid, a 4-oz. sample to any Physician in the country who may not have been supplied.

Formula.—50 per cent. of pure Cod Liver Oil, 6 grs. of the Hypophosphite of Lime, and 3 grs. of the Hypophosphite of Soda to a fluid ounce.

SCOTT & BOWNE,
Manufacturing Chemists, 125 Hudson Street, N. Y.

Messrs. SCOTT & BOWNE: NEW YORK, September 4, 1876.

Gents—I have prescribed Scott's Emulsion of Cod Liver Oil with Hypophosphites in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather, and is more palatable than any other preparation of oil that I have used. Yours, very respectfully,
ROBERT WATTS, M.D., President Medical Board, Charity Hospital.

Messrs. SCOTT & BOWNE:

Gentlemen—Having given your Emulsion of Cod Liver Oil and Hypophosphites of Lime and Soda a fair trial during the past eighteen months, am very much pleased with the same, and consider it the best preparation of the kind in the market.
Yours, truly, J. H. HARTMAN, M.D., Baltimore, Md.

We also refer to the following Physicians, who use it and recommend it to the Profession:

G. C. SHATTUCK, M.D., 18 Stamford Street (Late Visiting Physician, Mass. General Hospital).
J. AYER, M.D., No. 6 Hancock Street, Boston.
G. W. GAY, M.D., 575 Tremont Street (Visiting Surgeon Boston City Hospital).
F. E. BUNDY, M.D., 99 Waltham Street, Boston.
W. B. MACKIE, M.D., 675 Tremont Street, Boston.
J. A. OCTERLONY, M.D., Louisville, Ky.
J. SIMONAUD, M.D., New Orleans.
G. LANE TANEYHILL, M.D., Baltimore.
EDWARD A. MARIS, M.D., Baltimore.

LONDON MF'G CO.'S ESSENCES OF MEATS

FOR INVALIDS, INFANTS AND TRAVELERS.

ESSENCE OF BEEF, MUTTON, CHICKEN.

These Essences are the finest juices from choice meats, entirely free from fatty or injurious matter. They retain the fine flavor and smell of the meats. Are heavy liquids in a warm temperature and when placed upon Ice take a jelly form especially grateful to invalids. Children will readily take them, and in many of their complaints Essences are unequaled. Being used **WITHOUT WATER,** *they do not cause nausea as does Beef Tea, and they will remain upon the stomach when all other nourishment is rejected. In mental or physical prostration they act as strong stimulants, without the subsequent injurious effects produced by alcohol. In Dyspepsia and all Chronic Diseases of the Stomach, they are easily assimilated and are helpful in Consumption and other wasting diseases. Natural, pleasant and refreshing in fevers. Afford concentrated meat stimulant after child-birth. Are convenient for persons boarding or traveling.*

Taken cold direct from the can, needing no preparation whatever.

Sold by Druggists and Fine Grocers.

L. REICH,

DIRECT IMPORTER OF THE

Hungarian

EVER BROUGHT

CHOICEST AND PUREST

WINES

TO THIS COUNTRY,

STRICTLY FOR MEDICINAL USE.

13 West 11th St., New York.

Mr. REICH will be pleased to see those of the Medical Profession who may desire to avail themselves of the opportunity of procuring **STRICTLY FIRST-CLASS WINES**, which have received the endorsement of the most eminent Medical men of the country, as is evidenced from the following letters of commendation which have been received:—

This is to Certify, that I have examined Mr. L. REICH'S TOKAYER AUSBRUCH, TOKAYER MASLAS and BUDAI IMP. I take great pleasure in commending these Wines to the Medical Profession because of their purity.

R. OGDEN DOREMUS, M.D., LL.D.,
Prof. of Chem. and Toxicology in Bellevue Hosp. Med. Col., and Prof. of Chem. and Physics in Col. City of New York.

We have used in our practice the Hungarian Wines sold by Mr. LORENZ REICH, who puts them on the market unadulterated, just as they are imported. To this fact we attribute their great value as a medicine in diseases where such tonics are indicated, especially in those which are attended by defective digestion and imperfect assimilation. We cordially recommend Mr. REICH and his Wines to our professional brethren.

THE WEEKLY
MEDICAL AND SURGICAL REPORTER.

THE MEDICAL AND SURGICAL REPORTER has been established over thirty years, and has, it is believed, a *bonâ fide* subscription list unsurpassed by any medical weekly in America.

It is issued every Saturday, neatly cut and bound, and gives 24 large octavo, doubled-columned pages of reading matter in each number. It claims the following

SPECIAL FEATURES:

IT IS INDEPENDENT, being controlled by no clique, college, society or publishing house.

COSMOPOLITAN. Having subscribers and contributors in every State in the Union, it is edited in the interest of the *whole profession*, not of one section or locality.

EMINENTLY PRACTICAL. Special prominence is given to Diagnosis and Therapeutics—the *recognition* and the *treatment* of disease, the real *business* of the professional man.

UNSURPASSED IN CHEAPNESS. When the *size* and *number* of its pages, and its frequency of issue are taken into account, it gives more matter for the money than any other medical journal in this country.

PARTICULARLY SUITED TO COUNTRY PHYSICIANS. It has always been a special aim of the editor to furnish a journal that would keep a reader remote from medical centres *fully up to the times* in his profession. Every surgical invention and new remedy of value, every medical book of moment, every professional discussion or news item of interest, will be found recorded in its pages. *Contributions* from country physicians are always welcome.

THE HALF-YEARLY COMPENDIUM

Appears on January 1st and July 1st of each year, forming two semi-annual volumes of 300 large octavo pages each, with complete Index. It has been established ten years, with a constantly growing circulation.

☞ While complete in itself, it is also intended as a **Companion Journal to the Medical and Surgical Reporter**; it is made up from articles *which have not been included* in the latter. The one journal is the Complement of the other.

From 600 to 700 separate articles appear each year in its various departments, carefully prepared, and giving the choicest selections from all sources, American and Foreign. It is the *only* work of the kind which does justice to *American* writers in medicine.

The Physician's Daily Pocket Record,

COMPRISING A VISITING LIST, MANY USEFUL MEMORANDA, TABLES, Etc.

By S. W. BUTLER, M.D.

Edited Annually, and Adapted for 35 or 70 Patients Daily. Strongly Bound in Morocco, with Steel Spring Clasp.

PRICE: { **Edition for 35 Patients Daily, - - $1.50**
" 70 " " - - 2.00

☞ The name of the purchaser will be stamped in gilt letters on the tuck, for 10 cents extra. ☜

D. G. BRINTON, M.D.,

115 SOUTH SEVENTH STREET, PHILADELPHIA.

DIFFERENTIAL DIAGNOSIS;

A MANUAL OF THE

COMPARATIVE SEMEIOLOGY

OF THE MORE IMPORTANT DISEASES,

BY F. DE HAVILLAND HALL, M. D.,

Assistant Physician to the Westminster Hospital, London.

American Edition, with Extensive Additions.

One Volume, 8vo., pp. 205. Printed on handsome tinted paper; bound in English pebbled cloth, with beveled boards. Price $2.00.

SENT BY MAIL, POST-PAID, ON RECEIPT OF THE PRICE.

Dr. Hall's work has received the highest encomiums from the English medical press, for its lucid arrangement, completeness, and accuracy. He himself is known in London as a practitioner of great skill, and an unusually successful medical teacher. His work has been considerably enlarged in this edition, the editor having devoted especial attention to (1) pointing out the *early* and often overlooked symptoms of disease (2), enumerating the *pathognomonic* symptoms, and (3) bringing into relief the *peculiar features* of diseases in this country.

Most of the diseases which may be confounded are presented in comparative tables, setting forth their distinctive characteristics in the clearest possible light, and thus greatly facilitating their prompt diagnosis.

The Contents follow, in a general way, the nomenclature of the College of Physicians; thus the work is divided into two parts, the one on General Diseases, the other on Local Diseases.

The First Part contains, among other matters—

The Symptoms of the Febrile State Defined. Comparative Table of the Temperature and Pulse in the Leading Febrile Diseases. Differences between Symptomatic and Essential Fever. Tabular Comparison of Rötheln, Scarlet Fever, Measles, and Smallpox. Comparison of the Symptoms of Typhoid and Typhus; of Typhoid and Malarial Fever; of Typhoid and Typho-Malarial; of Typhoid Fever and the Typhoid State; of Typhoid and Relapsing Fever. Diagnosis between Epidemic and Sporadic Cerebro-spinal Meningitis; between Epidemic Meningitis and Typhus; between the Same and Congestive Malarial Fever. The Signs of the Arthritic, the Scrofulous, the Syphilitic, and the Tubercular Dyscrasiæ. Gout, Rheumatism, and their Allies.

The Second Part includes the Diagnosis of Local Diseases; embracing, for example—

The Differential Points between Hemorrhage, Thrombosis, and Embolism in the Brain; between the various forms of Sclerosis, Syphilosis, Paralysis, and Ataxy of the Spinal Cord; and between Organic, Functional, Toxic, and Hysterical Paralyses. These extremely difficult problems in diagnosis are set forth with the utmost clearness.

Neuralgia and its Counterfeits (myalgia, spinal irritation, cerebral abscess, alcoholism, hysteria, etc.)

Diagnostic Table of Acute, Chronic, Syphilitic, and Tubercular Laryngitis, Perichondritis, Benign and Malignant Growths, and Neuroses of the Larynx. Distinctions between Inflammatory Croup and Spasmodic Croup, on the one hand, and Membranous Croup and Diphtheria, on the other. Catarrhal as Distinct from Parenchymatous Tonsillitis.

Normal and Abnormal Chest Sounds (in all, eleven very carefully prepared tables). Dr. John Hughes Bennett's General Rules for Diagnosing Heart and Lung Affections. Comparison of the Three Forms of Phthisis. The Diagnosis of Incipient Phthisis (sixteen different signs are given of its very earliest stage). Differential Diagnoses between Incipient Phthisis and Bronchitis; between Acute Phthisis and Typhoid Fever; between Capillary Bronchitis and Pneumonia; between Pneumonia and Pleurisy; Pneumothorax and Pneumo-Hydrothorax, etc.

Dr. Dobell's Aphorisms on the Significance of Pain at and near the Heart; his Aphorisms on the Significance of Clubbing of the Finger Ends. Diagnosis between the Various Cardiac, Aortic, and Mitral Diseases. The Cheyne-Stokes Respiration Discussed.

To Distinguish Acidity of the Stomach from Fermentation and from Hypersecretion; Stomachal Vertigo from Cerebral Vertigo; Gastric Vomiting from Cerebral Vomiting. Comparative Symptoms of Atonic Dyspepsia, Chronic Gastritis, Gastric Ulcer, and Gastric Cancer. Special Points in the Diagnosis of Gastric Cancer. Abdominal Phthisis as Distinguished from Typhoid Fever. The Diagnosis of Hepatic Diseases. Hardy's Handy Tests for Bile in the Urine. What Pain in the Liver may Signify. What Jaundice may Signify. Hepatic Diseases Classified with Regard to the Size of the Liver. The Seven Forms of Bright's Disease Compared. The Four Forms of Diabetes Compared. The Kinds of Calculi and their Tests, etc.

The *British Medical Journal*, says:—"This is not of the type of books brought out by 'grinders.' The tables it contains are invaluable aids by the bedside, enabling the student and practitioner readily to compare signs met with in disease."

The *North Carolina Medical Journal*, says:—"The tabular method of comparing symptoms is well utilized. Very many valuable diagnostic formulæ are brought together."

The *Atlanta Medical Journal*, says:—"The comparative symptoms are given in a very satisfactory manner. The work will afford valuable aid to practitioners."

NEW BOOKS.

JUST PUBLISHED.

Napheys. *Medical Therapeutics.* Sixth edition (1879), 607 pp. Price, cloth, $4.00, leather, $5.00.

This sixth edition has been thoroughly revised, as may be judged from the fact that the Index of Authors contains 188 names not in former editions. A number of new articles have been added, and even those having former issues of the work will find this edition a valuable investment.

Hall, F. De Havilland. *Differential Diagnosis.* A Manual of the Comparative Semeiology of the more important Diseases. 1 vol., square 8vo., pp. 205, cloth. Price $2.00

The author, Dr. Hall, is an eminent London physician and clinical teacher. The *British Medical Journal* says of his book: "It does not partake of the objectionable type of books brought out by 'grinders;' it is an invaluable aid by the bedside, enabling the practitioner and student readily to compare signs met with in disease with those observed in health." An eminent Indiana physician writes: "The Diagnosis is received; I am *immensely* pleased with it."

Sayre, L. E. *Organic Materia Medica and Pharmacal Botany.* 8vo., pp. 220. Price $2.00.

This is a conspectus of the vegetable and animal drugs, including all the officinal and all the new non-officinal preparations. Brief, clear and cheap, it is just the book to post one's self on medical botany and "new remedies." There are charts of botanic materia medica; geographical grouping of plants; table of alkaloids with source, and doses (very complete, and not to be found in any other work); table of antidotes and incompatibles, etc.

Anderson, W. A. *Self-Copying Prescription Record.* Price 50 cts. Three for $1.00.

These records are books of prescription blanks, with carbon paper, case, etc., so arranged that a copy of a prescription is made when it is written; the original is sent to the druggist, the copy retained; and thus, without the slightest trouble, the physician has a record of all his professional work. Wherever used, they have been much liked.

Landolt, E. *A Manual of Examination of the Eyes.* Translated by Dr. Swan M. Burnett. 1 vol., cloth, pp. 250. Price $2.50.

Dr. Landolt is director in the Ophthalmological Laboratory at the Sorbonne, Paris, and his treatise on the Diagnosis of the diseases of the eye has been most favorably received in Europe. The translator, Dr. Burnett, is well known as an ophthalmologist in this country.

☞ Any of the above works will be sent, postpaid, by the publisher, on receipt of the price; or they can be ordered through booksellers.

TO PHYSICIANS.

—:o:—

In order to facilitate the introduction of the metric system, as well as to furnish a convenient posological table, we have published a Visiting List Dose Book, in which the doses are given both in the metric and in the apothecaries' weights and measures. It is light, and neatly bound in flexible silk covers, so that it may be carried in the visiting list or pocket, without inconvenience. This little book renders the use of the metric system easy and attractive, even to old practitioners. All physicians interested in the advancement of our science are urged to aid us in placing this little book in the hands of the profession, not only by sending for it themselves, but by ordering it for their friends. Sent free on receipt of six cents in postage.

Address, THE METRIC CLUB, 637 West Adams Street, Chicago. 1141-1149x

WALNUT HILL,

HARTFORD, CONN.

CHARTERED IN 1874.

An Asylum Home for the treatment of *Inebriates* and *Opium Cases.*

Admirably situated, with ample legal powers of control; based on the fact, confirmed by science and experience, that *Inebriety* is both a physical and mental disease, curable as other diseases are, requiring special treatment in asylums, and in all cases relieved and benefited.

A limited number of patients received, and special facilities provided for each case. The objects sought are rest and building up the diseased organism. Among the means employed are, Turkish baths, electricity, tonics, lectures, amusements, and mental diversion, with exact military and hygienic surroundings. For further information address

Dextro-Quinine in Intermittent Fever.

Case.	Name and Sex of Patient.	Age, etc.	Number of Paroxysms before taking.	Number of Paroxysms after.	Dose and Mode of Exhibition.	Total amount Exhibited.	Remarks, Pathological and Physiological Phenomena, etc.	Reported by
1	J. S. S.	27	14	0	10 grs. at bedtime.	30 grs.	I have found Dextro-Quinine fully equal to the Sulphate of Quinia, with almost none of the disagreeable symptoms of the latter.	F. C. Hageman, M.D., Seaford, L.I.
2	D. V. W.	14	5	0	8 grs. at bedtime.	24 grs.		
3	Emma L.	16	60 or more.	0	5 grs. every three hours, in glycerine, without intermission, only during febrile exacerbations, etc.	30 grs.	Patient was very much prostrated with typho-malarial fever; been under the care of another physician; was called in on the third week. I then prescribed 5 grs. of Dextro-Quinine every three hours, in glycerine, when, as it were by magic, all the grave symptoms abated at once, and the patient made a rapid recovery.	Alex. F. Joseph, M.D., Napoleon, Ind.
21	Mrs. S., *Double Quotidian.* Had taken large doses. Cinchonidia sulphate without effect.	22 Brunette. Married. No children.	6	0	20 grs. divided into chart. No. v, one every two hours.	20 grs.	Had first paroxysm Nov. 20, 6 A.M., again at 4 P.M. Presented Cinchonidia sulphate, grs. xxx, chart. No. v. One to be taken every two hours. Nov. 21. Return of paroxysm at 6 A.M. and 4 P.M. Gave Cinchonidia sulphate, grs. xlv, chart. No. v. One to be taken every two hours. Nov. 22. Return of paroxysm at same time as on preceding days. Prescribed Dextro-Quinine, grs. xx, chart. No. v. One to be taken every two hours. No return of chill since that date, and highly pleased with my experience.	N. H. Manring, M.D., Rigdon, Ind.
15	I. de L., female. *Tertian.* Habituated to Quinia.	19 Married.	2	0	15 grs. in 3 doses of 5 grs., taken at intervals of ½ hour, commencing four hours before expected paroxysm. Taken in capsule.	15 grs.	Dilatation of pupil; tinnitus aurium severe, but not so much so as on former occasions when Sulphate of Quinia was used. Directed her to take 10 grains on the third day, but she did not do so. Twelve days have elapsed without return of chills. Is taking citrate of iron and strychnia.	
16	Jennie S., colored. *Quotidian.* Has "used Quinine and everything else," as she herself expressed it.	25 Married.	Unknown, but a very large number.	1	16 grs. in 4 doses, in capsule, with 1-16 gr. Morph. acet., to be taken at ½ hour intervals, commencing four hours before expected paroxysm.	48 grs.	On first evening after exhibition of Dextro-Quinine had a very slight ague, followed by considerable fever, which, however, soon passed off. Gave Hydrarg. Chlor. Mite, grs. x, at bedtime, which caused three or four operations of the bowels. The Dextro-Quinine was continued the next day. *Missed chill for first time in over a month.* Thought it best to continue medicine (without Morphia) another day. Has had no return up to to-day (10 days). Did not complain of tinnitus.	Frank S. James, Ph.D., M.D., Osceola, Ark.
5	Mary B.	3½	3	0	1 gr., in solution, every three hours.	16 grs.	Commenced the Dextro-Quinine just after last paroxysm; it acted excellently. It is now more than four weeks since she took the remedy; there has been no return. She is now in the enjoyment of good health.	G. H. Berry, M.D., New York City.
6	Edward Libby. *Tertian.*	24	9 or 10	0	Two 12-grain doses at half-hour intervals.	24 grs.	Had been taking Sulphate of Quinia in 5-gr. doses for some time, with little or no effect. Has had no chill since the Dextro-Quinine was administered (more than a month having elapsed), and the result is entirely satisfactory.	H. A. Weymouth, M.D., Saco, Me.
11	Mary Cavanough. *Quotidian.*	3	One a day for six months.	0	2 grs. in powder, every two to three hours.	15 grs.	Little girl had been complaining with chills and fever for over six months; had used Sulphate of Quinia, Tincture Cinchona, Cincho-Quinine, etc. *Had taken great quantities of Sulphate of Quinia, without effecting a cure. I gave in all about 15 grs. of Dextro-Quinine, and she never has had any chill since.* This one case in particular I think a remarkable one. The little girl had had chills regularly, almost every day, for over six months, had been treated by two physicians, and a cure could not be effected, as they and the family thought, under any circumstances. I was called directly after, and gave 2 grs. *Dextro-Quinine*, in powder, every two to three hours, and to my great surprise, as well as every one else's, she failed to have any more chills. I then put her on a tonic of iron, and she is now enjoying good health. I consider the Dextro-Quinine far superior to any of the preparations of Quinine, and, from what I have seen of its medicinal effects, I do not hesitate to recommend it as superior to all other remedies in Remittent and Intermittent Fevers.	J. H. Struble, M.D., Stanhope, N. J.

DEXTRO-QUININE sent by mail, at the rate of $1.50 per ounce, to Physicians who cannot be supplied by their local Druggists. Address

KEASBEY & MATTISON, Philadelphia.

DOCTOR RABUTEAU'S

(Laureate of the Institute of France.)

DRAGEES, ELIXIR & SYRUP

Of Proto-Chloride of Iron.

"The experiments made in the hospitals of Paris have demonstrated that *Dr. Rabuteau's Dragees, Elixir and Syrup* regenerate the red globules of the blood with a rapidity never observed with the use of the other ferruginous preparations. These results have been proved by the various *Compt-Globules.*

"The ferruginous preparations of *Dr. Rabuteau* do not cause any constipation, and are perfectly tolerated by the weakest persons."—*Gazette des Hospitaux.*

Dr. Rabuteau's Elixir is prescribed when some difficulty is experienced in swallowing the Dragees; it is especially adapted to weak persons, whose digestive functions need strengthening or stimulating.

Dr. Rabuteau's Syrup is especially prepared for children, who take it readily, because of its agreeable taste.

MEYNET'S

DRAGEES OF COD-LIVER EXTRACT.

Careful experiments have established the fact that the **EXTRACT OF COD LIVERS** contains very valuable properties, which render it superior to the ordinary cod-liver oil. It is composed principally of *Gaduine,* large proportions of *Iodides, Chlorides, Bromides, Phosphoric Acid, Lime, Soda* and *Ammonia,* and especially *Propylamin,* all of which enter, but in very small proportions, into cod-liver oil.

These dragees of pure cod-liver extract take the place of cod-liver oil, and have been used with eminent success by medical celebrities of Europe in cases of *Scrofula, Rheumatic Affections, Rachitism, Phthisis,* and in all cases where a propylamic medication is indicated.

MEYNET'S DRAGEES are sold in bottles containing 100 dragees. Dose, 2 to 6 a day. Each dragee is equivalent to two tablespoonfuls of cod-liver oil.

MEYNET'S GRAINS are small granules intended for children. 10 are equivalent to 1 dragee.

E. FOUGERA & CO., New York, Agents for the U. S.

RIGOLLOT'S MUSTARD PAPER.

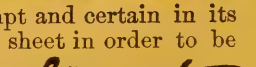
Is one of the most important and useful discoveries of the age, but it is not (as certain dealers of bad faith pretend) a preparation that any one can make, for it is not manufactured with a mustard that every one can buy.

RIGOLLOT'S MUSTARD PAPER.

Is the invention of Mr. P. RIGOLLOT, who is the exclusive owner; it is the only preparation which has been adopted by the civil and military hospitals and the armies and navies of France and England, and which has obtained a medal at the Centennial Exposition at Philadelphia. All other mustard plasters or leaves of whatever name, are but imitations of the original

RIGOLLOT'S MUSTARD PAPER.

Physicians will find it the most reliable sinapism, prompt and certain in its action, and will therefore always prescribe it. Every sheet in order to be genuine must bear the annexed signature of the inventor,



Sold in tin boxes containing 10 sheets, also 25 and 100 sheets, by all respectable chemists throughout the world.

E. FOUCERA & CO., Agents,

NEW YORK.

PHOSPHOROLE.

PHOSPHORUS and COD-LIVER OIL

have now an established position throughout the civilized world as important therapeutical agents. A *perfect combination* of the two has long been a desideratum, since they are both of value in the same disorders, while the cases in which one is demanded and the other contra-indicated are exceedingly rare.

The combination in PHOSPHOROLE has the twofold advantage of furnishing *the best possible form* for the administration of *phosphorus*, and *a more effective form* for the administration of *cod-liver oil*.

With regard to the former, it has been decided by the highest chemical and medical authorities that *phosphorus* should be administered *in a free state*, and in a vehicle which ensures its *perfect diffusion*, its *absolute unalterability*, and, as far as possible, its *prompt assimilation* without the gastric irritation to which the ordinary methods of exhibiting the agent give rise. It is well known that pills, emulsions, solutions in ether, chloroform, vegetable oils and resin, etc., have all failed to fulfill one or more of these conditions. Even an ordinary solution of phosphorus in cod-liver oil would not answer the purpose in all respects. We claim, however, that PHOSPHOROLE completely satisfies all the conditions. From the method of preparing it, in an atmosphere of dry carbonic acid, the phosphorus is *entirely dissolved without oxidation*, and by our mode of manipulation *a positive uniformity of strength* is ensured. It is then promptly bottled and sealed, and its *stability and permanence* thus secured. The exact amount of phosphorus in each dose is known, its efficiency is ensured, and the irritant effects upon the stomach are reduced to a minimum by the blandness of the oil. As a means then of administering *phosphorus* in the many cases in which it is indicated as a *nervous tonic and stimulant*, it is claimed that PHOSPHOROLE is the best attainable in the present state of our knowledge.

The value of *cod-liver oil* in phthisis is so familiar to the physician that it is needless to dwell upon it. But the value of *phosphorus* is also universally recognized in this disease, especially when complicated with nervous derangements. The *combination* of the two therefore furnishes a more effective form for the administration of cod-liver oil in the great majority of cases in which that remedy is indicated, and one which will at once commend itself to the profession.

A dose of two teaspoonfuls of PHOSPHOROLE contains $\frac{1}{100}$ of a grain of phosphorus. This dose, when given after a meal, is effective, and not very liable to interfere with digestion. *Phosphorus is cumulative in its action, and should be administered with watchful care.* About $\frac{1}{12}$ grain is considered the largest safe dose, and we rarely need go higher than $\frac{1}{20}$ or $\frac{1}{30}$ of a grain. At the very first appearance of the smallest gastric derangement, the exhibition of phosphorus should be stopped.

PHOSPHOROLE is handsomely put up in pint bottles only, and may be obtained at all first-class druggists throughout the United States.

Descriptive Circulars furnished upon application.

FOOD IS THE BEST TONIC!!

MENSMAN'S

PEPTONIZED

BEEF TONIC.

The great necessity for a fluid food that would possess *all the elements necessary for the support of the system,* having been long felt by the medical profession, we call attention to this preparation, containing the entire nutritious properties of the muscular fibre, blood, bone, and brain of a healthy bullock, dissolved and semi-digested by aid of heat and pepsin, and preserved by spirit; thus constituting a most perfect nutritive, reconstructive tonic.

It is not a mere stimulant, like the now fashionable extracts of beef, but contains blood-making, force-generating, and life-sustaining properties, pre-eminently calculated to support the system under the exhausting and wasting process of fevers and other acute diseases, and to rebuild and recruit the tissues and forces, whether lost in the destructive march of such affections, or induced by overwork, general debility, or the more tedious forms of chronic disease.

It is friendly and helpful to the most delicate stomach, and where there is a fair remnant to build on, will reconstruct the most shattered and enfeebled constitution. It is entirely free from any drugs.

It is prepared after a thoroughly tested and scientific method.

APOLLINARIS

NATURAL MINERAL WATER.

HIGHLY EFFERVESCENT.

Approved by the Academy of Medicine of France, and its sale in France authorized by special decree of the French Government.

"THE QUEEN OF TABLE WATERS."—*London Medical Record.*

PROFESSOR OSCAR LIEBREICH, Professor of Medical Chemistry, University of Berlin:—"After minute personal investigation, I can affirm that the Apollinaris Water is bottled according to all the rules of science, and is an entirely Natural Mineral Water."

PROFESSOR J. A. WANKLYN, Lecturer on Chemistry, St. George's Hospital, London:—"I have thoroughly examined the Apollinaris Spring and the method of bottling. The Apollinaris Water, as supplied to the public, is simply and purely a Natural Mineral water, impregnated only with its own gas."

PROFESSOR MOHR, Medical Councilor, University of Bonn:—"After exhaustive investigation, I declare the Apollinaris Water, as supplied to the public, to be purely natural in every respect, and of most excellent quality."

DR. THEODOR KYLL, Analytical Chemist, Town Councilor, Cologne (*expert appointed by United States Vice-Consul, October,* 1877), reported that "The Apollinaris Water, as bottled, deserves in every respect the name of an excellent natural acidulated water."

Every Genuine Bottle bears the REGISTERED YELLOW PICTORIAL LABEL of the Apollinaris Company, Limited, London.

To be had of all Wine Merchants, Grocers, Druggists, and Mineral Water Dealers throughout the United States, and Wholesale of

DUREL'S
TAR AND IRON SYRUP AND CAPSULES.

PREPARED BY DUREL, PHARMACIST, PARIS.

The combination in one preparation of the stimulating and balsamic properties of Tar with the tonic properties of a salt of iron is a desideratum which has at last been attained in these preparations. The indications for such a remedy are many, but it has been found especially useful in CHLOROSIS, BRONCHIAL CATARRH, CATARRH OF THE BLADDER, CHRONIC UTERINE DISCHARGES, depending upon an enfeebled or relaxed state of the system.

Sold by Chemists generally.

CRINON'S HÆMOGLOBIN,

The Albuminoid Ferruginous Principle of Blood.

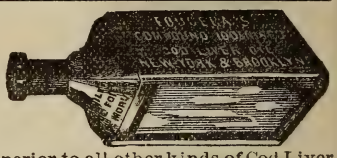
HÆMOGLOBIN is the only physiological chalybeate. Associated as it is with the phosphates of the blood, it forms the most powerful of tonics, and at the same time a most nourishing food. It is especially useful in cases of *Anœmia, Chlorosis, Cachexias, Exhaustion* caused by excess of work, nervous debility, fatigue resulting from parturition and lactation. It replaces entirely liquid blood, which has been recommended and used with success in *Phthisis* and *wasting away.*

It is offered in two forms: In cachets (wafers), 60 of which are contained in a box; combined with chocolate in small squares, 30 of which are in a box; both forms can be sent by mail.

Prepared by C. CRINON, Paris, Pharmacist of the first class, Laureate of the Hospitals of Paris. Samples may be obtained by application to

E. FOUGERA & CO., New York, Agents for the U. S.

FOUGERA'S COMPOUND IODINISED
COD LIVER OIL.



Since the introduction of this oil in 1858, it has been found to be superior to all other kinds of Cod Liver Oil for the treatment of **General Debility, Consumption, Scrofula, Rickets, etc.**

It possesses not only all the **nourishing** qualities of the best Cod Liver Oil, but also the **tonic, stimulant** and **alterative** properties of **Iodine, Bromine** and **Phosphorus,** which are added in such proportions as to render it therapeutically five times as efficacious as pure Cod Liver Oil.

Through its **increased curative action, FOUGERA'S COD LIVER OIL** will be found to cure disease in a much shorter time than the pure oil; while favorable results will be obtained by its use in many advanced cases when the pure Cod Liver Oil would fail entirely.

FOUGERA'S READY-MADE MUSTARD PLASTERS.

A most useful, convenient, clean, and economical preparation. Not liable to change, if kept in a dry place. Made of two strengths. Plasters No. 1, of pure mustard; Plasters No. 2, of one-half mustard. Price 40 cents, the tin box, or tin roll, of 10 plasters each. DIRECTIONS.—Dip the Plaster, or Plasters, a minute or two, in cold water; apply on the part, and cover with a band.

FOUGERA'S COMPOUND ICELAND MOSS PASTE.

(Iceland Moss, Lactucarium Ipecac and Tolu.)

Used with great success against nervous and convulsive coughs, Whooping Cough, Acute Bronchitis, Chronic Catarrh, Influenza, etc.

Wakefulness, Cough, and other sufferings in Consumption, are greatly relieved by the soothing and expectorant properties of this Paste.

FOUGERA'S IODO-FERRO-PHOSPHATED ELIXIR OF HORSE-RADISH.

This Elixir contains Iodine, Pyrophosphate of Iron, the active principles of antiscorbutic and aromatic plants, and acts as a **tonic, stimulant, emmenagogue,** and a **powerful regenerator of the blood.** It is an invaluable remedy for all constitutional disorders due to the impurity and poverty of the blood. One of the advantages of this new preparation consists in combining the virtues of Iodine and Iron without the inky taste of Iodide of Iron.

SOLD BY DRUGGISTS GENERALLY.

PNEUMATIC ASPIRATION,

AFTER THE MANNER OF DIEULAFOY.

"It is always possible, owing to Aspiration, to search for a fluid collection without any danger, whatever may be its seat or its nature."

"I have thrust these needles into almost every part of the body; into the Joints, the Liver, the Spleen, the Bladder, the Intestines, the Lungs and the Meninges; and I can affirm, and a great number of observers affirm with me, that we have never seen consecutive accidents."—*Dieulafoy on Pneumatic Aspiration*, pp. 21, 24.

We invite the attention of the Medical Profession to this New Apparatus for Aspiration, constructed upon the general plan of Potain's modification of Dieulafoy's Aspirator, but containing the following improvements and inventions of our own:—

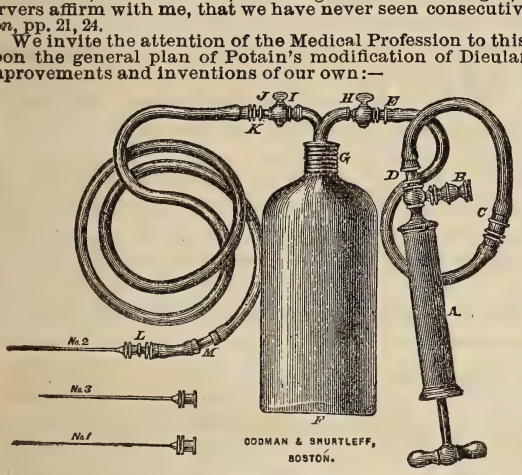

Fig. 77.

Fig. 68.

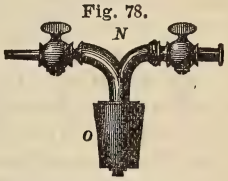

Fig. 78.

The Stopper and Cocks supplied with Apparatus No. 2.

1st. Means of changing the pump from an exhaust to a force-pump, and *vice versa*, thereby enabling the operator not only to draw an abnormal fluid, but to inject the cavity through the tubes and needle of the apparatus with one adapted to induce healthy action.—*See Dieulafoy on Aspiration*, pp. 276, 278.

2d. The employment, in our apparatus No. 1, of a metal Screw Cap, fitting the neck of the receiver supplied with this apparatus so securely that it cannot be forced from its place by condensed air while injecting, or accidentally removed while the receiver is in a state of vacuum for aspiration

3d. The substitution, for the ordinary oiled silk valves of other apparatus, of a kind indestructible, both in form and material.

4th. A simple and comparatively inexpensive attachment for evacuating the contents of the stomach, equal, if not superior, to any in use hitherto.

Commendations bestowed upon our Aspirators, by physicians familiar with the latest European and American ones, lead us to believe that, in some important particulars, at least, they are superior to any.

In his work on Pneumatic Aspiration, Dieulafoy shows the harmlessness of the Aspiratory puncture, and its great superiority to the Exploring Trocar as a means of accurate diagnosis in all collections of Pathological Fluids. It has been used with unprecedented success in the Retention of Urine, Reduction of Strangulated Hernia, in Ascites, Hydrothorax, Empyema, Pneumothorax, Effusions into the Pericardium, Serous, Purulent and Hematic Effusions of the Knee, Hydrocele, Hydatid Cysts, Abscesses of the Liver, and in various other Pathological Lesions.

PRICES OF APPARATUS.

No. 1. Air Pump—exhaust or condensing as described; 16 oz. receiver, of strong glass, with screw-cap; three steel, gold plated Aspiratory Needles, together with the necessary tubes, stop-cocks, etc., as shown in Fig. 77, fitted in a neat case, accompanied with printed directions $16.00. Postage 64 cents.

No. 2. The same, without receiver, and with rubber stopper (see Fig. 78) to fit almost any bottle of quart capacity, or less, instead of screw-cap arrangement, also with printed directions $14.00. Postage 32 cents.

No. 3. Dieulafoy's Notched Aspirator, Nickel-plated, with two Needles, Tubes, etc., in case..... $14 00

No. 4. Stomach Attachment, as described, adapted to pump accompanying Nos. 1 and 2, additional $6.00. Postage 22 cents.

The foregoing are the product of our own factory, and are warranted in every respect.

Also, **Dieulafoy on Pneumatic Aspiration,** post-paid, by mail, on receipt of..... 3 40

☞ *Full description on application.*

TROMMER'S EXTRACT OF MALT.

The rapidly increasing demand for our IMPROVED EXTRACT OF MALT, during the four years that it has been manufactured and offered to the medical profession in America, justifies the belief that in its production here we are meeting a generally felt want.

Long experience in manufacturing Malt Extract has enabled us to completely overcome the many difficulties attending its manufacture in large quantities; and we positively assure the profession that our Extract of Malt is not only perfectly pure and reliable, but that it will keep for years, in any climate, without fermenting or moulding, and that its flavor actually improves by age. Our Extract is guaranteed to equal, in every respect, the best German make, while, by avoiding the expense of importation, it is afforded at less than half the price of the foreign article.

The Malt from which it is made is obtained by carefully malting the very best quality of selected Toronto Canada Barley. The extract is prepared by an *improved process*, which prevents injury to its properties or flavor by excess of heat. **It represents the soluble constituents of Malt and Hops**, viz: MALT SUGAR, DEXTRINE, DIASTASE, RESIN and BITTER of HOPS, PHOSPHATES of LIME and MAGNESIA, and ALKALINE SALTS.

Attention is invited to the following analysis of this Extract, as given by S. H. Douglas, Professor of Chemistry, University of Michigan, Ann Arbor.

TROMMER EXTRACT OF MALT CO:—I enclose herewith my analysis of your Extract of Malt:—
Malt Sugar 46.1; Dextrine, Hop-bitter, Extractive Matter, 23.6; Albuminous Matter (Diastase), 2.469; Ash—Phosphates, 1.712. Alkalies .377; Water, 25.7; Total, 99.958.
In comparing the above analysis with that of the Extract of Malt of the German Pharmacopœia, as given by Hager, that has been so generally received by the profession, I find it to substantially agree with that article.

Yours truly, SILAS H. DOUGLAS,
Prof. of Analytical and Applied Chemistry.

This invaluable preparation is highly recommended by the medical profession, as a most effective therapeutic agent, for the restoration of delicate and exhausted constitutions. It is very nutritious, being rich in both muscle and fat-producing materials.

The very large proportion of *Diastase* renders it most effective in those forms of disease originating in *imperfect digestion of the starchy elements* of food.

A single dose of the Improved Trommer's Extract of Malt contains a larger quantity of the active properties of Malt than a pint of the best ale or porter; and not having undergone fermentation, is absolutely free from alcohol and carbonic acid.

The dose for adults is from a dessert to a tablespoonful three times daily. It is best taken after meals, pure, or mixed with a glass of milk, or in water, wine, or any kind of spirituous liquor. Each bottle contains 1½ pounds of the Extract.

Our preparations of Malt are for sale by druggists generally, throughout the United States and Canada, at the following prices:—

EXTRACT OF MALT,	*With*	*Hops (Plain)*,		$1.00
"	"	"	*Pyrophosphate of Iron (Ferrated)*,	1.00

LIGHT-BROWN

COD LIVER OIL

SELECT MEDICAL OPINIONS.

Sir HENRY MARSH, Bart., M.D., T.C.D.,
Physician in Ordinary to the Queen, in Ireland.

"I have frequently prescribed Dr. De Jongh's Light-Brown Cod-Liver Oil. I consider it to be a very pure oil, not likely to create disgust, and a therapeutic agent of great value."

Dr. JONATHAN PEREIRA, F.R.S.,
Author of
"The Elements of Materia Medica and Therapeutics."

"It was fitting that the author of the best analysis and investigations into the properties of Cod-Liver Oil should himself be the purveyor of this important medicine. I know that no one can be better, and few so well, acquainted with the physical and chemical properties of this medicine as yourself, *whom I regard as the highest authority on the subject.* The Oil is of the very finest quality, whether considered with reference to its color, flavor, or chemical properties; and I am satisfied that for medicinal purposes no finer oil can be procured."

Dr. EDWARD SMITH, F.R.S.,
Medical Officer to the Poor-Law Board of Great Britain.

"We think it a great advantage that there is one kind of Cod-Liver Oil which is universally admitted to be genuine—the Light-Brown Oil supplied by Dr. De Jongh. It has long been our practice, when prescribing the Oil, to recommend this kind, since, amidst so much variety and uncertainty, we have confidence in its genuineness."—(Extract from "Consumption: Its Early and Remediable Stages.")

Dr. PROSSER JAMES,
Lecturer on Materia Medica and Therapeutics at the London Hospital.

"I have always recognized your treatise on Cod-Liver Oil as the best on the subject, and adopted its conclusion as to the superiority of the Light-Brown over the Pale Oil. I have the less hesitation in expressing myself in this sense since I am only endorsing the opinion sent to you more than twenty years ago by Dr. Pereira, my illustrious predecessor in the chair of Materia Medica at the London Hospital."

Sir G. DUNCAN GIBB, Bart., M.D., LL.D.,
Physician and Lecturer on Forensic Medicine, Westminster Hospital.

"The experience of many years has abundantly proved the truth of every word said in favor of Dr. De Jongh's Light-Brown Cod-Liver Oil by many of our first Physicians and Chemists, thus stamping him as a high authority and an able Chemist, whose investigations have remained unquestioned."

Dr. LETHEBY,
Medical Officer of Health, and Chief Analyst to the City of London.

"In all cases I have found Dr. De Jongh's Light-Brown Cod-Liver Oil possessing the same set of properties, among which the presence of cholaic compounds, and of iodine in a state of organic combination, are the most remarkable. It is, I believe, universally acknowledged that this Oil has great therapeutic power; and, from my investigations, I have no doubt of its being a pure and unadulterated article."

Dr. BANKS,
King's Professor of the Practice of Physic at the University of Dublin.

"I have, in the course of my practice, extensively employed Dr. De Jongh's Light-Brown Cod-Liver Oil, and I have no hesitation in stating that I consider it the best of all the specimens of oil which have ever come under my notice. The fact of so able and accurate an observer as Dr. De Jongh subjecting the Oil to careful analysis previous to its exposure to sale, is a sufficient guarantee of its purity and excellence."

Dr. EDGAR SHEPPARD,
Professor of Psychological Medicine, King's College, London.

"Dr. Sheppard has made extensive use of Dr. De Jongh's Light-Brown Cod-Liver Oil, and has great pleasure in testifying to its superiority over every other preparation to be met with in this country. It has the rare excellence of being well borne and assimilated by stomachs which reject the ordinary Oils."

DR. DE JONGH'S LIGHT-BROWN COD-LIVER OIL is supplied ONLY in bottles sealed with BETT'S Patent Capsule, impressed on the top with Dr. DE JONGH'S Stamp, and on the side with his Signature, and the Signature of ANSAR, HARFORD & CO., and bearing under the wrapper a Label with the same Stamp and Signatures. WITHOUT THESE MARKS NONE CAN POSSIBLY BE GENUINE.

Sold in IMPERIAL half-pints, $1.00, by the Principal Druggists in the UNITED STATES.

SOLE CONSIGNEES,

THE WEEKLY
MEDICAL AND SURGICAL REPORTER.

THE MEDICAL AND SURGICAL REPORTER has been established over thirty years, and has, it is believed, a *bonâ fide* subscription list unsurpassed by any medical weekly in America.

It is issued every Saturday, neatly cut and bound, and gives 24 large octavo, doubled-columned pages of reading matter in each number. It claims the following

SPECIAL FEATURES:

IT IS INDEPENDENT, being controlled by no clique, college, society or publishing house.

COSMOPOLITAN. Having subscribers and contributors in every State in the Union, it is edited in the interest of the *whole profession*, not of one section or locality.

EMINENTLY PRACTICAL. Special prominence is given to Diagnosis and Therapeutics—the *recognition* and the *treatment* of disease, the real *business* of the professional man.

UNSURPASSED IN CHEAPNESS. When the *size* and *number* of its pages, and its frequency of issue are taken into account, it gives more matter for the money than any other medical journal in this country.

PARTICULARLY SUITED TO COUNTRY PHYSICIANS. It has always been a special aim of the editor to furnish a journal that would keep a reader remote from medical centres *fully up to the times* in his profession. Every surgical invention and new remedy of value, every medical book of moment, every professional discussion or news item of interest, will be found recorded in its pages. *Contributions* from country physicians are always welcome.

THE HALF-YEARLY COMPENDIUM

Appears on January 1st and July 1st of each year, forming two semi-annual volumes of 300 large octavo pages each, with complete Index. It has been established ten years, with a constantly growing circulation.

☞ While complete in itself, it is also intended as a **Companion Journal to the Medical and Surgical Reporter**; it is made up from articles *which have not been included* in the latter. The one journal is the Complement of the other.

From 600 to 700 separate articles appear each year in its various departments, carefully prepared, and giving the choicest selections from all sources, American and Foreign. It is the *only* work of the kind which does justice to *American* writers in medicine.

The Physician's Daily Pocket Record,

BETHESDA WATER.

We claim Bethesda to be a specific in all cases of Diabetes, Inflammation of the Kidneys, Inflammation of the Bladder, Inflammation of the Neck of the Bladder and Urethra, Dropsy, Gouty Swellings, Stoppage of Urine, Incontinence of Urine, Albuminuria, Ropy or Cloudy Urine, Brick-dust Deposit, thick, morbid, bilious and dark-appearing Urine, with bone-dust Deposits, burning sensation with sharp pains when voiding the Urine, Hemorrhage of the Kidneys, Pain in the Kidneys and Loins, Torpid Liver, Indigestion, Calculus and Female Weakness.

What the Medical Profession Say.

MILWAUKEE TESTIMONIALS.

(Milwaukee is 20 miles from the Spring.)

What Surgeon-General Wolcott and other prominent medical men say about the Bethesda Water:—

DR. WOLCOTT—Dear Sir: My attention has lately been called to the Bethesda Mineral Water, of Waukesha, as a remedy for Diabetes, Bright's Disease, etc., and I desire, in behalf of an afflicted friend, to ask of you the favor of submitting briefly your views of its merits, or its claims to the confidence of the profession as a medical agent in the maladies named, and you will much oblige, J. W. RIGGS, M.D.

J. W. RIGGS, M.D.—Dear Sir: Many cases of Diabetes and other forms of Urinary Disorders have been cured or greatly relieved by the use of the water; so much so that the Spring has already a wide-spread reputation. What time may do, either in sustaining or destroying this rapidly acquired reputation, remains to be seen. It is a test too severe for most very rapidly famous remedies, but this may, nevertheless, stand it. Very respectfully,

E. B. WOLCOTT, M.D.

Two years after the above was written, Dr. Wolcott says—

I am gratified to find that the opinion given by me over two years ago, on the medical properties of the Bethesda Water, has been fully sustained and confirmed by its use, in a vast number and great variety of cases involving the urinary organs. In many, nay, in most of such cases, I do not hesitate to say that it is vastly superior to any other remedy known to the profession. E. B. WOLCOTT, M.D.

We fully concur in the above.

O. P. WOLCOTT, M.D.
J. E. GARDNER, for diabetes.
H. XELOWSKI, M.D.
J. M. ALLEN, M.D.

What Dr. Thompson (late Surgeon in charge of National Asylum) says about the Bethesda Water:—

I have known many acute and Chronic diseases of the kidneys and urinary organs permanently relieved by the use of Bethesda Spring Water after resisting ordinary medical treatment. I regard the water as possessing remarkable medicinal properties, and have observed its effects for the past two years.

J. H. THOMPSON, M.D.
Late Surgeon in charge National Asylum, 210 Wisconsin street, Milwaukee.

What Dr. Marks (late President Wisconsin Medical Society) says about Bethesda Water:—

During the past two years I have prescribed Bethesda Water for quite a number of patients who were suffering from diabetes, and unhesitatingly pronounce it *the best* remedy I have used for that disease.

S. MARKS, M.D.

General Agent for this Water, for the States of Pennsylvania, Indiana, Ohio, West Virginia, New Jersey and Maryland—

THE POST-OFFICE LAWS

Forbid anything of an oleaginous nature being sent through the mail.

THEOPHILUS REDWOOD, Ph.D., F. C. S., Professor of Chemistry and Pharmacy to the Pharmaceutical Society of Great Britain, says, in reference to this preparation:—

"UNGUENTUM PETROLEI appears to be obtained from crude Petroleum by fractional distillation and subsequent purification. Products of a similar description have been introduced in pharmacy, and recommended as substitutes for animal or vegetable fats in the preparation of ointments or liniments.

"Among these the UNGUENTUM PETROLEI is distinguished by its having a firmer consistence and a higher melting point, and in these respects it resembles pure lard, from which it differs in that it is entirely free from liability to become rancid or to undergo any chemical change. It has an amber color, and a smooth, jelly-like appearance and is almost wholly free from odor or taste. It is free from, and insoluble in, water. It is very slightly soluble in rectified spirit, but very soluble in ether, in fixed oils and fats. I am of opinion that its characters and properties are such as to render it a valuable adjunct to our Materia Medica."

Dr. TILBURY FOX, London, writes:—"I like the UNGUENTUM PETROLEI very much indeed, and shall not fail to prescribe it."

From "THE LANCET," London, October 20th, 1878.—"Semi-transparent, pale yellow in color, and perfectly free from offensive smell. We consider it a valuable preparation, and hope its use will become as common in England as it is said to be in America."

From "THE MEDICAL TIMES AND GAZETTE," London, October 20th, 1878.—"The substance introduced under the name of UNGUENTUM PETROLEI is of about the consistence of good lard, has no smell, keeps any length of time, apparently without becoming rancid, and may be exposed to any kind of atmosphere without undergoing chemical change. It has long been, we understand, in use in America, where it enjoys a wide-spread popularity; and it will, we doubt not, come into extensive use here also, as a vehicle for making ointments, as a demulcent in various diseases of the skin, and as a lubricant."

LONDON MF'G CO.'S ESSENCES OF MEATS

FOR INVALIDS, INFANTS AND TRAVELERS.

ESSENCE OF BEEF, MUTTON, CHICKEN.

These Essences are the finest juices from choice meats, entirely free from fatty or injurious matter. They retain the fine flavor and smell of the meats. Are heavy liquids in a warm temperature and when placed upon Ice take a jelly form especially grateful to invalids. Children will readily take them, and in many of their complaints Essences are unequaled. Being used **WITHOUT WATER,** *they do not cause nausea as does Beef Tea, and they will remain upon the stomach when all other nourishment is rejected. In mental or physical prostration they act as strong stimulants, without the subsequent injurious effects produced by alcohol. In Dyspepsia and all Chronic Diseases of the Stomach, they are easily assimilated and are helpful in Consumption and other wasting diseases. Natural, pleasant and refreshing in fevers. Afford concentrated meat stimulant after child-birth. Are convenient for persons boarding or traveling.*

Taken cold direct from the can, needing no preparation whatever.

Sold by Druggists and Fine Grocers.

TO THE MEDICAL PROFESSION.

MALTINE.

(Extract of Malted Barley, Wheat & Oats.)

THIS PREPARATION

Contains from three to five times the Medicinal and Nutritive elements found in Extract of Malt.

MALTINE is a highly concentrated extract of malted *Barley*, *Wheat*, and *Oats*, containing, undiminished and unimpaired, all the medicinal and nutritious principles found in these cereals. By the most carefully conducted scientific process we are enabled to offer to the medical profession a perfect article, possessing from *three* to *five times* the therapeutic and nutritive merit of any foreign or domestic Extract of Malt.

In support of our claims we invite the attention of the profession to the following points, viz.:

FIRST.—In the manufacture of **MALTINE** the evaporation necessary to reduce it to its great density is conducted in vacuo, at a temperature ranging from 100° to 120° Fahr.; while most manufacturers of Extract of Malt resort to "open pan" or low pressure steam boiling, by neither of which processes can the extract be so produced as to preserve the Diastase, Phosphates, and Albuminoids, on which its remedial value so greatly depends, and the product is either of a dark color or of low specific gravity, possessing little virtue aside from the saccharine matter which it contains.*

SECOND.—*Carbon*, *Hydrogen*, *Nitrogen*, *Sulphur*, *Iron*, *Magnesium*, and *Potassium*, are essential elements in the food of man, and it is only in **MALTINE**, containing the combined properties of malted *Barley*, *Wheat*, and *Oats*, that all these principles can be found in the proper proportions; Extract of Malt made from *Barley alone* is wanting in some of the most important of these elements.

THIRD.—*Gluten* is the most nutritious principle found in the cereals, and is the only vegetable substance which will, alone, support life for any great length of time. It is composed of three distinct nitrogenous principles, together with fatty and inorganic matters, and is analogous to animal fibrin. **MALTINE** contains twenty times the quantity of *Gluten* found in any Extract of Malt.

FOURTH.—Liebig says, "Wheat and Oats stand first among our list of cereals in combining all the elements in proportions necessary to support animal life. They are especially rich in muscular and fat producing elements." The only reason we use Malted Barley, in the manufacture of **MALTINE**, is that it contains larger proportions of mineral matters (bone producers) and Diastase. It is deficient in all other essential elements.

We believe that any practitioner will readily recognize the superiority of MALTINE, and would request a trial and comparison of merits with any article offered for similar uses.

* As a sure test for Diastase, and the Albuminoids, a small quantity should be put in a test tube or small vial, largely diluted with water, and heated to the boiling point, when the Albumen, if present, will coagulate, and appear in little flocculent particles throughout the liquid. If the extract remains clear, it is proof that it has already been coagulated by excessive heat, and removed by filtration during the process of manufacturing. Any heat which will coagulate Albumen will inevitably destroy the digestive power of Diastase.

The Nitrogenous constituents of *MALTINE* have a composition identical with that of the chief constituents of the Blood, and therefore contain nearly every element requisite for the reproduction of the human body.

MALTINE AND ITS COMPOUNDS

can undoubtedly be used with greater success than any other remedy now known, in cases of general and nervous Debility, Indigestion, imperfect Nutrition and deficient Lactation; Pulmonary affections, such as Phthisis, Coughs, Colds, Hoarseness, Irritation of the Mucous Membranes and difficult expectoration; Cholera Infantum and wasting diseases of children and adults; Convalescence from Fevers, and whenever it is necessary to increase the vital forces and build up the system.

WE MANUFACTURE THE FOLLOWING PREPARATIONS, THE FORMULÆ AND DOSES OF WHICH ARE GIVEN IN OUR DOSE BOOKS, AND ON THE LABEL ATTACHED TO EACH BOTTLE:

***MALTINE* WITH HOPS.**

***MALTINE*, FERRATED:**

This combination is specially indicated in Anæmia and Chlorosis, and in all cases of defective nutrition where Iron is deficient in the system.

***MALTINE* WITH PHOSPHATES IRON AND QUINIA:**

A powerful general and nutritive tonic.

***MALTINE* WITH PHOSPHATES IRON, QUINIA AND STRYCHNIA:**

A powerful nutritive, general and nervous tonic.

***MALTINE* WITH PEPSIN AND PANCREATINE:**

One of the most effective combinations in Dyspepsia, Cholera Infantum, and all diseases resulting from imperfect nutrition. It contains three of the all-important digestive agents, Diastase being one of the constituents of the *MALTINE*. We believe there are few cases of Dyspepsia which will not readily yield to the medicinal properties of the above combination, while the system is invigorated by its nutritive qualities.

***MALTINE* WITH BEEF AND IRON:**

One of the most valuable combinations in cases of General Debility, when there is deficient nutrition and a deficiency of Iron in the system.

***MALTINE* WITH ALTERATIVES:**

In this preparation *MALTINE* is combined with the most valuable Alteratives known, such as Iodides, Bromides and Chlorides, and will fully meet the requirements of the practitioners in Syphilis, Scrofula, and all depraved conditions of the blood.

MALTINE WINE.

This preparation contains all the medicinal and nutritive constituents of *MALTINE*, less 60 per cent. of the transformed starch or glucose, which renders the preparation lighter and more acceptable to some stomachs, and is recommended only in such cases.

***MALTINE WINE* WITH PEPSIN AND PANCREATINE:**

(Each fluid ounce of MALTINE WINE contains 15 grains pure PEPSIN and 15 grains pure PANCREATINE).

We can recommend this preparation to the Medical Profession as being the most important remedy ever brought to their notice in all cases of Dyspepsia and Imperfect Nutrition, when the system needs invigorating and replenishing. It will be found, we believe, a perfect remedy in Vomiting in Pregnancy, Cholera Infantum and wasting diseases of children, and in Constipation and Chronic Diarrhœa resulting from mal-nutrition. It will agree with the most irritable stomach.

MALTO-YERBINE.

(Each pint of the above preparation contains 13 ounces MALTINE, 2 ounces CARRAGEEN and 1 ounce YERBINE).

With the nutritive, emollient and demulcent properties of *MALTINE* and *CARRAGEEN*, and the expectorant qualities of *YERBINE* (active principle of Yerba Santa), we offer this preparation to the Profession with the fullest confidence that it is the most perfect remedy yet produced in Chronic Pulmonary Affections, Irritation of the Mucous Membrane, Difficult Expectoration, Bronchitis and ordinary Coughs and Colds.

The Dose of all Preparations of *MALTINE* and compounds is from a dessert to a tablespoonful.

We also manufacture a perfectly prepared EXTRACT OF MALT, from *Barley only*.

MALTINE preparations are sold at the same prices as EXTRACT OF MALT and its combinations, and are put up in half-pint, pint and five-pint amber bottles; each bottle inclosed in a folding paper box.

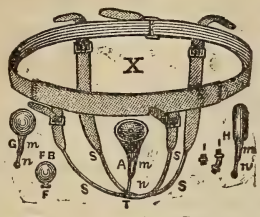
STAUFER'S
HARD RUBBER INSTRUMENTS AND PRICE LIST.

SERIES OF UTERINE SUPPORTERS. 1.



Spring Stem Cup A.—Complete on Belt X, $7.00; on XX, $9.00; on Y, $8.00; and on Z, $6.00. Without belt on SS, $5.00.

Anteversion C, Globe Top G, and Oblong H, in price the same as A, with similar attachments.

Retroversion E, on Belt X, $8 00; on XX, $10.00; on Y, $9.00; and on Z $7.00. Without Belt $6.00

Duplicate Cups—A, $2.00; E, $3 00; Globe Tops G, with attachments to screw on A or E Stem $2.00.

P. S.—Shifting Top, with solid or no Spring Stem, 50 cents less on either belt. No Shifting Top Stem sold alone.

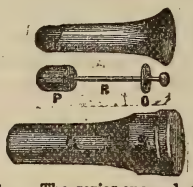
Self-Sustaining Globe B, or Cup D, $1.50 each.

Gums are mailed, 2 at 20 cts; 4 at 35 cts; and Springs at 3 cts. each.

Abdominal Supporters. 2. 3.

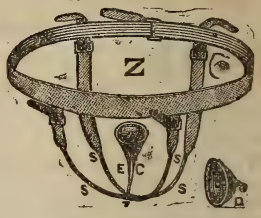
Price, $4.00. Price, $3.00.

SPECULUMS AND CASE. 6.



Prices.—The series encased, $14.00. With complete but non-shifting conductor, $2.50 each. Flesh color enameled inside.

SOLID STEM CUP SUPPORTER E. C. 5.



Price, $4.50. Including Cup D, $6.00. Or E C, on Abdominal Belt X, $5.50. X X, $7.50. Y, $6.50. Including D, on each, $1.50 extra.

REFLECTOR, OR DENTISTS' LIGHT. 10.

Price, $3.50.

Rectum Supporter and Ointment Holder. 4.

$3.50.

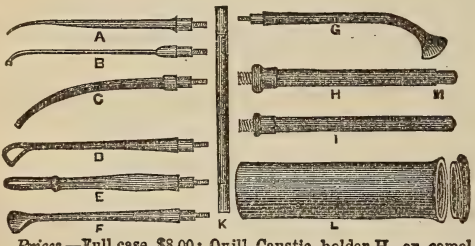
STEM LEVERS. 14.

$4.50 on Z, $7.00 on X.

Permanent Stem I—The same in price as E C, Fig. 5, on all the belts.

Spring Stem J—The same as Spring Stem Cup A, Fig. 1, on either belt.

HARD RUBBER UTERINE EXAMINING CASE. 12.



Prices.—Full case, $8.00; Quill Caustic holder H, or camel hair brush holder and case I, each $1.00. Any two of the first seven, with centre piece K, $2.50.

Penestrated Vaginal and Anal. 7.

Prices.—Vaginal T, $2.00. Anal U, $1.50.

Hymen—Pointed. 8.

Price, $1.50.

Vaginal and Vulva Dilator. 9.

Price, $1.50.

Caustic Bottle and Case. 11.

Price, $1.50.

Price, $1.00.

Price, $1.00. 15.

13.

Supporters E. C. or Economy.—Fig 5, on its elastic belt Z, is the least in price, and by the oblique construction of the cup sets direct within the angle of the axis of the uterus and vagina, (well seen by IU. Fig. 13) If properly selected, or made so by the exchange privilege, (which admits the interchange of all the hard rubber parts in the catalogue, to cover the purchaser's risk.) It is warranted to correct and sustain even any ***Procidentia.*** The spring stems and shifting tops with their supplements, Fig. 1. Also, improved ***Retroversion, Cup E. Anterversion C.*** and ***Intra-Uterine Stem Cup, IU,*** Fig. 13. The stem locks in a square socket after the cup is in position, and is supported on the elastic gums SS, as A Fig. 1, and same in price. Stem Levers, Fig. 14, etc. All are fully explained in the catalogue. The ***Series*** comprises upwards of 150 in style and size instruments, of which two-thirds belong to the support and correction of the uterus. ***Speculums***—Thomas' objections p. 67—'76, are by them completely overcome. The case contains four. The clear and large view, and facility to work through them, far exceeds any other. The ***Ex. Case,*** and physician's favorite, is admirably represented by Fig. 12—weight but 4 oz. ***Catalogue*** sent free on application. In addition to the description of the above series of instruments, it contains important information on this line of treatment.

SPECIAL FACTS CONCERNING

BELLADONNA PLASTER

IN RUBBER COMBINATION.

PREPARED BY

SEABURY & JOHNSON.

In undertaking the manufacture of Medicinal Plasters we had but one object in view—THE IMPROVEMENT OF ALL KINDS OF PLASTERS. Among the various plasters manufactured by us was BELLADONNA PLASTER. This article met with a larger demand than some of the others, acquired a reputation among the best druggists, and received the confidence of the profession. Its large sale interfered with rival manufacturers, and continuous efforts have been made on their part to prejudice physicians against it.

As these attacks have been of late more malicious than usual, we have deemed it advisable, in self-defence, and in order to place our article fairly before the practitioner, to assign reasons why we consider it the most thoroughly reliable preparation ever offered the medical profession. First, it is a combination of the Alcoholic Extract of Belladonna only, with purified rubber, and thus possesses all of the advantages of the rubber base, being pliable, convenient of application, and not subject to the deteriorating influence of age, as is the case when any other base is used. Secondly, it is freed from all irritative properties. Thirdly, it is more adhesive than any other plasters. Fourthly, we believe it to be as perfect, in every respect, as it is possible to make a Belladonna plaster.

ENGLISH EXTRACTS—WHY WE DO NOT EMPLOY THEM.

Imported English Extracts are prepared from the Inspissated Juice of the leaf, while our pharmacopœia formula is treated by Alcohol. The active principle of Belladonna (Atropia) is only partially obtained by Inspissation. The employment of Alcoholic or Hydro-Alcoholic Solvents completely exhausts the entire strength of the drug.

The value of both preparations is clearly presented in an able treatise published in the *American Journal of Pharmacy*, April 1876, page 145. Our own investigations are substantially identical :—

TABLE OF RESULTS,

	Test solution requisite for 100 cc. of Ext. Solution.	Percentage of Atropia in Extract.
BXT. BELLADONNÆ ALCOH. U. S. P.	*17·732*	*2·571*
GEO. ALLEN & CO., English	*9·73*	*1·411*
*HERRINGS & CO., " *	*8·133*	*1·179*
E. MERCK, Germany (aqueous extract), made 1869	*1·9*	*·275*

This analysis clearly establishes the fact that the **Alcoholic Extract of Belladonna of the U. S. P. averages over twice the strength of English Extracts,** and should, therefore, be preferred in all cases where a reliable article is desired. Inspissated and Aqueous Extracts deteriorate, while Alcoholic remain stable.

Therefore the assumption of pretentious manufacturers, that the English Extracts are the superior preparations, must be based on a former supposition rather than present facts. The following analysis substantiates our claim regarding English Extracts.

ANALYSIS OF BELLADONNA PLASTERS, BY PROF. R. OGDEN DOREMUS.

"BELLEVUE HOSPITAL COLLEGE, New York, Sept. 7, 1878.

"GENTLEMEN—I obtained from Messrs. W. H. Schieffelin & Co., of this city, samples of Belladonna Plasters prepared by Grosvenor & Richards, Boston ; Mitchell Novelty Plaster Works ; Seabury & Johnson, New York and London. I have examined these varieties for the purpose of determining which possesses the largest quantity of Atropine. I employed equal surfaces of each, and *my analysis demonstrated that* SEABURY & JOHNSON'S *contains the greatest proportion* of the active principle of Belladonna. "R. OGDEN DOREMUS, M.D., L.L.D."

Belladonna Plaster, prepared by Seabury & Johnson, is packed in elegant tin cases, which contain 1 yard each, and can be obtained of almost any druggist throughout the United States and Canada, or will be furnished direct by mail. Samples sent on application.

SEABURY & JOHNSON,

Address

R. A. GIVEN, M.D.,

1056 *Burn-Brae, Kelleyville, Del. Co., Pa.*

TO PHYSICIANS.

—:o:—

In order to facilitate the introduction of the metric system, as well as to furnish a convenient posological table, we have published a Visiting List Dose Book, in which the doses are given both in the metric and in the apothecaries' weights and measures. It is light, and neatly bound in flexible silk covers, so that it may be carried in the visiting list or pocket, without inconvenience. This little book renders the use of the metric system easy and attractive, even to old practitioners. All physicians interested in the advancement of our science are urged to aid us in placing this little book in the hands of the profession, not only by sending for it themselves, but by ordering it for their friends. Sent free on receipt of six cents in postage.

Address, THE METRIC CLUB, 637 West Adams Street, Chicago. 1141-1149x

WALNUT HILL,

HARTFORD, CONN.

CHARTERED IN 1874.

An Asylum Home for the treatment of *Inebriates* and *Opium Cases.*

Admirably situated, with ample legal powers of control; based on the fact, confirmed by science and experience, that *Inebriety* is both a physical and mental disease, curable as other diseases are, requiring special treatment in asylums, and in all cases relieved and benefited.

A limited number of patients received, and special facilities provided for each case. The objects sought are rest and building up the diseased organism. Among the means employed are, Turkish baths, electricity, tonics, lectures, amusements, and mental diversion, with exact military and hygienic surroundings. For further information address

T. D. CROTHERS, M. D., Superintendent,
1142-1167. Walnut Hill, Hartford, Conn.

DEXTRO-QUININE.

Equal to Sulphate of Quinine IN THE SAME DOSE——rarely causes, even in large doses, any Cerebral distress or irritability of the Stomach——less than one-half as costly as Sulphate of Quinine.

From recent letters recording CLINICAL EVIDENCE OF THE VALUE OF DEXTRO-QUININE, we extract the following:—

Living in a highly malarious district, and having long felt the want of a reliable substitute for Quinine, I resolved to give your preparation of *Dextro-Quinine* a thorough trial. To show what success I have had by the above preparation, I append the following cases:—

CASE I.—Mrs. T., a washerwoman, consulted me in November, for "*Chills.*" By inquiry I learned that she had had a paroxysm every day for about two months. She had taken *Sulphate of Quinia* and *Cinchonidia*, without effect. I prescribed the following, in pill form: R.—Dextro-Quinine, gm. 1.33, Ext. Aconite Rad., gm. .066, made into three pills, which she took during the night, which interrupted the paroxysm of the following day, as she informed me when I again saw her. I subsequently prescribed a repetition of the above prescription, "to make assurance doubly sure," and she has since had no return of the *Chills*.

CASE II was that of my brother. Had *Remittent fever* last August, since which time he has had regular exacerbations of fever, preceded by a well marked *chill*, every other day. He took *Sulphate of Quinia, pro re nata*, without interrupting the paroxysms. Having had such excellent results from Dextro-Quinine in previous cases, I prescribed the following, in pill form, with the most happy result: R.—Dextro-Quinine, gm. 2.00, Ext. Hyoscyamus, gm. 23. The mass was made into ten pills, and one given every three hours in stage of apyrexia. He has had no return of the paroxysms since.

CASE III.—Mrs. H., aged about 50 years, was taken with Remittent fever. She informed me that she had had an attack of the above fever every summer or autumn for three or four years, during which time she was usually sick from two to three weeks. I prescribed, among other things, R.—Dextro Quinine, gm., 1.33 Ext. Hyoscyamus, gm. 20, made into capsules, No. vi, one to be taken every three hours. Prescription refilled, and in a week's time she was convalescent.

K&M
One Ounce
DEXTRO-QUININE
"K&M."
COMPOSITION C40. H46. N4. O3.
DEXTRO-GYRATE WITH POLARIZED LIGHT.
This article is prepared from commercial purified Chinoidine and consists of the 'Amorphous Quinine' of Liebig or the Diconchinia of Hesse. It is equal to Sulphate of Quinine in the same dose, while in price it is less than one half as costly.
MANUFACTURED BY
KEASBEY & MATTISON.
CHEMISTS,
PHILADELPHIA, U.S.A.

Price, $1.50 per Ounce.

The above is a synopsis of three cases in which I have used Dextro-Quinine, which I consider typical of the types they represent. I have used the above treatment in twelve or thirteen cases with uniform success. My experience, I think, fully accords with that of other physicians of this city who have given it a thorough trial. I usually prescribe Dextro-Quinine in doses of gm. 33 to an adult, combined either with extracts of Hyoscyamus, Aconite, or Pulvis Ipecacuanhæ Comp. From gm. 2.00 to gm. 2.66, combined with one of the above drugs, will usually interrupt a paroxysm of intermittent fever. There are no nervous phenomena, such as *Tinnitus Aurium*, etc., manifested, as there are by the use of Sulphate of Quinia. In conclusion, I will say that Dextro-Quinine is a valuable substitute for Sulphate Quinine, and besides its cheapness is a great consideration to the people, as it is within the reach of all.

I am yours, etc.,
C. C. DUNLAP, M.D.,
Chillicothe, Ohio.

Mr. John Nipgen, a leading druggist of Chillicothe, Ohio (a highly malarious district), says, in a recent letter to us, "*Dextro-Quinine* has almost superseded the use of Quinine in this city and vicinity, I get at least three prescriptions for *Dextro-Quinine* to one for Quinine Sulphate."

CASE IV.—Mrs S., æt. 22, married, no children, brunette, suffering from intermittent fever; first paroxysm Nov. 20th, 6 A. M.; again at 4 P. M. Prescribed Cinchonidia sulphate, grs. xxx, chart No. v. One to be taken every two hours.

Nov. 21st. Return of paroxysm at 6 A. M. and 4 P. M. Gave Cinchonidia sulphate, grs. xlv, chart No. v. One to be taken every two hours.

Nov. 22. Return of paroxysm at same time as on preceding days. Prescribed Dextro-Quinine, grs. xx, chart No. v. One to be taken every two hours. No return of chill since that date, and highly pleased with my experience.

N. H. MANRING, M.D.,
Rigdon, Ind.

Where physicians cannot be supplied by their local druggist, we will forward this article by mail, upon receipt of price.

Samples for clinical use furnished free, on application to the manufacturers,

KEASBEY & MATTISON, Chemists,

332 North Front Street, Philadelphia.

TAMAR INDIEN,

A laxative, refreshing, and medicated Fruit Lozenge, agreeable to take, and never causing irritation. Its physiological action assures the immediate relief and effectual cure of

CONSTIPATION, CEREBRAL CONGESTION, HEADACHE, INDIGESTION, BILE, HEMORRHOIDS, etc., etc., by augmenting the peristaltic movement of the intestines, without producing undue secretion of the liquids. Unlike pills and the usual purgatives, it does not predispose to intestinal sluggishness, and the same dose always produces the same effect, that is to say, never needs increasing. These properties render "Tamar" invaluable to the weak and debilitated, and especially to ladies previous and subsequent to their accouchement. It is recommended by the most eminent Physicians of Paris; notably Drs. BELIN and TARDIEU, who prescribe it constantly for the above complaints, and with most marked success.

Prepared by **E. GRILLON,** Pharmacien de 1ère classe, 27 Rue Rambuteau, Paris. To be had of all respectable Chemists throughout the world.

PEPTODYN.

The New Digestive is a combination of the whole of the Digestive Secretions—Pepsine, Pancreatine, Diastase, etc.,

Forming an invaluable remedy in the treatment of all forms of Dyspepsia, and diseases arising from imperfect nutrition.

N. B.—*The success of this Remedy has led to several imitations of it,* which consist largely of Milk Sugar, and, as compared with Peptodyn, are of little or no real value as digestive agents.

SAVORY & MOORE, 143 New Bond Street, London.

PARIS, 1867. Prize Medal.

1868. Silver Medal.

1872. Gold Medal.

BOUDAULT'S PEPSINE

IN POWDER, also WINE, ELIXIR, SYRUP, PILLS, AND LOZENGES OF PEPSINE.

Since the introduction of Pepsine by Boudault in 1854, **BOUDAULT'S PEPSINE HAS BEEN, AND IS STILL CONSIDERED, THE MOST RELIABLE,** as is attested by the awards it has received at the Exhibitions of 1867, 1868, 1872, 1873, and in 1876 at the Centennial Exposition in Philadelphia.

IT IS THE ONLY PEPSINE USED IN THE PARIS HOSPITALS.

Careful tests will enable any one to satisfy himself that **BOUDAULT'S PEPSINE HAS A DIGESTIVE POWER AT LEAST DOUBLE** that of the best Pepsines in the market, and that it is really the cheapest.

It is Sold in 1 ounce, 8 ounce, and 16 ounce Bottles.

Beware of so-called French Pepsines bearing fictitious names, and prescribe Boudault's only.

BLANCARD'S PILLS

OF UNCHANGEABLE IODIDE OF IRON.

Blancard's Pills of Iodide of Iron are so scrupulously prepared, and so well made, that none other have acquired a so well deserved favor among physicians and pharmaceutists. Each pill, containing one grain of proto-iodide of iron, is covered with finely pulverized iron, and covered with balsam of tolu. Dose, two to six pills a day. The genuine have a *reactive silver seal* attached to the lower part of the cork, and a green label on the wrapper, bearing the fac-simile of the signature of

Blancard

Pharmacien, No. 40 Rue Bonaparte, Paris.
without which none are genuine.

BEWARE OF IMITATIONS.

PHOSPHOROLE.

PHOSPHORUS and COD-LIVER OIL

have now an established position throughout the civilized world as important therapeutical agents. A *perfect combination* of the two has long been a desideratum, since they are both of value in the same disorders, while the cases in which one is demanded and the other contra-indicated are exceedingly rare.

The combination in PHOSPHOROLE has the twofold advantage of furnishing *the best possible form* for the administration of *phosphorus*, and *a more effective form* for the administration of *cod-liver oil*.

With regard to the former, it has been decided by the highest chemical and medical authorities that *phosphorus* should be administered *in a free state*, and in a vehicle which ensures its *perfect diffusion*, its *absolute unalterability*, and, as far as possible, its *prompt assimilation* without the gastric irritation to which the ordinary methods of exhibiting the agent give rise. It is well known that pills, emulsions, solutions in ether, chloroform, vegetable oils and resin, etc., have all failed to fulfill one or more of these conditions. Even an ordinary solution of phosphorus in cod-liver oil would not answer the purpose in all respects. We claim, however, that PHOSPHOROLE completely satisfies all the conditions. From the method of preparing it, in an atmosphere of dry carbonic acid, the phosphorus is *entirely dissolved without oxidation*, and by our mode of manipulation *a positive uniformity of strength* is ensured. It is then promptly bottled and sealed, and its *stability and permanence* thus secured. The exact amount of phosphorus in each dose is known, its efficiency is ensured, and the irritant effects upon the stomach are reduced to a minimum by the blandness of the oil. As a means then of administering *phosphorus* in the many cases in which it is indicated as a *nervous tonic and stimulant*, it is claimed that PHOSPHOROLE is the best attainable in the present state of our knowledge.

The value of *cod-liver oil* in phthisis is so familiar to the physician that it is needless to dwell upon it. But the value of *phosphorus* is also universally recognized in this disease, especially when complicated with nervous derangements. The *combination* of the two therefore furnishes a more effective form for the administration of cod-liver oil in the great majority of cases in which that remedy is indicated, and one which will at once commend itself to the profession.

A dose of two teaspoonfuls of PHOSPHOROLE contains $\frac{1}{100}$ of a grain of phosphorus. This dose, when given after a meal, is effective, and not very liable to interfere with digestion. *Phosphorus is cumulative in its action, and should be administered with watchful care.* About $\frac{1}{12}$ grain is considered the largest safe dose, and we rarely need go higher than $\frac{1}{20}$ or $\frac{1}{30}$ of a grain. At the very first appearance of the smallest gastric derangement, the exhibition of phosphorus should be stopped.

PHOSPHOROLE is handsomely put up in pint bottles only, and may be obtained at all first-class druggists throughout the United States.

[EXTRACT FROM DR. HOWARD CANE'S ARTICLE IN THE LONDON LANCET.]

From the great frequency of occurence of acne, and from its manifesting itself on the faces of individuals of both sexes, any therapeutic agent which promises success in this often intractable skin disease will be welcomed by most practitioners. I do not bring the sulphide of calcium forward as a new remedy in the treatment of this disease, for it was recommended some years ago by Dr. Sydney Ringer, but I wish to bring it more prominently into notice as a drug which will often prove of signal service in acne when other means have failed. The success which I attained in my first case which was of a most obstinate nature, led me to try it in others.

CASE 1.—G. R——, a young lady, aged 19, has been troubled for the last five years with acne of the most severe kind. When she first came to me, her face, especially the forehead was thickly covered with acne spots in all stages of development, the inflamed and suppurating papules being very numerous. She stated that she had been to three physicians in London, two of whom are eminent skin physicians. Inquiries into the state of her general health found it was excellent in every respect. Prescribed the sulphide of calcium of which I gave at first one-tenth of a grain four times daily. At the same time I directed her to hold her face over a vessel of hot water night and morning for some ten minutes or more, and then to rub the parts where the little black-topped comedones were very thick with a towel, after which she was to use as a face powder some precipitated sulphur, which I directed to be colored with Armenian bole. At the same time I gave minute and careful directions as to diet, etc., forbidding pastry of all kinds, all salt meats, and enjoined the frequent use of green vegetables, together with regular out-door exercise. At the end of a fortnight I saw her again, and found that there was a slight improvement, there were not many more inflamed papules, and the black-topped comedones were considerably fewer in number. I determined to persevere. I now ordered 1-10 grain to be taken six times daily, and to see me again in a fort night. At the end of that time I again saw her, and, though there was no very great improvement that I could see, still the patient declared she was better. I now increased the dose of the sulphide to one grain daily, and see me again in a fortnight. I now increased the dose to one-fourth of a grain six times daily, with a very excellent result; in another fortnight to half a grain six times daily; and at the end of another fortnight not only but few spots appeared, but they were much less inflamed than usual, and the others were rapidly disappearing, and the complexion was much clearer. To take one grain six times daily for another fourteen days. I then saw her again. From this time the progress was uninterruptedly good. No fresh spots appeared.

CASE 2.—J. C——, a young lady 20 years of age, came to me for an eruption on the face which she had for a year, and which had gradually become worse. I prescribed the same diet and face powder, and gave the same directions as in case 1, but gave to begin with, one-fourth of a grain of the sulphide four times daily, gradually increasing the dose to a grain six times daily. At the end of six weeks she was nearly well, and in another month I saw her again, when she was quite cured. She had taken the sulphide in all two months, gradually diminishing the dose during the fort night. I may here say that this patient also had been taking various drugs for some months previously, but without any appreciable result.

I have before me notes of fourteen other cases treated exactly in the same way, but which I need not detail, as they were merely repetitions of the two given above. The result in eleven out of these fourteen were perfect, whilst in the remaining three, though great benefit was derived, the cure was not complete. I now always begin with a quarter of a grain four times daily, gradually increasing the dose to one grain six times daily, or according to the progress and severity of the case.

RELIABLE

ANIMAL VACCINE.

The undersigned respectfully announces that he has discontinued the practice of furnishing Vaccine *at his residence.*

Physicians can obtain the *Animal Vaccine* of MESSRS. CASWELL, HAZARD & CO., BROADWAY, CORNER 24TH STREET.

FRANK P. FOSTER, M.D.

By our arrangement with Dr. Foster, *all* Vaccine supplied by *us* is *absolutely fresh.*

We can furnish it in any quantity desired, either by express or by mail, if remittance is made to cover postage.

Dr. Foster's Animal Vaccine is the only kind that may be said to have the unqualified endorsement of the Medical Profession of New York.

QUILL SLIPS (half quill, charged on convex surface, at square-cut end).....**25 cts.**
CAPILLARY TUBES.....**$2 00**

For ordinary use *Quill Slips* are the most reliable of all forms of stored Vaccine, and in cases of failure with them in *primary* vaccination, if used within one week of their issue, and strictly in accordance with the printed directions, *being in the meantime kept cool and dry*, a second supply will be furnished gratis.

Tubes are intended chiefly for transportation to long distances, as the virus is preserved for a considerable length of time. They are superior to crusts, but inferior to quill slips.

Crusts are not recommended, and are not sold, for the reason that, however fresh, and however well formed they may be, they are apt to prove inefficient.

CASWELL, HAZARD & CO., New York.

APOLLINARIS

NATURAL MINERAL WATER.

HIGHLY EFFERVESCENT.

Approved by the Academy of Medicine of France, and its sale in France authorized by special decree of the French Government.

"THE QUEEN OF TABLE WATERS."—*London Medical Record.*

PROFESSOR OSCAR LIEBREICH, Professor of Medical Chemistry, University of Berlin:—"After minute personal investigation, I can affirm that the Apollinaris Water is bottled according to all the rules of science, and is an entirely Natural Mineral Water."

PROFESSOR J. A. WANKLYN, Lecturer on Chemistry, St. George's Hospital, London:—"I have thoroughly examined the Apollinaris Spring and the method of bottling. The Apollinaris Water, as supplied to the public, is simply and purely a Natural Mineral water, impregnated only with its own gas."

PROFESSOR MOHR, Medical Councilor, University of Bonn:—"After exhaustive investigation, I declare the Apollinaris Water, as supplied to the public, to be purely natural in every respect, and of most excellent quality."

DR. THEODOR KYLL, Analytical Chemist, Town Councilor, Cologne (*expert appointed by United States Vice-Consul, October*, 1877), reported that "The Apollinaris Water, as bottled, deserves in every respect the name of an excellent natural acidulated water."

Every Genuine Bottle bears the REGISTERED YELLOW PICTORIAL LABEL of the Apollinaris Company, Limited, London.

To be had of all Wine Merchants, Grocers, Druggists, and Mineral Water Dealers throughout the United States, and Wholesale of

1117-1168 **41 and 43 WARREN STREET, NEW YORK.**

TO SURGEONS AND GYNÆCOLOGISTS.

ABSORBENT COTTON.

We offer to *Physicians* and *Surgeons* a *prepared cotton*, which will prove a valuable adjunct in practice—a *cheap, clean*, and *reaay* mode of making all kinds of local applications, and a *substitute for sponge;* a rapid and effective desiccant, having such an affinity for moisture that it instantly and greedily absorbs any secretion with which it may be brought into contact. *Surgeons* and *Gynæcologists* will at once appreciate the advantage possessed by this article over ordinary raw cotton, which is a repellent of moisture rather than absorbent.

It is *absolutely pure*, free from any reaction and from any foreign matter.

As a *padding for splints*, etc., it facilitates the normal secretions of the skin, while retaining all of the elasticity of the ordinary cotton.

"HANCE BROTHERS & WHITE'S ABSORBENT COTTON comes in for a good word now, because, for several months we have used it with remarkable success—substituting it in all cases for the well-known patent lint. As an absorbent of vitiated secretions and purulent discharges—whether excoriating or non-excoriating—it seems to surpass everything; and we are inclined to believe that it also possesses *antiseptic* properties, so perfectly does it protect the surrounding parts from infection. Our dentists and surgeons are using it. We have used it in dressing wounds and ulcers and burns. In ulcerations of the os and cervix uteri and in leucorrhœa; we have applied it to the os to protect the vagina; we have applied it to the glans-penis in gonorrhœa, and to hard and soft chancres, and have been delighted with its power to cleanse; the parts requiring no after-washing, only a new supply of cotton."—From *St. Louis Clinical Review*, January 15, 1879.

SAVORY & MOORE beg to call the attention of the Profession to some of their Special Preparations, the purity and uniform strength of which are Guaranteed.

PANCREATIC EMULSION,

Prepared in accordance with the direction of the Physician who introduced this purely

MEDICINAL FOOD FOR CONSUMPTION AND WASTING DISEASES.

Pancreatic Emulsion will always take precedence of Cod-Liver Oil, by reason of its introducing the STABLE SOLID FATS INTO THE SYSTEM, instead of the evanescent fluid fats or oils.

Neither Cod-Liver Oil nor EMULSIONS of COD-LIVER OIL can supply the kind of fat necessary for sound and vigorous human life. In addition to this, all the Oily Emulsions are liable to rancidity, and most of them are highly objectionable in consequence of the SAPONIFICATION and ULTIMATE PUTREFACTION, produced by the chemical agents used instead of Pancreatic Juice.

Pancreatic Emulsion (properly so-called), is THE NECESSARY FOOD OF THE CONSUMPTIVE, and the most reliable form of nutriment for counteracting the tendency to Phthisis and other wasting diseases. It presents to the lacteals fat, in essentially the same condition for assimilation and absorption as in a vigorous human frame, and THE AGENT of the important change is THE NATURAL SECRETION of the PANCREAS.

Pancreatic Emulsion may therefore be regarded as Chyle obtained by nature's own process. In certain cases both Cod-Liver Oil and Pancreatic Emulsion are required—one to supply the blood with oil or liquid fat, the other with the more stable solid fats; but it cannot be too strongly urged that both PANCREATIC EMULSION and Cod-Liver Oil are *not to be regarded as Medicines, but as articles of diet*, without which patients, with their defect of health, will as surely starve as healthy persons would if deprived of the most nutritive part of their food.

Pancreatized (Digestive) Cod-Liver Oil. By Pancreatized Cod-Liver Oil, the active digestive principle of the Pancreatic Juice is imparted to it, which renders it in a highly favorable condition for rapid and complete digestion and assimilation, preventing nausea, and largely increasing the beneficial properties of the Oil.

Pancreatine effects the digestion and assimilation of Cod-Liver Oil and Fat, as well as Food generally. This palatable and popular remedy is therefore invaluable to PATIENTS WHO ARE UNABLE TO DIGEST COD-LIVER OIL, and who are thus deprived of its nourishing and invigorating properties.

Pancreatine Wine. An excellent vehicle for taking Cod-Liver Oil and promoting the digestion of it.

NEW HYPODERMIC SYRINGES.

FIG. 48.—No. 2.

These cuts (two-thirds the actual size) represent a New Hypodermic Syringe of our Manufacture. With the exception of the needles, it is of German Silver, a material chosen as possessing, next to steel, the greatest rigidity and durability, while free from liability to oxydation. The barrel is formed by a process peculiar to ourselves, securing uniformity of calibre without soldered joint or seam. It is plated inside and outside with nickel. The piston is packed in the double parachute form, with leather prepared expressly for the purpose. It will be found to retain its elasticity, to operate smoothly, to resist all tendency of fluid to pass above, as of air below it. A nicely-engraved scale upon the piston-rod indicates minims, thirty being the capacity of the syringe.

Syringes Nos. 2, 3, and 4 have also a screw thread upon the piston-rod, and a traverse nut, thereby favoring the utmost nicety in the graduation of doses.

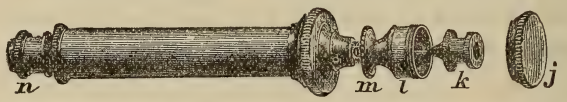
No. 3, Compact, has hollow piston-rod to receive one needle, also a protecting cover and fluid retainer; it may be carried in the Pocket Instrument or Vial Case, or without any case.

No. 4, Compact, is like No. 3, with the addition of a second needle, carried upon the syringe in the usual place, protected by a metal shield.

Nos. 1 and 2 are put up in neat morocco-covered case, with vial.

Two sizes of needles are furnished with each instrument, Nos. 1, 2, and 4; one only with No. 3. They are of refined steel, carefully tempered, and thoroughly plated with gold; they are of small diameter and large relative calibre, sharpened to such an angle as will offer least resistance to penetration, and therefore cause least pain. At the point of union with the socket they are reinforced with an outer covering of German silver, thereby overcoming the tendency to become broken at this place. They are connected with the barrels by a screw thread.

Prices: No. 1, *$3.50* No. 2, *$4.00* Postage, .03
" No. 3, *2.50* No. 4, *3.50* " .02



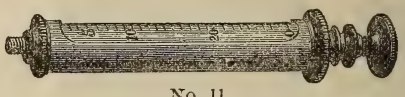
No. 3.

These Syringes are so thoroughly and strongly made as to be free from the annoying accidents common to most Hypodermic Syringes; and we believe that, for convenience, durability, and nicety of construction, they have no superior.

OTHER HYPODERMIC SYRINGES.

		Postage.
No. 7, glass-barrel, graduation engraved on barrel, with screw nut on piston, nickel-plated mountings, two best steel gilt needles, in neat case	*$3.00*	.02
No. 9, glass, graduation engraved and numbered on piston-rod, with screw nut, best steel gilt needles, in neat case	*3.00*	.02
No. 7 or No. 9, with two steel unplated needles, either	*2.50*	.02
No. 10, glass, Luer's (French), graduation as No. 9, one gold needle and two steel needles, silver mountings, neat velvet-lined morocco case	*12.00*	.02

No. 11, glass cylinder, fenestrated, nickel-plated metal mounting (see cut).



No. 11.

As represented in the cut, the glass cylinder is encased in a metal mounting, fenestrated to show the graduations for minims. The instrument may readily be taken apart for cleaning, and for those who prefer glass, is recommended for its non-liability to breakage. Price, with two best steel gilt needles, in a neat case..... *$3.50* Postage. .02

☞ *Any of the above will be sent by return mail on receipt of Price and Postage.* ☜

HYPODERMIC SYRINGES OF ALL KINDS PROMPTLY REPAIRED.

Our new *Illustrated Catalogue of Surgical Instruments,* also a new Pamphlet on Inhalation of Atomized Liquids, by distinguished medical authority, with many valuable formulas, will be forwarded, postpaid, on application.

Atomizers and articles for Antiseptic Surgery, Aspirators, Clinical Thermometers, Elastic Hose, Electrical Instruments, Invalids' Articles, Manikins, Models, Ophthalmoscopes; Dr. Paquelin's Thermo-Cautery; Pessaries, Rubber Urinals; Sayre's Splints, and Apparatus for every kind of Deformity; Skeletons, Sphygmographs, Splints, Transfusion Apparatus; Vaccine Virus from our own stables; Veterinary Instruments; Waldenburg's Pneumatic Apparatus, &c., &c.

CODMAN & SHURTLEFF,

Makers and Importers of Superior Surgical Instruments,

1140-1191eow **13 & 15 TREMONT STREET, BOSTON, MASS.**

The Trommer Extract of Malt Company guarantee to the Medical Profession the excellent quality and absolute reliability of their Extract of Malt. and all its combinations.

Extract of Malt,

WITH COD-LIVER OIL,

FIRST PROPOSED BY DR. F. H. DAVIS, OF CHICAGO,

(See Transactions of American Medical Association, for 1876, page 176.)

Is presented to the medical profession as an efficient, palatable and very stable combination, consisting of equal parts of the ***Extract of Canadian Barley Malt*** and the best quality of genuine ***Norwegian Cod-liver Oil.*** Many patients take this preparation who cannot take the oil in any other form. It may be employed in all cases where Cod-liver Oil is appropriate, but is peculiarly adapted to those complicated with disordered digestion.

Extract of Malt,

WITH COD-LIVER OIL AND PHOSPHORUS,

Consists of equal parts of Extract of Malt and pure fresh Norwegian Cod-liver Oil, Phosphorus being added in the proportion of $\frac{1}{100}$ grain to the dose, and so combined as to be perfectly protected from oxidation. The ***Trommer Extract of Malt Company*** prepare this combination agreeably to the suggestion of ***Dr. Wilson Fox.*** It is specially adapted to cases of phthisis, bronchitis, pernicious anæmia, and diseases of the nervous system.

Extract of Malt,

WITH COD-LIVER OIL AND IODIDE OF IRON

added in the proportion of one grain to the dose. This combination is intended to meet those cases where the physician desires to add a more energetic alterative and restorative to the treatment with Cod-liver Oil and Extract of Malt. The manufacturers have received numerous letters from prominent physicians, referring to it in terms of high praise.

THE WEEKLY
MEDICAL AND SURGICAL REPORTER.

THE MEDICAL AND SURGICAL REPORTER has been established over thirty years, and has, it is believed, a *bonâ fide* subscription list unsurpassed by any medical weekly in America.

It is issued every Saturday, neatly cut and bound, and gives 24 large octavo, doubled-columned pages of reading matter in each number. It claims the following

SPECIAL FEATURES:

IT IS INDEPENDENT, being controlled by no clique, college, society or publishing house.

COSMOPOLITAN. Having subscribers and contributors in every State in the Union, it is edited in the interest of the *whole profession*, not of one section or locality.

EMINENTLY PRACTICAL. Special prominence is given to Diagnosis and Therapeutics—the *recognition* and the *treatment* of disease, the real *business* of the professional man.

UNSURPASSED IN CHEAPNESS. When the *size* and *number* of its pages, and its frequency of issue are taken into account, it gives more matter for the money than any other medical journal in this country.

PARTICULARLY SUITED TO COUNTRY PHYSICIANS. It has always been a special aim of the editor to furnish a journal that would keep a reader remote from medical centres *fully up to the times* in his profession. Every surgical invention and new remedy of value, every medical book of moment, every professional discussion or news item of interest, will be found recorded in its pages. *Contributions* from country physicians are always welcome.

THE HALF-YEARLY COMPENDIUM

Appears on January 1st and July 1st of each year, forming two semi-annual volumes of 300 large octavo pages each, with complete Index. It has been established ten years, with a constantly growing circulation.

☞ While complete in itself, it is also intended as a **Companion Journal to the Medical and Surgical Reporter**; it is made up from articles *which have not been included* in the latter. The one journal is the Complement of the other.

From 600 to 700 separate articles appear each year in its various departments, carefully prepared, and giving the choicest selections from all sources, American and Foreign. It is the *only* work of the kind which does justice to *American* writers in medicine.

BETHESDA WATER.

We claim Bethesda to be a specific in all cases of Diabetes, Inflammation of the Kidneys, Inflammation of the Bladder, Inflammation of the Neck of the Bladder and Urethra, Dropsy, Gouty Swellings, Stoppage of Urine, Incontinence of Urine, Albuminuria, Ropy or Cloudy Urine, Brick-dust Deposit, thick, morbid, bilious and dark-appearing Urine, with bone-dust Deposits, burning sensation with sharp pains when voiding the Urine, Hemorrhage of the Kidneys, Pain in the Kidneys and Loins, Torpid Liver, Indigestion, Calculus and Female Weakness.

What the Medical Profession Say.

MILWAUKEE TESTIMONIALS.

(Milwaukee is 20 miles from the Spring.)

What Surgeon-General Wolcott and other prominent medical men say about the Bethesda Water:—

DR. WOLCOTT—Dear Sir: My attention has lately been called to the Bethesda Mineral Water, of Waukesha, as a remedy for Diabetes, Bright's Disease, etc., and I desire, in behalf of an afflicted friend, to ask of you the favor of submitting briefly your views of its merits, or its claims to the confidence of the profession as a medical agent in the maladies named, and you will much oblige, J. W. RIGGS, M.D.

J. W. RIGGS, M.D.—Dear Sir: Many cases of Diabetes and other forms of Urinary Disorders have been cured or greatly relieved by the use of the water; so much so that the Spring has already a wide-spread reputation. What time may do, either in sustaining or destroying this rapidly acquired reputation, remains to be seen. It is a test too severe for most very rapidly famous remedies, but this may, nevertheless, stand it. Very respectfully,

E. B. WOLCOTT, M.D.

Two years after the above was written, Dr. Wolcott says—

I am gratified to find that the opinion given by me over two years ago, on the medical properties of the Bethesda Water, has been fully sustained and confirmed by its use, in a vast number and great variety of cases involving the urinary organs. In many, nay, in most of such cases, I do not hesitate to say that it is vastly superior to any other remedy known to the profession. E. B. WOLCOTT, M.D.

We fully concur in the above.

O. P. WOLCOTT, M.D.
J. E. GARDNER, for diabetes.
H. XELOWSKI, M.D.
J. M. ALLEN, M.D.

What Dr. Thompson (late Surgeon in charge of National Asylum) says about the Bethesda Water:—

I have known many acute and Chronic diseases of the kidneys and urinary organs permanently relieved by the use of Bethesda Spring Water after resisting ordinary medical treatment. I regard the water as possessing remarkable medicinal properties, and have observed its effects for the past two years.

J. H. THOMPSON, M.D,
Late Surgeon in charge National Asylum, 210 Wisconsin street, Milwaukee.

What Dr. Marks (late President Wisconsin Medical Society) says about Bethesda Water:—

During the past two years I have prescribed Bethesda Water for quite a number of patients who were suffering from diabetes, and unhesitatingly pronounce it *the best* remedy I have used for that disease.

S. MARKS, M.D.

General Agent for this Water, for the States of Pennsylvania, Indiana, Ohio, West Virginia, New Jersey and Maryland—

SCOTT'S EMULSION

PURE COD LIVER OIL

WITH

HYPOPHOSPHITES OF LIME AND SODA

PERFECT, PERMANENT, PALATABLE.

We respectfully ask the Medical Profession to give the above preparation a trial, knowing they will find it just the thing long desired, and obtain splendid results in the wasting diseases indicated by malnutrition and assimilation. The *perfect* and *permanent* union of the Cod Liver Oil with the Hypophosphites, and the thorough manner in which the nauseous taste is disguised, renders it so palatable that the most delicate stomach can retain it. The notable advantage it possesses over all other preparations, is its *permanency* as an *emulsion*, remaining for an almost unlimited time without the slightest separation or change, which enables the Physician always to prescribe it in its proper proportions. The oil is prepared expressly for us, and guaranteed strictly pure. We will gladly furnish, express paid, a 4-oz. sample to any Physician in the country who may not have been supplied.

Formula.—50 per cent. of pure Cod Liver Oil, 6 grs. of the Hypophosphite of Lime, and 3 grs. of the Hypophosphite of Soda to a fluid ounce.

SCOTT & BOWNE,
Manufacturing Chemists, 125 Hudson Street, N. Y.

Messrs. SCOTT & BOWNE: NEW YORK, September 4, 1876.

Gents—I have prescribed Scott's Emulsion of Cod Liver Oil with Hypophosphites in both private and hospital practice, and consider it a valuable preparation. It remains as a permanent emulsion, even in extremely hot weather, and is more palatable than any other preparation of oil that I have used. Yours, very respectfully,
ROBERT WATTS, M.D., President Medical Board, Charity Hospital.

Messrs. SCOTT & BOWNE:

Gentlemen—Having given your Emulsion of Cod Liver Oil and Hypophosphites of Lime and Soda a fair trial during the past eighteen months, am very much pleased with the same, and consider it the best preparation of the kind in the market.
Yours, truly, J. H. HARTMAN, M.D., Baltimore, Md.

We also refer to the following Physicians, who use it and recommend it to the Profession:

G. C. SHATTUCK, M.D., 18 Stamford Street (Late Visiting Physician, Mass. General Hospital).
J. AYER, M.D., No. 6 Hancock Street, Boston.
G. W. GAY, M.D., 575 Tremont Street (Visiting Surgeon Boston City Hospital).
F. E. BUNDY, M.D., 99 Waltham Street, Boston.
W. B. MACKIE, M.D., 675 Tremont Street, Boston.
J. A. OCTERLONY, M.D., Louisville, Ky.
J. SIMONAUD, M.D., New Orleans.
G. LANE TANEYHILL, M.D., Baltimore.
EDWARD A. MARIS, M.D., Baltimore.

LONDON MF'G CO.'S ESSENCES OF MEATS

FOR INVALIDS, INFANTS AND TRAVELERS.

ESSENCE OF BEEF, MUTTON, CHICKEN.

These Essences are the finest juices from choice meats, entirely free from fatty or injurious matter. They retain the fine flavor and smell of the meats. Are heavy liquids in a warm temperature and when placed upon Ice take a jelly form especially grateful to invalids. Children will readily take them, and in many of their complaints Essences are unequaled. Being used **WITHOUT WATER,** *they do not cause nausea as does Beef Tea, and they will remain upon the stomach when all other nourishment is rejected. In mental or physical prostration they act as strong stimulants, without the subsequent injurious effects produced by alcohol. In Dyspepsia and all Chronic Diseases of the Stomach, they are easily assimilated and are helpful in Consumption and other wasting diseases. Natural, pleasant and refreshing in fevers. Afford concentrated meat stimulant after child-birth. Are convenient for persons boarding or traveling.*

Taken cold direct from the can, needing no preparation whatever.

Sold by Druggists and Fine Grocers.

TO THE MEDICAL PROFESSION.

LACTOPEPTINE,

The most important remedial agent ever presented to the Profession for Indigestion, Dyspepsia, Vomiting in Pregnancy, Cholera Infantum, Constipation, and all diseases arising from Imperfect Nutrition, containing the five active agents of digestion, viz.: Pepsin, Pancreatine, Diastase, or Veg. Ptyalin, Lactic and Hydrochloric Acids, in Combination with Sugar of Milk.

FORMULA OF LACTOPEPTINE.

Sugar of Milk.....40 ounces.	Veg. Ptyalin or Diastase.....4 drachms.
Pepsin..... 8 ounces.	Lactic Acid.....5 fl. drachms.
Pancreatine..... 6 ounces.	Hydrochloric Acid.....5 fl. drachms.

LACTOPEPTINE owes its great success solely to the Medical Profession, and is sold almost entirely by Physicians' Prescriptions. Its almost universal adoption by the Profession is the strongest guarantee we can give that its therapeutic value has been most thoroughly established.

The undersigned having tested LACTOPEPTINE, recommend it to the Profession:—

ALFRED L. LOOMIS, M.D.,
Professor of Pathology and Practice of Medicine, University of the City of New York.

LEWIS A. SAYRE, M.D.,
Professor of Orthopædic Surgery and Clinical Surgery, Bellevue Hospital Medical College.

F. LE ROY SATTERLEE, M.D., PH.D.,
Professor of Chem., Mat. Med. and Therap. in the N. Y. College of Dent.; Prof. of Chem. and Hygiene in the Am. Vet. College, etc., etc.

SAMUEL R. PERCY, M.D.,
Professor Materia Medica, New York Medical College.

A. VAN DEVEER, M.D.,
ALBANY, N. Y., June 8th, 1878.
Prof. of the Prin. and Prac. of Surg., Albany Med. Col.; Surg. Albany and St. Peter's Hospitals.
"I have given LACTOPEPTINE a good thorough trial, and have been greatly pleased with the excellent results that have followed its administration."

JOHN H. PACKARD, M.D.,
PHILADELPHIA, PA., May 30th, 1878.
Pres't Phila. Co. Obstet. Society; Surg. Episcopal and Women's Hospitals.
"I have found great satisfaction in the use of LACTOPEPTINE, and have ordered it frequently in cases of Dyspepsia, especially where there is want of tone and defective secretion."

JAS. AITKEN MEIGS, M.D.,
PHILADELPHIA, June 20th, 1878.
Prof. of the Institutes of Med. and Med. Juris., Jeff. Medical College; Phy. to Penn. Hos.
"I have used LACTOPEPTINE with very good effect in a number of cases of Dyspepsia."

W. W. DAWSON, M.D.,
CINCINNATI, O., June 21st, 1878.
Prof. Prin. and Prac. Surg., Med. Col. of Ohio; Surg. to Good Samaritan Hospital.
"I have used LACTOPEPTINE with great advantage in cases of feeble digestion."

ALBERT F. A. KING, M.D.,
WASHINGTON, D. C., June 19th, 1878.
Prof. of Obstetrics, University of Vermont.
"I have used LACTOPEPTINE both in hospital and private practice, and have found it to answer fully the purposes for which it is recommended. As an immediate aid to the digestive function, I know of no remedy which acts more directly."

D. W. YANDELL, M.D.,
LOUISVILLE, KY., March 7th, 1878.
Prof. of the Science and Art of Surg. and Clinical Surg., University of Louisville.
"I have made much use of LACTOPEPTINE, and take great pleasure in stating that it has rarely disappointed me. I shall, of course, continue to prescribe it."

ROBT. BATTEY, M.D.,
ROME, GA., June 8th, 1878.
Emeritus Prof. of Obstetrics, Atlanta Med. College, and Ex-Pres. Med. Association of Ga.
"I have used LACTOPEPTINE in a case of Dyspepsia with satisfaction. I think well of it."

CLAUDE H. MASTIN, M.D., LL.D.,
MOBILE, ALA., June 8th, 1878.
"I consider LACTOPEPTINE the very best preparation of the kind which I have ever employed, and for patients with feeble digestion I know of nothing that is equal to it."

Prof. H. C. BARTLETT, PH.D., F.C.S.,
LONDON, ENG., February 22d, 1876.
"I find the preparation of LACTOPEPTINE contains within itself all the principles required to promote a healthy digestion.

PRICE LIST.

DIFFERENTIAL DIAGNOSIS;

A MANUAL OF THE

COMPARATIVE SEMEIOLOGY

OF THE MORE IMPORTANT DISEASES,

BY F. DE HAVILLAND HALL, M. D.,

Assistant Physician to the Westminster Hospital, London.

American Edition, with Extensive Additions.

One Volume, 8vo., pp. 205. Printed on handsome tinted paper; bound in English pebbled cloth, with beveled boards. Price $2.00.

SENT BY MAIL, POST-PAID, ON RECEIPT OF THE PRICE.

DR. HALL'S work has received the highest encomiums from the English medical press, for its lucid arrangement, completeness, and accuracy. He himself is known in London as a practitioner of great skill, and an unusually successful medical teacher. His work has been considerably enlarged in this edition, the editor having devoted especial attention to (1) pointing out the *early* and often overlooked symptoms of disease (2), enumerating the *pathognomonic* symptoms, and (3) bringing into relief the *peculiar features* of diseases in this country.

Most of the diseases which may be confounded are presented in comparative tables, setting forth their distinctive characteristics in the clearest possible light, and thus greatly facilitating their prompt diagnosis.

THE CONTENTS follow, in a general way, the nomenclature of the College of Physicians: thus the work is divided into two parts, the one on General Diseases, the other on Local Diseases.

The First Part contains, among other matters—

The Symptoms of the Febrile State Defined. Comparative Table of the Temperature and Pulse in the Leading Febrile Diseases. Differences between Symptomatic and Essential Fever. Tabular Comparison of Rötheln, Scarlet Fever, Measles, and Smallpox. Comparison of the Symptoms of Typhoid and Typhus; of Typhoid and Malarial Fever; of Typhoid and Typho-Malarial; of Typhoid Fever and the Typhoid State; of Typhoid and Relapsing Fever. Diagnosis between Epidemic and Sporadic Cerebro-spinal Meningitis; between Epidemic Meningitis and Typhus; between the Same and Congestive Malarial Fever. The Signs of the Arthritic, the Scrofulous, the Syphilitic, and the Tubercular Dyscrasiæ. Gout, Rheumatism, and their Allies.

The Second Part includes the Diagnosis of Local Diseases; embracing, for example—

The Differential Points between Hemorrhage, Thrombosis, and Embolism in the Brain; between the various forms of Sclerosis, Syphilosis, Paralysis, and Ataxy of the Spinal Cord; and between Organic, Functional, Toxic, and Hysterical Paralyses. These extremely difficult problems in diagnosis are set forth with the utmost clearness.

Neuralgia and its Counterfeits (myalgia, spinal irritation, cerebral abscess, alcoholism, hysteria, etc.)

Diagnostic Table of Acute, Chronic, Syphilitic, and Tubercular Laryngitis, Perichondritis, Benign and Malignant Growths, and Neuroses of the Larynx. Distinctions between Inflammatory Croup and Spasmodic Croup, on the one hand, and Membranous Croup and Diphtheria, on the other. Catarrhal as Distinct from Parenchymatous Tonsillitis.

Normal and Abnormal Chest Sounds (in all, eleven very carefully prepared tables). Dr. John Hughes Bennett's General Rules for Diagnosing Heart and Lung Affections. Comparison of the Three Forms of Phthisis. The Diagnosis of Incipient Phthisis (sixteen different signs are given of its very earliest stage). Differential Diagnoses between Incipient Phthisis and Bronchitis; between Acute Phthisis and Typhoid Fever; between Capillary Bronchitis and Pneumonia; between Pneumonia and Pleurisy; Pneumothorax and Pneumo-Hydrothorax, etc.

Dr. Dobell's Aphorisms on the Significance of Pain at and near the Heart; his Aphorisms on the Significance of Clubbing of the Finger Ends. Diagnosis between the Various Cardiac, Aortic, and Mitral Diseases. The Cheyne-Stokes Respiration Discussed.

To Distinguish Acidity of the Stomach from Fermentation and from Hypersecretion; Stomachal Vertigo from Cerebral Vertigo; Gastric Vomiting from Cerebral Vomiting. Comparative Symptoms of Atonic Dyspepsia, Chronic Gastritis, Gastric Ulcer, and Gastric Cancer. Special Points in the Diagnosis of Gastric Cancer. Abdominal Phthisis as Distinguished from Typhoid Fever. The Diagnosis of Hepatic Diseases. Hardy's Handy Tests for Bile in the Urine. What Pain in the Liver may Signify. What Jaundice may Signify. Hepatic Diseases Classified with Regard to the Size of the Liver. The Seven Forms of Bright's Disease Compared. The Four Forms of Diabetes Compared. The Kinds of Calculi and their Tests, etc.

The *British Medical Journal*, says:—"This is not of the type of books brought out by 'grinders.' The tables it contains are invaluable aids by the bedside, enabling the student and practitioner readily to compare signs met with in disease."

The *North Carolina Medical Journal*, says:—"The tabular method of comparing symptoms is well utilized. Very many valuable diagnostic formulæ are brought together."

The *Atlanta Medical Journal*, says:—"The comparative symptoms are given in a very satisfactory manner. The work will afford valuable aid to practitioners."

13.

Supporters E. C. or Economy.—Fig 5, on its elastic belt Z, is the least in price, and by the oblique construction of the cup sets direct within the angle of the axis of the uterus and vagina, (well seen by IU. Fig. 13) If properly selected, or made so by the exchange privilege, (which admits the interchange of all the hard rubber parts in the catalogue, to cover the purchaser's risk.) It is warranted to correct and sustain even any ***Procidentia.*** The spring stems and shifting tops with their supplements, Fig. 1. Also, improved ***Retroversion, Cup E. Antervversion C.*** and ***Intra-Uterine Stem Cup, IU,*** Fig. 13. The stem locks in a square socket after the cup is in position, and is supported on the elastic gums SS, as A Fig. 1, and same in price. Stem Levers, Fig. 14, etc. All are fully explained in the catalogue. The ***Series*** comprises upwards of 150 in style and size instruments, of which two-thirds belong to the support and correction of the uterus. ***Speculums***—Thomas' objections p. 67—'76, are by them completely overcome. The case contains four. The clear and large view, and facility to work through them, far exceeds any other. The ***Ex. Case,*** and physician's favorite, is admirably represented by Fig. 12—weight but 4 oz. ***Catalogue*** sent free on application. In addition to the description of the above series of instruments, it contains important information on this line of treatment.
